GEO. O. MADIGAN,
F. BATH,
F. BIGGAM,
JOHN O'NEILL,
Inspectors of Steam-boilers, District D.

Inspector's Report, District E.

VERNON, B.C., April 1st, 1921.

John Peck, Esq.,
Chief Inspector of Machinery, New Westminster, B.C.

SIR,—I beg to submit the following report of work done in District E during the year ending March 31st, 1921:—

There have been no boiler or engine-room accidents resulting in injury to employees or others, but one boiler at Williams Lake was seriously damaged by overheating, caused by low water.

Until a month ago my headquarters were in New Westminster, but this was uncentral and it was quite impossible to satisfactorily control this very large district.

Now that my office has been placed at Vernon, at least some parts of my district are more satisfactorily controlled. There is yet a very large district north of Kamloops and Ashcroft which can only be visited once a year, so that the proper care of the plants in this district is entirely in control of the engineers. There is again farther north a district not yet visited, the Peace River District, and during the coming year it is my intention to go, at your request, and inspect any boilers I may find there.

This will entail a revision of my programme of work and may mean that I shall be unable to visit some of the plants, at least, in the Cariboo.

You will understand that this is a difficult district in which to arrange work satisfactorily, as in a large part of the district it is hardly possible to begin inspections until April is well advanced, and the work must be completed before winter begins.

The present arrangement, although not ideal, is better for the carrying-out of the work of the district, as I can give more immediate attention to a large section of my district.

There has been a number of accidents to employees in mills and other workshops which I have investigated for the Commissioner of the Workmen's Compensation Board.

I find that mill-owners, at least the large mill-owners, are very friendly indeed towards the "Workmen's Compensation Act," and have of their own volition in some cases made great improvements in their safeguards. The standard of accident-prevention is being greatly increased.

Trusting that this report may prove satisfactory,

I have, etc.,

JAS. DAVIDSON,

Inspector, District E.

SUMMARY OF WORK DONE IN DISTRICT E FOR YEAR ENDING MARCH 31ST, 1921.

Number of drawings and specifications calculated for new boilers	10
„ new boilers inspected built in United States	1
„ new boilers inspected built in British Columbia	2
„ new boilers inspected (total)	3
„ boilers imported from Eastern Canada (second-hand)	1
„ first inspections	19
„ inspections, external and internal	271
„ visits in addition to inspections	61
„ boilers subjected to hydrostatic test	213
„ boilers on which pressure was reduced	6
„ boilers unsafe without extensive repairs	9
„ boilers repaired under Inspector's directions	6
„ inspections completed	270
Total horse-power of boilers inspected	15,195
Number of defects observed as per summary	57
Number of defects considered dangerous	13
Inspection fees earned	$2,274.44
Inspection fees collected	$2,085.95
Miles travelled by the Inspector	7,743

WORK DONE FOR OTHER DISTRICTS.

Assisted at examinations in District A.

SUMMARY OF DEFECTS OBSERVED.

Nature of Defects.	Number.	Dangerous.
Boilers with safety-valves overloaded	1	1
Boilers with safety-valves defective in construction	1	..
Pressure-gauges inoperative	3	3
Pressure-gauges defective	8	..
Cases of insufficient staying or bracing	5	2

REPORT OF INSPECTOR OF ELECTRICAL ENERGY.

OFFICE OF INSPECTOR OF ELECTRICAL ENERGY,
COURT-HOUSE, VANCOUVER, B.C., August 1st, 1921.

J. E. Griffith, Esq.,
Deputy Minister of Public Works, Victoria, B.C.

SIR,—I have the honour to submit the following report on the work of this office for the year ending March 31st, 1921:—

GENERATING PLANTS.

During the year five electrical generating plants of small capacity have been put in operation for the first time, bringing the total number now operating in the Province to 100. In three instances additional generating units have been added to existing power-stations, bringing the total generator capacity up to approximately 244,000 k.v.a. There are now sixty-three plants engaged entirely or in part in giving a public supply of electrical energy, and thirty-seven plants operated solely for electrical supply to factories, mills, pulp plants, mines, etc. There are forty-four plants operated by water-power, forty-six by steam-power, and ten by internal-combustion engines. Hydro-electric plants represent by far the largest proportion of the station capacity, 77 per cent. of the total installed k.v.a. generator capacity being of that type.

The harnessing of the water-powers of the Province for the production of electrical energy continues to progress and several power developments are at present under way. The Bridge River Power Company, following upon a change in financial control, commenced work during the year on the Bridge River project. Preliminary work on the location of the power-house and dam-site has been undertaken and field-survey work on the contemplated flooded area above the dam-site has been carried out. This is one of the largest possible developments in British Columbia and its completion will furnish an important industrial asset throughout a large portion of the Province. With the increase in population and industrial development in the Vancouver District, utilization of power there from the Bridge River may be necessitated, and it is also expected that this power-development will attract to within its territory various industries requiring large amounts of electrical energy at low rates for special manufacturing processes. The development will be undertaken in two or possibly three stages, the initial stage giving approximately 60,000 horse-power and the final and complete development approximately 300,000 horse-power.

Preliminary work is also being carried out in the development of electrical power on Bull River at a point about 20 miles east of Cranbrook. The water-power rights there have been acquired by the British Columbia & Alberta Power Company, Limited, which contemplates giving a supply of electrical energy in bulk throughout a territory extending from the Sullivan Mines at Kimberley to Blairmore in Alberta. Contracts are at present under negotiation with the Cities of Cranbrook and Fernie and with the colliery companies operating at Coal Creek, Michel, and Corbin. About 140 miles of transmission-line at 66,000 volts will be constructed, of which over 100 miles will be in British Columbia. Preliminary plans have already been submitted to this office, and it is expected that the development will be completed by the end of 1921. The same company also proposes developing other powers in its territory and tying these in with the Bull River system. The supply of electrical energy at low rates in the eastern section of British Columbia will do much to stimulate development there. With the increasing difficulty attending the remunerative operation of the small steam plants in Cranbrook and Fernie, it is expected that with the purchase of electrical energy in bulk, and the discontinuing of their own steam-driven plants, financial improvement in the electrical-supply departments in these cities will result.

The extension of the high-voltage transmission-line system of the West Kootenay Light and Power Company, Limited, from Greenwood to Allenby, and mentioned in my previous reports, has now been completed. The construction of this line was followed by this office throughout its progress, and its completion has constituted a notable addition to the electrical transmission-line

systems of the Province. While the principal objective of this line has been the plant of the Canada Copper Corporation at Allenby and Copper Mountain, its construction through the Southern Okanagan and Similkameen Districts conveys an added potentiality to these regions. The local supply company at Princeton has discontinued the operation of its steam plant and now purchases electrical energy in bulk from the West Kootenay Light and Power Company over the above line.

This company has an additional scheme of expansion in view leading towards electrical supply in the various towns in the Okanagan Valley. A contract has been made with the City of Penticton, and others are in negotiation with the City and Municipality of Summerland, the District of Peachland, and the Cities of Kelowna and Vernon. By the close of the present year it is expected that the company will be supplying the City of Penticton over a branch line connected with the Princeton high-voltage line. The West Kootenay Light and Power Company, being in possession of the splendid power resources at Bonnington Falls, has done much in the past to further the development of the Boundary country, and the extension of its field to the Similkameen and Okanagan Districts may also be expected to give an important impetus to development there.

During the year under review the Western Power Company of Canada, with its power plant on the Stave River and its extensive transmission-line and distribution system, has passed to the control of the British Columbia Electric Railway Company, Limited. With this change the development of the former company's second power-site on the Stave River is brought nearer to accomplishment, as the power there available will be necessary for the supply of the constantly increasing demand on the system of the British Columbia Electric Railway Company, Limited.

With the development of the British Columbia & Alberta Power Company's system in the eastern section of the Province, and other extensions and approaching developments mentioned above, indications are that the time is not far distant when the whole width of the Province from the Coast to the Alberta boundary will be traversed by high-voltage transmission-lines.

TRANSMISSION AND DISTRIBUTION.

In addition to the transmission-line work mentioned above, several short sections of 34,000- and 60,000-volt lines have been constructed by the British Columbia Electric Railway Company, Limited, in Vancouver and Victoria Districts, and also several extensions at 11,000 volts to consumers requiring large amounts of power have been built. With the curtailment of building operations during the year, the amount of extension of distribution-lines at voltages under 10,000 volts has not been great, being confined to short extensions in suburban and outlying districts. Farmers and rural municipalities continue to evince an appreciation of the advantages of electrical supply, as evidenced by the additional extension of the British Columbia Electric Railway Company, Limited's, lines in the Fraser Valley and Lulu Island Districts.

All new overhead-line construction now being carried out in the Province is of a much-improved standard, especially in the case of the work done by the larger companies. Our rules on overhead construction are now in the hands of all power companies and cities owning overhead wires. In the case of smaller companies and municipalities, there has been an increased appreciation of the importance of employing qualified linemen periodically, if not permanently, and this has resulted in a remodelling of much of the overhead-line work. New poles have been set, wires pulled up, and corner poles recross-armed and rewired, resulting in an improvement in safety both to the public and to employees, and also in considerable improvement to the appearance of many streets.

There are now approximately 2,600 miles of power-transmission and distribution lines in the Province.

UTILIZATION EQUIPMENT.

This includes all electric motors, machinery, apparatus, etc., supplied or operated by electric current for the production of power, heat, light, etc. Power equipment of 220 volts and over has, as usual, received more attention than lower voltage wiring and equipment. There is now an installed capacity of electric motors in the factories, workshops, sawmills, pulp-mills, etc., of the Province totalling approximately 200,000 horse-power. It has been in connection with this electrical equipment that probably the greatest advancement and improvement in installation practice has been made during the past year. A large amount of renovation of existing wiring and installation has been made. All defective power-wiring, open switches, fuses, etc., and faulty

distribution of circuits have been remedied immediately upon being revealed by inspection, and new work is now being carried out in accordance with the safety requirements of this office as enacted both under the "Workmen's Compensation Act" and the "Electrical Energy Inspection Act." The use of externally operated switches for all circuits of 220 volts and over is now universal in all new installations throughout the Province, and the elimination of all previously installed old type switches is progressing. In reinspection of old power-wiring, especially in outlying districts, we have not always called for complete remodelling in accordance with present-day standards, but have in some cases found the demands of safety to have been satisfied by the remedying or replacement of dangerous features.

RULES AND INSPECTION.

An extension of existing rules has been prepared to cover the particular hazards arising in power-houses and will be issued in printed form during the coming year. Since the preparation of our rules on overhead-line construction the third edition of the National Electrical Safety Code has been issued, and following on minor modifications suggested by that Code, our overhead rules will also shortly be obtainable in printed form. These rules have been circulated in preliminary form for some time and appear to satisfactorily cover the different forms of construction found in various places through the Province. In their bearing on existing construction it has not been found possible to stipulate a definite period within which conformity to the rules shall be given, but special orders will be issued from time to time calling for removal of particular hazards.

The work of the office has increased considerably during the past year in the direction of covering by inspection electrical plants and wiring of lower voltages than those hitherto considered as requiring the attention of the office. This has been necessitated for various reasons, one being that while fatal or serious accidents at lower voltages rarely occur, still minor accidents have resulted, and our present system of recording and investigating all such accidents has brought into prominence the necessity for frequent guarding of equipment down to voltages as low as 110 volts. Further, we have found it necessary to give attention to the fire hazard which may be produced by defective wiring, both in industrial and commercial premises and in residences. In pursuance of this a large number of inspections of old wiring at 110 volts has been made throughout the Province and orders issued for removal of all defective features.

All cases of fires allegedly caused by defective wiring have been reported to this office and investigated and reports issued.

It is our intention to issue a set of regulations governing low-voltage wiring, and along the lines of the National Electrical Code. We have made this Code, supplemented by our additional specification which we have issued, the basis of our requirements, and have had discussions with the National Board of Fire Underwriters regarding modifications to the Code to include our special requirements. Our original intention was to issue a complete Code, different entirely in arrangement, and to a great extent in substance, from the National Electrical Code, but due to the latter having established itself in electrical-wiring practice throughout the country it has been decided to use it as a basis.

Inspection of installations in outlying municipalities is now more in hand through the co-operation of the Municipal Councils, but considerable difficulty is still experienced in getting in touch with all installations previous to commencement. Until such time as we are in a position to initiate a complete permit system for all electrical wiring, it is inevitable that some residence wiring in outlying parts of the Province may temporarily escape supervision. The incurring of the expense which would be entailed in inspecting all installations of 110-volt wiring in outlying parts of the Province is, we consider, in many cases at present not warranted. Our system by which we insist on obtaining the approval of the Department for construction of pole-lines on Provincial highways, and the issuing of permits for such, continues in satisfactory operation and records are kept of all such lines.

ACCIDENTS.

The following are the electrical accidents reported and investigated throughout the year:—

Occupation.	Place.	Date.	Cause and Remarks.
		1920.	
Repairman	Britannia Mines	April 11	Working on locomotive with power on; flash in eyes.
Helper to chief operator	Western Power Co. of Canada	„ 13	Ladder came in contact with high-voltage wire; result fatal.
Machine operator	Lumber Products Co.	„ 29	Defective switch; burned hand and eyes.
„	„ „	June 12	Burned hand on switch.
Switchman	Britannia Mines	July 19	Caught hold of trolly-wire; severe shock.
Lineman	B.C. Electric Railway Co., Ltd.	„ 24	Short circuit on switch on pole; burned hands and face.
„	Consolidated Mining & Smelting Co.	Aug. 3	Severe burn to hand and thigh.
Operator	„ „	„ 15	Operating rectifiers; severe shock and burn.
Electrician	Canadian Puget Sound Lumber Co.	Sept. 16	Lead burning; injuries to eyes.
Mine employee	Belmont-Surf Inlet Mines	„ 21	Faulty operation of knife-switch; burned right hand and flash to eyes.
Labourer	Ocean Falls	Nov. 18	Short in switch; right wrist burned and flash in eyes.
Boy	New Westminster	„ 27	Defective key-socket; fatal.
		1921.	
Operator	B.C. Electric Railway Co., Ltd.	March 10	Eyes burned, due to flash.
Lineman	City of Kamloops	„ 30	Came in contact with 2,300-volt wires on pole; fatal.

GENERAL.

During the year under review a considerable amount of attention has been given to the proposal to have electrical contractors and electricians subject to a Provincial licence. In pursuance of this, meetings and discussions have been held with various electrical organizations affected and a study has been made of corresponding legislation elsewhere. Our draft of the proposed measure has been much discussed, but several sections have failed to meet with general acceptance. It is considered that such legislation, if enacted, would operate widely as a safety measure in addition to contributing to ensuring a higher standard of electrical-installation work, especially in the outlying parts of the Province. This matter is receiving further attention and it is hoped at a later date to present an improved draft of such a scheme of licensing.

The Code of Lighting which was prepared last year has been made the basis for a number of installations, with satisfactory results, and the matter of designing and laying out new schemes of illumination now shows a tendency to be undertaken on a more satisfactory basis. A considerable amount of educative work, however, is necessary, preparatory to a general appreciation of the importance of adequate illumination. In a large number of cases it has been found that lack of adequate provision of sufficient lighting when wiring installations have been made has resulted in both life and fire hazards through overloading of circuits and unauthorized extensions to wiring. The Code will be issued in slightly revised form at an early date.

The usual amount of advisory work on electrical matters outside the scope of the "Electrical Energy Inspection Act" has been carried out during the year for the office of the Supervising Architect, Fire Prevention Officer, Inspector of Dykes, the Workmen's Compensation Board, and other offices and departments.

I have etc.,

J. MUIRHEAD,

Inspector of Electrical Energy.

REPORT OF INSPECTOR OF FACTORIES.

VANCOUVER, B.C., March 31st, 1921.

Hon. J. H. King,
Minister of Public Works, Victoria, B.C.

SIR,—In submitting another annual report of this Department, it is rather difficult to state anything that is new or original and at the same time to avoid a sameness with other reports, as our duties are to a certain extent of a routine nature.

The safeguarding of dangerous machinery forms one of the most important features of factory inspection. Good judgment is required when ordering guards to be installed; the hazard has to be determined and the guard so arranged that it will not interfere with production. This at times presents rather a complex problem, and quite frequently means that we are called upon to design a guard which will at times be automatic and positive in action, and when installed will comprise a self-contained piece of machinery.

As our duties require us to inspect all sorts of industries, it follows that we are required to have at least a technical knowledge of the process of all the manufacturing industries of the Province. Possessed of this knowledge, it enables us to discuss with the management and employees, from the humanitarian as well as the monetary point of view, the problems in guarding against hazards which confront the industry.

In our previous reports we have stated that each succeeding year has brought improvement in the working conditions of the industrial employees of the Province, and the year just closed has shown a marked improvement in that respect. This is due in no small measure to the co-operation with us of the various foremen and executives of the industries over which we have jurisdiction. Without this co-operation we would be unable to get the results for which we are striving.

As new industries are being established and additions to the older plants being made, it is obvious that our duties have multiplied to a corresponding degree. Notwithstanding this additional work, no increase in the number of the staff of this Department has been made. This difficulty, however, could be overcome by the placing of an automobile at the disposal of this office. At present we are dependent on local transportation service to convey us to the numerous plants, and it naturally follows that a great deal of time is lost that otherwise would be saved. An automobile would be of more service to us than an additional Inspector.

ELEVATORS.

The duties of this Department do not end with the responsibility of looking after the safety and welfare of the workmen employed in the factories throughout the Province, but we are charged with the further responsibility of being the custodians of the public's safety in so far as enforcing the rules and regulations pertaining to the upkeep and operation of passenger-elevators is concerned. When it is realized that thousands of persons are carried daily by this means of conveyance, it will be admitted that it is most desirable to adopt all practical safeguards.

One of the most beneficial pieces of legislation respecting the operation of passenger-elevators was the amendment to the Act whereby it was made compulsory for the operators to pass an examination before being granted a licence to operate an elevator. That this is an effective method of preventing accidents is most conclusively proven by the fact that we have not had to investigate a single accident caused by passenger-elevators during the past year. Notwithstanding the fact that elevators are placed in charge of competent operators, these employees are only human, and should they momentarily forget to perform the duties required of them a serious or fatal accident is frequently the result.

As stated in my last report, statistics and our own past experiences show that the majority of accidents occur at the elevator landings when passengers are entering or leaving the car, and as the large majority of elevator installations in British Columbia are of such a nature that the car can be started before the doors are closed, there is always the possibility of the chance-

taker (and they are numerous) attempting to board a car after it has started. The inevitable result of such an action is to be crushed either between the car platform and the top of the door-frame when the car is ascending, or between the top of the car and the floor when descending.

The statistics of fatal elevator accidents occurring in Canada and the United States show that 43 per cent. of the victims are killed by falling down the shaft and 42 per cent. by being crushed by the car. The only practical and effective method of preventing accidents of this nature is to equip all passenger-elevators with an electric or mechanical interlock, so arranged that it will prevent the operation of the car before the door or doors are closed and locked.

HOURS OF LABOUR.

As the hours of labour in certain industries are limited, a great many night and early-morning inspections have to be made in order to see that the law is being observed. The amendment to sections 3 and 66 of the "Factories Act," which was made at the 1920 session of the Legislature, and which relates to the hours in which a laundry may be open for business, was the means of taking up a great deal of the time of this Department. The proprietors of the Oriental laundries in this city engaged legal counsel to contest Police Court cases which, after inspection, were brought against them for violation of the Act. Before some of the owners of these laundries were convinced that the law governing the operation of laundries must be adhered to, it was necessary to prosecute them several times before a strict observance of these provisions was attained. We were early convinced that if for any reason we were unable to devote sufficient time for these inspections the law would be ignored and they would work an unlimited number of hours. In this connection some seventy prosecutions have been made and fines amounting to $1,167 imposed.

The law governing child-labour and the employment of young girls and women in factories for more than eight hours in one day or more than forty-eight hours in any one week has been rigidly enforced, no prosecutions being necessary for violation of these sections of the Act.

With regard to sanitation, ventilation, and lighting, these important matters have been given our constant surveillance, and where alterations and improvements were found necessary instructions for same have been issued from this office.

In conclusion, I wish to thank you and the Deputy Minister for the courtesy and encouragement shown this office throughout the year.

Yours obediently,
R. J. STEWART,
Factories Inspector.

INTERIM REPORT OF INSPECTOR OF DYKES.

OFFICE OF INSPECTOR OF DYKES,
VICTORIA, B.C., August 1st, 1921.

J. E. Griffith, Esq.,
Deputy Minister of Public Works, Victoria, B.C.

SIR,—In accordance with your instructions, herewith is an interim report of the Department of Dykes for that part of the year 1920–21 ending July 31st, 1921. As our year does not close until September 30th, some of the details must be approximated.

Under the provisions of the "Dyking Assessments Adjustment Act, 1905," this Department is made responsible for the control, as to operating, maintaining, and managing, etc., of the dyking-works in the Dyking Districts of Coquitlam, Pitt Meadows No. 1, Pitt Meadows No. 2, Maple Ridge, and Matsqui. This control includes all engineering-work with regard to renewals, maintenance, and improvements, as well as assessing the lands benefited, and collecting upon these assessments so as to reimburse the Government for expenditures with regard to capital charges and also their advances with regard to maintenance.

Subsequent legislation brought the Matsqui Drainage District into being under the Department and named the Inspector of Dykes as Commissioner to the drainage scheme. As this scheme has nothing in common with the dyking districts, I will treat with it separately.

With regard to the control, etc., of the dyking districts, this may properly be treated under two heads—viz., Finance and Works.

(1.) FINANCE.

The total capital charges against these districts were, in 1905, $345,252, and assessments are so arranged that the Government will have been reimbursed $220,252 of this amount by 1945, and the balance, $125,000, on account of Matsqui District, by 1948. These charges form a part of the annual assessments.

The maintenance charges, which are advanced throughout each year by the Government, are apportioned against the lands benefited during that year and are payable on December 31st each year.

However, owing to the financial situation arising supposedly from the last war, provisions were made by Orders in Council permitting two years in arrears to accumulate, so that the above reference does not strictly apply. In this connection it is worthy of note that not all the land-owners took advantage of this allowance, and also that lands which are primarily farm lands should be better able to pay these charges when the prices for farm produce are at the peak. These charges make up the remainder of the annual assessments.

Collections.—Collections from all sources to July 31st, 1921, were $42,341.12, as compared with $32,171.55 for the similar period to July 31st, 1920.

Expenditures on Maintenance Account.—Efforts have been made to reduce the expenditure on this account without reducing the benefit, and in so far as the present organization permits has met with a fair measure of success. A slight reorganization can be effected which will increase the efficiency very considerably, though I have not had time as yet to compute the ratio. This will be dealt with more fully in a summary at the end of this report.

The total expenditures on account of maintenance up to July 31st, 1921, have been $20,177.34, as compared with $31,368.35 for the similar period up to July 31st, 1920, and the following will show how this is made up and its application to each district:—

Expenditures—Strictly Maintenance.

	To July 31st, 1919–20.	To July 31st, 1920–21.
Matsqui	$15,741 77	$ 8,874 04
Maple Ridge	7,840 03	5,737 37
Coquitlam	3,570 95	3,274 09
Pitt Meadows No. 1	2,137 29	930 42
Pitt Meadows No. 2	2,078 31	1,361 42
Totals	$31,368 35	$20,177 34

From the above it will be seen that a saving of $11,191.01 has been effected, which has not in any way interfered with pumping and other services.

A complete audit has been going on in the Department and their report on the finances should be to hand for the Inspector's Report at the end of the Department's year.

(2.) WORKS.

The dyked lands under this Department total some 24,142 acres, excluding the drainage district, which area is protected by nearly 42 miles of dyke.

Seven pumping stations house twelve pumping units which give drainage facilities to this area when the water-level in the rivers makes pumping necessary.

The works, then, of the Department are quite varied in character and concern the defence-line of the dykes, as regards maintenance, protection, etc.; pumping, as regards upkeep and operation; and the lands behind, as regards their condition and the general benefits anticipated when these breastworks were constructed.

During the part of the year to which this report refers, no work except emergency work or work in the best interests of efficiency has been undertaken. Some work was done in all districts before flood-time as precautionary measures, even though available information led to the belief that extreme high water would not be encountered in the Fraser Valley this year.

Such work as was done was only to strengthen weak places, and then only as much as was considered absolutely necessary; so that in every district there is considerable work which should be done just as soon as conditions lend themselves to the interests of economy.

Flood-time Precautions.—Proving conclusively that the pulse to flood-time conditions is prevailing temperature and not previous precipitation, the river rose this year to the highest level since 1903. This was because the high temperature in the Interior brought some of the Rocky Mountain snow-water out before that from the Coast Range had been accommodated.

Not expecting such conditions, but anticipating the worst, an organization was established similar to that in the Miami Conservancy District on the Mississippi River. Meetings were held in the districts and patrolmen who were held high in the confidence of the people interested were named to the Inspector of Dykes, who afterwards put these men on the patrol force. These meetings acted as bracers to the people, restored their confidence, and served to assure them that when danger threatened the necessary thing to do would be done. A double post-card, asking for a statement of the number of sacks one had available and willing to supply at cost, was sent to each land proprietor, and served the same purpose as well as saving the expense of carrying a large number of these in stock. Some 12,000 sacks were on hand, and these, together with wire fencing and cable, were distributed to points of vantage, and a wagon was always loaded with sheet lumber with a team and driver who was to deliver this wherever needed with all possible speed. Railway companies crossing in close proximity to weak places were asked to slow down their trains and did this conscientiously. As soon as the river reached the stage where precautions were necessary the patrolmen who had been previously selected went on duty and kept up a night-and-day patrol on all weak sections until the danger disappeared.

Weak sections may be taken as existing all along the Matsqui defence and in a few special places in each of the others. On the whole, these weak sections are due to poor material and in a few special cases to poor construction. Further mention is made of these conditions under "Seepage." The cost of this organization, patrol, and emergency work was $1,400.98, which was more than justified by results.

Seepage.—Seepage in variable proportions exists generally wherever the weak sections referred to above are found. The amount of seepage varies as the water-level attained in flood-time (head) and as the time of duration of such flood. This latter variable is due to the saturated condition of the foundations, which are set up in sandy loam structures, with the application of moisture and pressure.

Mention has been made of the weak sections existing practically all along the Matsqui defence. This is due to poor material and poor construction. The material is a sandy loam and slough-beds which should have been crossed by close-piling the dyke on either side were crossed without any piling. In addition to this, the material for the "fill" of the dyke was taken from a borrow-pit on the wet side of the dyke. In "cutting" for this material the impermeable top soil was removed and a porous strata was unearthed, and also the head of water increased by an average of 5 feet, which on top of normal flood heights amounts to

considerable pressure: the seepage assumes percolation proportions and cutting action is set up. Therefore it is increasing each year. The accumulation of seepage-water increasing in quantity each year, fills hollows in the land back of the dyke and drowns out vegetation. An aggregate of 130 acres was made valueless on this account this year, and in all fairness this area should not participate in the costs of maintenance until it is allowed to become productive. The remedy lies in filling in the borrow-pit in front of the dyke.

Having regard to interests other than those of the farmers being menaced by the safety or lack of safety of the dykes, the management of the Canadian National Railways and that of the Canadian Pacific Railway were approached.

The engineer who located the Canadian National Railways' main line admitted that he was able to lower his grade an average of 2 feet in crossing the Prairie because of the existence of the dyke, and the management manifested some interest. They signified their willingness to contribute $5,000 towards the work of filling the borrow-pit, and upon being told that this amount was not worth consideration, sent a special engineer from Winnipeg to investigate. His report is not yet available. The Canadian Pacific Railway are situated somewhat differently, their grade being higher, but it is just possible that they might help as a matter of policy, which also applies to the British Columbia Electric Railway Company, Limited.

This problem is a very important one with the Department and it is hoped that something may be done before another flood-time.

As soon as time permits a thorough survey will be made so that an estimate of the cost may be arrived at. Endeavours will be made to further interest the railway companies crossing the Prairie.

The farmers have manifested great interest in this scheme, and some of them, notably Alex. Cruickshank, have been most energetic and most helpful in the solution of this and other troubles.

In addition to this, there is a constant source of danger at and around No. 1 sluice-gate, where the slough cuts the same porous strata. Seepage here was supposed to come down from the natural surface of the ground and through under the dyke under pressure, and the cutting action was alarming. This was carefully observed during the rising stages of the flood, and the writer is satisfied that the water is forced through the layer of porous strata unearthed by the natural cutting of the slough and not from the surface. The remedy here is to trench along outside the dyke through this strata and seal it with clay. This could be done at a small expense, as the distance involved is not great, and it is believed a permanent solution of the trouble could be effected.

With regard to seepage troubles on other fronts, these are known and receive the necessary attention, but owing to the more stable soil content in the embankments no real danger threatens, and it is only a case of prompt action being necessary and careful watching at flood-time.

Brushing.—In every district brush has been allowed to grow on the dykes until now the cost of removing it will be large. There is no question as to the objectionable features of brush-growing on the dykes. It encourages weakness by making additional attractions for rats and tends to loosen the embankment by the growth of their roots, at the same time preventing a thick grass sod from forming. This is very important in sandy loam structures such as is found in the Matsqui Dyke and in some parts of the others.

Only such brushing was done during the year as would allow for better watching weak places during flood-time.

In cases where cut-off ditches, which were intended to relieve the pumps and which ceased to function because of the growth of brush and other obstructions, brushing and cleaning was done in the interests of efficiency. The cost of this work is made up in smaller pumping charges and better service.

With the necessity of doing some 15 miles of brushing on the dykes in the near future, and the comparatively high rate of wages still in force, it would almost be advisable to herd a large flock of goats on each section of dyke with the idea that they destroy the brush. This method has been tried elsewhere with good results, and with proper control should in time dispose of this evil in an economical manner.

Flood-boxes.—Existing flood-boxes or sluice-gates, speaking generally, are in fair condition. The new concrete box which was built last year at Matsqui at a cost of some $13,000 appears to be of good construction. The important question of floor-levels, together with the size of box,

requires further consideration, and in view of this and the exorbitant cost of the work finished, it is considered advisable to defer action on the one which was to have been erected, but which was not finished last year. A thorough examination of this as regards its condition and also the items mentioned above will be made as soon as the water conditions favour.

In addition, the advisability of putting weepers in the dykes at different points to allow seepage and winter water to run off is receiving attention and will be referred to in the yearly report.

River-protection Work.—This is a problem which has been gaining momentum for twenty years and upon which the buck has been passed from one year to another. It would appear that the Fraser River, being a navigable waterway, should be upon the same footing as the St. Lawrence in Eastern Canada; however, the fact remains that its southern bank is gradually encroaching and in a very short time will be under the Matsqui Dyke in some places.

Some training-works were erected, and erected wrongly, in 1908, in which the Department of Public Works, Canada, shared half the cost. These did not do the work intended, but are now so near gone that they are no longer an aid to the natural agencies of destruction.

Some 300 lineal feet of protection-work is needed at once at Matsqui. The eroded bank should be graded to a natural slope and pitched with a brush mattress and one-man rock.

On the Pitt River, west side, some 500 feet of protection-work is also needed at once. Owing to the different material there the brush mattress is not necessary, but about 200 tons of one-man rock would act as a temporary protection. Here piling, close boarded at the bottom and as far away from the dyke berm as possible, would be the remedy.

On the Pitt River, east side, some 700 feet is needed at once. Here some old piles can be utilized with a few additional ones, but close boarding should be done next low water.

Pumping.—The pumping season opened about two weeks earlier this season than last, and owing to the heavy precipitation in the spring months considerably more water had to be pumped. Although the season is not yet finished, there is reason to believe that the farmers are satisfied with the pumping service so far, which is gratifying, since every effort was made to render adequate service.

During the last week in June one of the old wooden pumps at Maple Ridge failed with age. Contracts had been let for supplementing this pump and its mate, and this will be in hand before another season. Meantime the pumping in this district is being done by the old wooden pump, which is still holding, and the Gwynn pump. Luckily the dry weather conditions have made it possible for these two pumps to handle the situation.

At Matsqui No. 2 Station the new unit which was installed last year was out of commission during flood-time because of violent vibrations set up in the discharge-pipe endangering the dyke, and the pump was stopped. Later when it was started, and after 50 minutes' operation, its pulley-wheel failed, flying to small pieces and greatly damaging the belt. However, by working continuously the old unit in this station was able to handle the water and is still continuing to do so.

The Vancouver Machinery Depot, who supplied this unit along with another at No. 1 Station, were approached with the idea of fixing their responsibility in the matter, and though they had finished their contract, and there was nothing concerning a guarantee in their contract, they have undertaken to make good the damage on a moral issue, and it is possible that this accident may be cleared up without expense to the district.

Maple Ridge—New Pumps.—The two wooden pumps which had operated in Maple Ridge District since 1896 had shown signs of decay for some years and had been patched to the limit. How long they would last was an unanswerable question, but one of them failed this year. It was previously decided to replace these with centrifugal pumps.

Tenders were called for the supply of these in March of this year. These were cancelled and new ones called for, in which more up-to-date equipment was specified and the installation and erection of same, together with pipe-lines, included. Foundations and pump-house were kept separate and will be completed by the Department by day-work.

Fourteen bids were opened, and after consultation with John Peck, Inspector of Machinery, and J. Muirhead, Inspector of Electrical Eenergy, that of Robt. Hamilton & Co., of Vancouver, was accepted.

A battery of two units, each with a capacity of 24,000 imperial gallons per minute and an efficiency of 73 per cent. helical cut-steel gear drive, automatic discharge-valves, suction and

discharge piping, all erected and fully guaranteed for one year, is the essence of the contract into which that company entered with the Department. Their price, which was the lowest tendered, was $17,047 and had the advantage over any other of being wholly disbursed within Canada.

A start has been made by the Department on the foundation-work and this is now ready for the superstructure.

The estimated cost of this battery complete is $20,500, and I am unable to estimate the salvage value of the old equipment. It is in accordance with the best engineering practice and will permit of automatic control, which phase is given further attention later in this report.

Operation.—Under date April 1st, 1919, a contract was entered into with the Western Power Company of Canada, now the British Columbia Electric Railway Company, Limited, which runs for five years. By it $0.004 per kilowatt-hour is paid for energy used during the months of May, June, July, and August, and a demand charge in addition of $958.33 plus $1.25 for each kilowatt over 700 kilowatts for each of those months. For the other months of the year a demand charge of $100 per month is to be paid, and if energy in excess of 500 kilowatts is used during that time the rate of $0.01 per kilowatt-hour shall apply.

Each station is insured against straight fire loss by policies which have been in force for some time. This form of policy would not appear very useful as it is not comprehensive enough. The straight fire risk is small in any case, so inquiries have been made with regard to obtaining a sort of marine insurance on the plants or a combination of the two. Information on this is not yet to hand.

The possibilities of reducing the pumping costs are being gone into thoroughly and there is a possible solution.

The seven stations with present equipment require the constant services of one operator each and occasionally two operators. Automatic electric controls would do away with these operators and would require an initial outlay of some $1,800 per station equipped. The suggestion is worth the fullest investigation and is receiving the same.

Drainage.—Every district is suffering from lack of drainage facilities. Ever since the dykes were built natural agencies have been going on raising the bottom of the natural waterways to the level of their obstructions at the dyke crossings, conditions having been gradually becoming worse, until now there is a crying need in every district. Steps have been taken this year to attend to this problem now and to cope with it as it recurs, and it is hoped that in the next few years the natural watercourses will all have been cleaned, thereby allowing the land-owners an outlet for their private drains.

It is intended to keep the equipment purchased this year for completing the Matsqui drainage scheme within the Department, to be used for the benefit of all lands under the Department. With this equipment work of this nature can be done at the lowest possible cost, but it would appear advisable to distribute the cost of such work over a six-year period, giving the productive qualities of the soil a chance to recover before the land has to bear the full limit of the cost.

It is estimated that the lapse of time between the recurring of choked conditions will be six years between the first and second operations and from eight to ten years thereafter, so that the work can be done and the cost distributed without overburdening the property.

In arriving at the order in which work should be undertaken as regards districts, consideration should be taken of the condition of the lands and also as to whether the occupiers of the lands are making a business of farming or merely holding for speculation.

The Soil and Crop Division of the Department of Agriculture have made surveys of the areas concerned, and their report leads to the belief that great things may be expected of these areas after adequate drainage facilities shall have been provided.

Mention has been made elsewhere in this report of the financial conditions and the necessity of altering the operation of the Act with regard to collections by Order in Council, allowing two years' arrears in assessments to accumulate, because of conditions attendant upon the last war. My information is, however, that this action was necessary because of the soil conditions attendant upon lack of drainage, which would seem to be borne out by a record of prices received for farm produce during and since the war period. Sooner or later the accumulated arrears (two years in several cases) will have to be collected, and it would be well to give the farmers what encouragement is possible, so that they would drain their lands and make them 100 per cent. productive.

In some of the districts, notably Maple Ridge, there are considerable areas of bog lands, most of which have reverted to the Province for unpaid assessments. Some method may be found for making these areas productive, but meantime they are a charge on the Province with little hopes of being redeemed.

MATSQUI DRAINAGE.

The Matsqui Drainage District No. 1 was brought into being by petition of the majority in value of the land-owners in 1919, under the "Drainage, Dyking, and Development Act, 1918." It was financed under section 58, chapter 25, "Dyking Assessments Adjustment Act, 1905." The requirements of that Act were complied with, and the Inspector of Dykes, being named as Commissioner, named C. E. Cartwright as engineer to the district, and he laid out the scheme in consultation with the Inspector of Dykes.

The original estimates fixed the cost of the work at $35,000, and $4,000 for preliminary surveys, expenses, etc.

The contract was let to the Northern Construction Company on a cost-plus basis, which company were made to close down their work for various reasons late in 1920.

On taking over the Department in February, 1921, I found the work about 70 per cent. completed, at a cost of some $90,024.72, with contracts let estimated to cost $1,693.71. The work of finishing estimated at 30 per cent. of the whole, consisted of some 3⅛ miles of lateral ditches, some 4½ miles of main slough to be excavated, some clearing-up of work left by the contractors, and a log-jam in the slough at Gifford to be removed.

Estimates showed that the laterals could be finished for $7,000 by hand-work, and this work was let to local contractors. While not yet finished, the results are satisfactory, the finished work being of good character and the cost well within the estimate, though necessarily high because of the method.

The slough-work could not be done by hand, and as the Department had no equipment at that time for doing the work an effort was made to have this work done by contractors who had proper equipment. The most attractive proposition was one which estimated the cost at some $17,000 on a cost-plus basis, doing the work with a scow-dredge. In addition to this estimate, there were such extras as brushing, removing and replacing bridges, water-pipe lines, etc., which, with the possibilities centred around the cost-plus system and also the similar problems in other districts, led to the purchase of an up-to-date excavating-machine by the Department for use in finishing this project and later in other districts.

This work is being done by the Department by day-work with the machine mentioned and is giving good results. Excluding rental, $3,832.20 has been spent in this connection and about 2½ miles of the slough-work completed. Each month shows an increase in efficiency, due to the better working of a slightly worn machine and also to the fact that the principle is gradually being established that "Government work should not cost more."

It is expected that the method adopted will beat the price estimated for the scow method by around 50 per cent.

In connection with the Matsqui drainage scheme, a few points might be mentioned which will be helpful in future work without trespassing on its history.

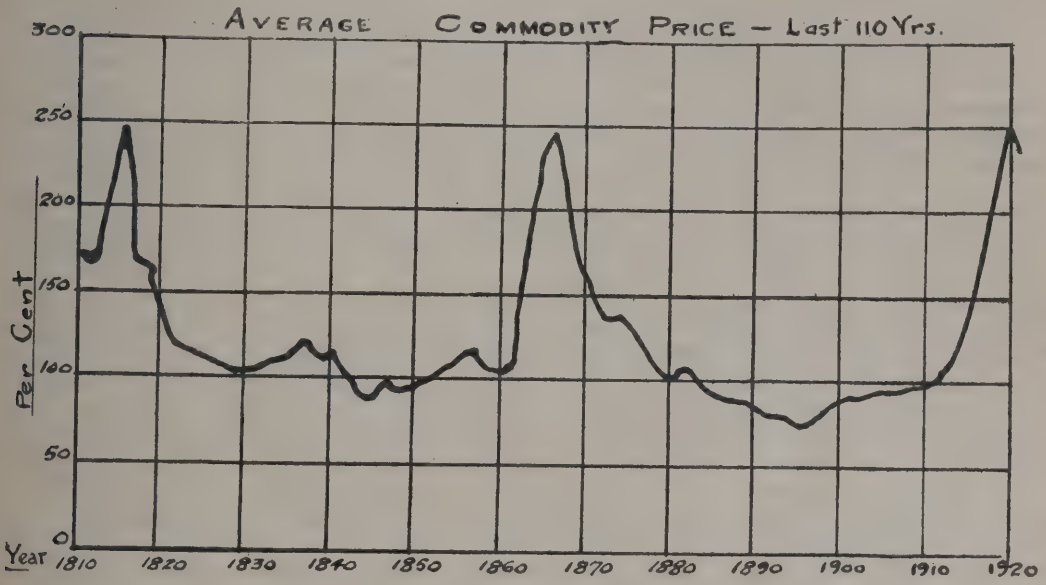
The comprehensive scheme which was adopted was wrong in two main particulars: (1.) A boundary was adopted which was not in any way a natural boundary—viz., the Halert Road. All that property south of this land-line was made a part of the district, participating in the benefits and costs. All that property north of this line was outside the district and did not participate in the cost; while that property immediately adjoining would necessarily participate in the benefits. (2.) The slough-work, which because of the very nature of things is a part of the dyking-works, should have been done at the expense of the whole prairie and not that portion of it south of the Halert Road.

Arrangements are made for assessing the lands within the district on a basis of 100, 50, and 25 per cent. benefit, the yearly assessments plus 5 per cent. for maintenance reimbursing the Government for capital advanced in full by the year 1948.

Provision was made by the Act for the holding of one Court of Revision to determine and fix the benefits; and, further, that if one was not satisfied with the treatment accorded, appeal could be made to a County Court Judge.

Pleading ignorance, a great many have appealed to the Department for justice in the matter of their classifications. In some cases the classifications are decidedly unfair, and I trust that these injustices may be rectified as soon as the work is completed, and suggest that another and final Court of Revision be held.

WORKS, GENERAL.



The above graph is compiled by American banking interests from authentic records and is adopted generally as being reliable. The downward curve from the Great War prices is expected to approach that of the previous two in similarity, though some authorities claim that owing to the far greater amounts of capital involved the decline will be slower. However, it will serve to point out that in the interests of economy considerable may be gained by deferred action

Applied to this Department, however, while it is well to have that picture always in mind, the fact remains that there is much work which has been allowed to slide too long and must (parts of it at least) be attended to at once or the interests of economy will have been defeated. A patch programme is needed which will eventually lead to first-class conditions, and this can only be effected at this time by exercising careful expenditure and constant supervision, otherwise the dyked lands will be hopelessly overburdened.

SUMMARY.

The more salient features of the Department may be set out as follows:—

With regard to finance:—

(1.) The assessed rate per acre has increased from an average of $1.34+ in 1908 to $2.57+ in 1920.

(2.) Two years' arrears—i.e., 1919 and 1920—have accumulated on considerable of the holdings in the different districts and sooner or later must be collected.

(3.) Owing to prices for farm produce having already declined materially, collections would be expected to be harder unless production is increased or expenditures lowered, or both.

(4.) At last year's tax sale fifty-four parcels were exposed and only one bid made at the upset price.

With regard to works:—

(1.) Certain work is necessary even under present unfavourable conditions, such as drainage to increase production and some protection-work and some maintenance-work to safeguard present investments.

(2.) A far-sighted business programme, carefully planned and painstakingly executed, must be adopted to save this Department from embarrassment and to put the dyked lands upon a solid footing.

These features, while alarming, can be satisfactorily overcome, in the writer's opinion, only by the application of scientific management in its strictest sense, both as regards finance and works; and it is intended in this summary to deal with the remedy on the merits of efficiency as supplied by scientific management.

It is extremely difficult for one already within an organization, if only for a few months, to do justice to a question of this kind, on account of personal sympathies, and more particularly in the case of the writer, whose treatment at the hands of those who have been long in this organization, some over twenty years, has left nothing to be desired. Their loyalty and painstaking work causes deep regret and no relish for the work in hand. For this reason efficiency engineers, who are the most highly paid among technical men of to-day, are injected into organizations rather than promoted. Regardless of the personal cost, the duty is clear.

In dealing with any question on a basis of efficiency, immediate conditions must be studied and standards set which will approach the conditions desired. In addition, future requirements must be ascertained and sometimes imagined.

In the question under discussion present conditions are known, but future requirements will have to be imagined as applied to the scope of the Department. Past performances should be forgotten and future performances under scientific management anticipated.

Logically, all dyked lands in the Fraser watershed could best be administered under one head, for the reason that overhead charges would be less because of the distribution made possible. Further, up-to-date equipment could be maintained for the benefit of all dyked lands at a minimum of cost.

An efficient organization would therefore anticipate administering to more dyking districts than are at present under the Department, and this could be set up as well within the range of future requirements.

To best serve present and future requirements, the following is submitted in the interests of efficiency:—

(1.) The Department should be located at New Westminster as early as possible.

(2.) Clerks of municipalities whose interests conflict with a dyking district should be made responsible to the Inspector of Dykes and work with him and collect the dyking assessments for that district.

Enlarging upon these suggestions, it is pointed out: (1) That by moving to New Westminster a direct saving in the time of the Inspector of Dykes is immediately effected, by way of the 66 per cent. reduction in distance to be travelled; (2) the time which is so essential to the carrying-out of contemplated works in an efficient manner could be found; (3) expenses of the Inspector of Dykes would be reduced about 50 per cent.

With regard to the clerks of affected municipalities working with the Inspector of Dykes, it is pointed out that there is at present a certain duplication of office-work, such as searching titles, mailing notices, and book-keeping, and that the additional work to the municipal clerks would therefor not be great. An extra column in their books for dyking charges would enable them to handle collections efficiently, and a copy of so much of the assessment roll for any year as applies to their district would enable them to do such book-keeping as is necessary. Returns made to the Inspector, say, once each week on a system to be devised would enable the Inspector to keep a close check upon their work and the departmental books to be kept in good condition with a minimum staff.

It is anticipated that a staff of one, who should be proficient in both book-keeping and stenography, would handle all the work at the head office.

The advantages of this method would be:—

(1.) Reduction in overhead charges.

(2.) It permits of better collections (important because of accumulated arrears).

(3.) It localizes a part of the organization and will stimulate interest and lead to better satisfaction.

(4.) It will give the Inspector of Dykes more time and allow him to keep in closer touch with both finance and works.

(5.) It anticipates future requirements and would permit the addition of other districts into the Department without any increase in overhead.

These suggestions are made after careful thought, and, in the opinion of the writer, form the basis of a reorganization along the lines of scientific management.

It is regretted that sufficient time has not yet been available for a careful study of the working-out of details, but these can and will be met.

Consideration has always been given to the axiom that "It is easier to tear down than to build up." It is qualified by the fact that conditions are not even similar to those of twenty years ago, or even five years ago.

Yours obediently,

BRUCE DIXON,

Inspector of Dykes.

FIFTIETH ANNUAL REPORT

OF

THE PUBLIC SCHOOLS

OF THE PROVINCE OF

BRITISH COLUMBIA

1920-21

BY THE SUPERINTENDENT OF EDUCATION

WITH APPENDICES

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty.
1921.

To the Honourable WALTER CAMERON NICHOL,

Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

I beg herewith respectfully to present the Fiftieth Annual Report on the Public Schools of the Province.

J. D. MACLEAN,

Minister of Education.

November, 1921.

TABLE OF CONTENTS.

Part I.

	Page.
Total Enrolment in High and Public Schools	9
Number of Divisions, Enrolment, etc., in each of the High Schools	10
Number of Divisions, Enrolment, etc., in each of the City Elementary Schools	11
Number of Schools, Enrolment, etc., in each of the Rural Municipalities	13
Total Enrolment in the Rural and Assisted Schools	13
Expenditure for Education	13
Cost to Provincial Government of each Pupil on Enrolment and on Average Daily Attendance during the Past Ten Years	15
Number of School Districts, Aggregate Enrolment, etc.	15
Number of Teachers employed in the Various Electoral Districts	16
Inspectors' Reports—	
High Schools	17
Public Schools	20
Municipal Inspectors' Reports—	
Vancouver	39
Reports on Normal Schools—	
Vancouver	44
Victoria	45
Report of the Organizer of Technical Education	47
Report of the Director of Elementary Agricultural Education	51
Summer School for Teachers	62
Report of the Officer in Charge of the Free Text-book Branch	66
The Strathcona Trust	68

Part II.

Statistical Returns—	
High Schools	2
City Elementary Schools	14
Rural Municipality Elementary Schools	52
Rural and Assisted Elementary Schools	72
Names of Schools, Number of Teachers, etc., in each of the Electoral Districts	94

Part III.

Names of Persons to whom Teachers' Certificates were issued	99
High School Examination—	
Names of the Winners of Medals and Scholarships	104
Number of Successful Candidates at each Centre	105
High School Entrance Examination—	
Names of Medal-winners	106
Number of Successful Candidates at each Centre	107
High School Entrance Examination Papers	113
High School Examination Papers—	
Third-class Certificate (Non-professional)	122
Third-year Course, Commercial	134
Third-year Course, Household Science	150
Third-year Course, Technical	154

University Matriculation (Senior)	177

PART I.

GENERAL REPORT.

REPORT OF THE SUPERINTENDENT OF EDUCATION, 1920-1921.

EDUCATION OFFICE,
VICTORIA, B.C., November, 1921.

To the Honourable J. D. MacLean, M.D., C.M.,
Minister of Education.

SIR,—I beg to submit herewith the Fiftieth Annual Report of the Public Schools of British Columbia for the school-year ended June 30th, 1921.

I have the honour to be,
Sir,
Your obedient servant,

S. J. WILLIS,
Superintendent of Education.

ENROLMENT.

The total enrolment in all the schools was 85,950. The number of boys was 43,442, and of girls 42,508. The average actual daily attendance was 68,497. The percentage of regular attendance was 79.69.

NUMBER OF TEACHERS EMPLOYED.

The total number of teachers employed, including manual-training and domestic-science instructors, was 2,734. Of this number, 251 were employed in the high schools, 1,077 in the city graded schools, 644 in the rural municipality schools, and 762 in the rural and assisted schools. Thirty-five high and 105 public schools were in operation in the cities; 15 high and 182 public schools in the rural municipalities; and 2 high and 607 public schools in the rural and assisted districts.

NEW SCHOOLS.

The following is a list of new schools that were established during the year:—

Cariboo District .....Miocene; 150-Mile House.
Columbia District .....Parson.
Comox District .....Lang Bay; Nimpkish River; Okeover Arm; Stillwater; Suquash.
Cowichan District .....Mayo.
Dewdney District .....McConnell Creek.
Esquimalt District .....Shirley.
Fort George District .....Aleza Lake; Hulatt; Orange Valley; Penny; Swan Lake; Tate Creek; Taylor's Flats.
Grand Forks District .....Spencer.
Greenwood District .....Norwegian Creek.
(The) Islands .....Divide; Thetis Island.
Kamloops District .....Adelphi; Barriere Valley; Floral Creek; Lackenby; McLure; Wire Cache.
Kaslo District .....Gray Creek.
Lillooet District .....Blue Ridge; Forest Grove; 70-Mile House.
North Okanagan District ..Trinity Valley.
North Vancouver District ..Brackendale; Irvine's Landing; Wilson Creek.
Omineca District .....Decker Lake; Driftwood; Glentanna; Lake Evelyn; Tchesinkut Lake; Topley; Wistaria.
Prince Rupert District ....Buckley Bay; Firvale; Hanall; Lawn Hill; Queen Charlotte.
Similkameen District .....Allenby.
Slocan District .....Bellevue; Carroll's Landing; Passmore; Three Forks.
South Okanagan District ..Bear Creek.
Trail District .....Birchbank; Champion Creek.
Yale District .....Gladwin.

HIGH SCHOOLS.

The enrolment in the high schools during the year was 7,259. Of this number, 3,093 were boys and 4,166 were girls.

The number of divisions, the total enrolment, the average actual daily attendance, and the percentage of regular attendance in each high school are shown in the following table:—

High Schools.	Number of Divisions.	Total Enrolment.	Average Actual Daily Attendance.	Percentage of Regular Attendance.
Agassiz	1	25	23.12	92.48
Armstrong	2	41	36.34	88.63

INSPECTORS' REPORTS.

HIGH SCHOOLS—INSPECTORATE No. 1.

VICTORIA, B.C., September 17th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the following report on the high schools of my inspectorate for the school-year ending June 30th, 1921:—

This inspectorate contains the same schools which I enumerated in my last annual report, and in addition the high school at Bridgeport, in Richmond Municipality, which was assigned to my inspectorate at the beginning of the school-year, and the Prince of Wales High School, which was opened last September in the Municipality of Point Grey. The Bridgeport High School has a staff of three teachers and the Prince of Wales High School a staff of four. Increases in the staffs of other schools were as follows: Kamloops, one teacher; Queen Mary High School, North Vancouver, two; and in the high schools of Vancouver City that came under my supervision, four teachers, apportioned thus: Cecil Rhodes High School of Commerce, one teacher; King George High School, one teacher; and the Kitsilano High School, two teachers. The total number of teachers in this inspectorate, including those in the high schools at Prince George, Prince Rupert, and Quesnel, that were reported upon by the resident Public School Inspectors is 130.

Nine of the total number of teachers held commercial specialist certificates and two gave instruction in physical training only. The remaining 119 teachers taught purely academic subjects and all but three had university degrees. Twenty-four were graduates of universities in the British Isles, fifteen having graduated from universities in England, seven from those in Scotland, and two from those in Ireland. The remainder were graduates of the following Canadian universities:—

Acadia University	12	graduates.
Dalhousie University	11	„
Manitoba University	8	„
Mount Allison University	1	„
McGill University	18	„
McMaster University	2	„
Queen's University	10	„
Toronto University	19	„
University of British Columbia	6	„
University of New Brunswick	5	„

Only twenty teachers had not received professional training. In view of the fact that up to two years ago a graduate in Arts, in Science, or in Literature of a recognized university within the British Empire could obtain an academic certificate by passing a written examination on the art of teaching and the school law of the Province, the percentage of teachers who have not received any professional training is remarkably small. Now that graduates of recognized British universities must hold certificates of approved Normal Schools, it will not be long before every teacher who holds an academic certificate will also have training in the art of teaching.

This year, for the first time in my experience, I inspected the work of teachers who received all their education in the public, high, and normal schools of the Province, and who graduated in Arts from the University of British Columbia. Their intimate knowledge of the subject-matter of the lessons taught, as well as the methods used in the presentation of lessons, reflected credit not only upon the teachers themselves, but upon the educational system of which they are the finished product. I examined both the academic and professional side of the work of these teachers with profound interest, because our "schools of to-morrow" will be taught largely by those who receive their elementary education in our public schools and who graduate from our high schools, our Provincial University, and our Normal Schools.

In erecting new buildings and making provision for additional accommodation many School Boards have been slow to act, chiefly on account of stringent financial conditions. In contrast to a number of cities that have systematically voted down by-laws for school purposes, the

Cities of Kamloops and Nanaimo may be mentioned for having carried their money by-laws by substantial majorities. The Nanaimo School Board has purchased the Agricultural Exhibition Hall, which will be converted into a high school. This building is commodious, the site is an excellent one, and the grounds are spacious. There are ten high schools in this inspectorate occupying buildings in common with public-school classes. While this grouping of public- and high-school pupils in one building is not conducive to the best results, yet I have found the principals and teachers of both schools endeavouring to synchronize the times of opening, intermission, and closing, so that instruction in one school will be interfered with as little as possible by the entrance and exit of pupils in the other. Owing to the large increase in attendance at Bridgeport, Cloverdale, Kamloops, and in Point Grey Municipality, it will be only a short time until the buildings now used conjointly at these centres will be occupied solely by high-school pupils.

Teachers are manifesting a greater interest than heretofore in the organization of school libraries, in the selection of books adapted for the use of their pupils, and in directing their reading so that they will become acquainted with standard authors and thereby cultivate an appreciation of the best literature. I have observed, too, that teachers who install libraries in their schools are themselves lovers of good books and keep abreast of the times in their professional reading.

"The Province of Ontario," according to a statement made by its Minister of Education, "has in proportion to population a greater number of public libraries than any country, State, or Province in the world." In addition to its public and travelling libraries, the library of the Department of Education at Toronto offers to every teacher in the Province, no matter how isolated his school, the best educational works procurable. It contains upwards of 36,000 books and 130 American, British, and Canadian monthly educational journals. These books and periodicals refer to subjects taught in the public, high, and normal schools. The library also has collections of pamphlets, reports, and bulletins on the history and development of education, as well as samples of standardized tests for determining progress in various school subjects and scales for the measurement of intelligence. It has books on science, history, art, agriculture, psychology, the social sciences, and vocational, industrial, and technical education. This library is at the service of teachers, inspectors, students reading for degrees in pedagogy, and persons doing research-work in educational problems. The books are loaned for a period of two weeks and the time may be extended further if there is no other call for the book. The only cost to the borrower is the postage required to mail the book or periodical back to the library.

The Department of Education in this Province has been wisely helpful in the financial assistance it has given to public- and high-school libraries; for scholarships to British Columbia students for post-graduate study in France; towards Frontier College, Hands Across the Seas movement; and in supplementing amounts expended by Boards of Trustees for high-school laboratories. I can think of no investment, however, that would yield greater returns than the establishment of a library somewhat similar to that in the Ontario Department of Education. Such a library should be a centre from which would radiate new life and inspiration to every school in British Columbia.

I have, etc.,

ALBERT SULLIVAN,

Inspector of High Schools.

HIGH SCHOOLS—INSPECTORATE No. 2.

Vancouver, B.C., July 30th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

Sir,—I beg leave to submit the following report on the high and superior schools of my inspectorate for the school-year ending June 30th, 1921:—

This district now comprises twenty-five high schools (with 123 divisions) and nine superior schools. Including a number of specialists, who did not enroll classes, 153 teachers were employed in these schools, fourteen more than last year. I was able to make 257 visits of inspection, having called at all schools at least twice, with the exception of the South Vancouver School, two large Vancouver schools, and one outlying superior school. These schools were inspected only once.

During the year new superior schools were established at Ioco and Nakusp, while a high school was opened at Slocan City and a technical school at New Westminster. The Port Moody Superior School was closed and the high-school pupils of that city were conveyed by automobile to the New Westminster High School.

Technical work made noteworthy strides during the year. Since the inauguration of technical high-school work in Vancouver the classes had been conducted in the King Edward High School. During the year the Provincial Government purchased the Labour Temple and is now leasing it to the Vancouver School Board for use as a technical school. This building is a very admirable one for the purpose. The move from King Edward School was made on March 1st and the Vancouver Technical School was formally opened by the Honourable the Minister of Education on the afternoon of April 4th.

The Provincial Government presented the City of New Westminster with the building formerly used as a gaol. The School Board of that city converted this into a very satisfactory school, remodelling the interior of the building and installing an excellent heating system; thus came into existence the T. J. Trapp Technical School.

The Municipality of South Vancouver is to be congratulated on its excellent new high school built during the year. This building, which was named after the Premier of the Province, contains twelve class-rooms, a large auditorium, and a number of smaller rooms. Classes started work here on January 17th and taxed the capacity of the building to the limit. More class-room accommodation will be imperative at the opening of school next year.

In some of the schools, more especially in the larger graded schools at the Coast, the work of the classes shows improvement from year to year, but I am sorry to report that in many of the smaller schools the standing of the classes is considerably below that of previous years. There is much good teaching in many of these schools, but because of lax grading at the end of the first or second year pupils come up to the higher classes who are unable to cope with the difficulties which arise in the different subjects from day to day. These not only fail to grasp the work themselves, but act as a drag on the whole class, and consequently the well-prepared pupils suffer also. I am firmly convinced that if a high standard of high-school work is to be reached and maintained in future, it will be necessary for teachers at least in the smaller schools of the Province to ask their first- and second-year pupils to write the Departmental Examination. I am informed that it is the intention of the Department to prepare papers for Preliminary and Advanced Junior pupils. While principals will still have the privilege of grading these classes if they so desire, I believe it will be the part of wisdom for them to require their pupils to submit themselves to the Departmental test.

I have, etc.,
J. B. DeLong,
Inspector of High Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 1.

VICTORIA, B.C., September 2nd, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the following report on the public schools of Inspectorate No. 1 for the school-year ended June 30th, 1921:—

The year just closed showed a slow though steady growth in the number of children of school age within the inspectorate, and with few exceptions the accommodation already provided was ample. At Courtenay an eight-room frame building was erected and one division added to the school; at Cumberland a four-room addition was erected and the staff increased by one more teacher; McGuigan School was reopened; a third division was formed at Union Bay, the old school-house being utilized to accommodate it.

With few exceptions, the districts in this inspectorate are well provided with excellent school buildings and the children, as a rule, have no long distances to walk to school. From the Tsolum allotments of the Merville Settlement the children were carried to school first by motor-car and afterwards by team, but neither method was satisfactory, as the children were compelled to walk too great a distance over mud roads to the conveyance. The settlers on the Dove Creek allotments were empowered to reopen the Nikrap School in their vicinity, but this was not attempted during the year. Until the roads in this new area are completed and rendered passable at all times of the year, it will be impossible to formulate any permanent plan for the schooling of the children affected.

In passing around the various school districts I have found quite a demand for men as principals of small graded schools—a demand that is impossible to satisfy because so few young men view the calling of the teacher with any degree of favour. While complaint is heard of unemployment and overcrowding of other callings, the schools continue undermanned, but I believe many a recruit would be obtained if teachers would direct the attention of pupils and students to the need for male teachers in our public schools.

Principals of schools advancing 60 per cent. of Entrance pupils to high school without examination have not yet in all cases absorbed the spirit of the instruction governing this matter. Whereas in the years before this plan of promotion was adopted a principal would invariably purge the class of all certain failures before the day of examination, at present no such elimination of certain failures appears to be undertaken before the 60 per cent. is struck, and it is quite within the range of possibility that the 60 per cent. thus advanced upon recommendation contains a greater number of scholars than would have been presented for examination under conditions previously existing.

I found the class-work usually of a satisfactory character. A noted improvement within recent years is the greater care displayed by teachers in placing work upon blackboards, and a greater desire on their part to render the class-room more attractive through a more general use of wall pictures and window plants.

I have, etc.,
W. H. M. MAY,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 2.

VICTORIA, B.C., August 31st, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—Herewith I beg to submit a general report on the condition of the public schools in Inspectorate No. 2 for the school-year ending June 30th, 1921.

This inspectorial division comprises roughly the islands in the Gulf from Saturna to Gabriola; the Municipalities of Oak Bay and Esquimalt; the west coast of Vancouver Island from Port Renfrew to Port Alice on Quatsino Sound; the territory from Highland to Jordan River, and all that country extending north from Victoria along the Esquimalt & Nanaimo Railway to Qualicum Beach, including the Cities of Duncan, Ladysmith, and Nanaimo.

In the unorganized portion of this territory there are fifty-nine ungraded schools; twelve graded schools of two divisions each, four of three divisions, one of four divisions, and one of nine, making forty-nine graded divisions in all. There are, therefore, 108 teachers engaged in the unorganized portion of this inspectorate as at present constituted.

In the two suburban municipalities of Oak Bay and Esquimalt there are twenty-eight divisions with twenty-nine teachers; in the former two schools with seven teachers in each, and in the latter one large school with fifteen teachers. In the consolidated school at Duncan, to which are drawn by motor-vans every school-day the children in the North Cowichan Municipality, with the exception of those at Chemainus, Crofton, and Genoa Bay, there are ten divisions, with facilities for the teaching of domestic science and manual training for all pupils in the Intermediate and Senior Grades of the elementary schools. The School Board also made provision for the teaching of these subjects to the pupils attending the graded school at Chemainus. Mention is made here of the facilities provided for the teaching of these subjects for the reason that outside of where consolidation has taken place there are very few rural children who enjoy these advantages.

In the elementary schools of Ladysmith and Nanaimo there are thirty-seven divisions in operation, eleven in the former and twenty-six in the latter, making a total in the whole territory of 184 teachers.

With the exception of two schools on the west coast of Vancouver Island, neither of which presents any difficulty in visiting, but very difficult to get away from inside of the loss of ten days, I inspected and examined all the others once, a large proportion of them twice, and a number three times.

During the school-year ending June 30th an assisted school was established and opened on Thetis Island opposite Chemainus; also one at Mayo, on the Canadian Pacific Railway branch line from Duncan to Cowichan Lake, about 9 miles from Duncan; an additional room was added to the school at Errington and occupied in the month of October; while at Langford provision for additional accommodation was made before the close of the school-year, and a second division will be in operation there when the schools reopen in September. Early in September, 1920, the crowded condition of the consolidated school at Harewood necessitated the opening of another division, and a small cottage located on 2½ acres recently purchased by the School Board was fitted up as a temporary class-room and opened early in October. The teaching staff both at Duncan and Nanaimo was added to at the commencement of the present calendar year to meet the increased enrolment.

At this particular stage permit me to be reminiscent for a paragraph. It is now sixteen years since I inspected and examined the schools in this territory. In the rural portions the school buildings of that day are gone. The small rural schools with one teacher, such as North Cedar, Chase River, Harewood, Extension, and Parksville, are now replaced by modern buildings of from two to nine divisions; while in places like Cassidy, Diamond Crossing, Brechin, and Errington, with two and three divisions, there were no settlements at all. On the islands in the Gulf, from Saturna to Gabriola, the number of schools has been increased, but in a number of instances the cause of education would have been much better served had there been schools of two or more divisions established instead of multiplying the number of one-roomed schools. While there is noticeable a decided improvement in the character of the buildings, equipment, apparatus, and general facilities for carrying on the work of instruction, much still remains to be done in improving and beautifying the grounds. Much, however, has been accomplished along all these lines. The children of to-day, generally speaking, are comfortably housed and very happy in their surroundings and in their school-work. There is little or no coercion. The relations between teacher and pupils are amicable, cordial, and natural. Nearly all schools are the happiest of homes.

The increasing number of teachers without experience and the lack of continuity of tenure in our rural schools have been deplored in many annual reports. The recent graduates of our Normal Schools must get their experience somewhere and in some schools, and until School Boards in all instances pay a sufficiently attractive salary our young teachers must in self-defence continue, after the manner of their detractors and defamers, to sell their product in the best available market.

The great factor in our public-school education after all is the man or woman behind the teacher's desk. The personality of the teacher is the great national asset, next to which come

in importance the interest, sympathy, and co-operation of the community. Considering the apathy and indifference of many of the communities, the educational progress of the children, whose sole inspiration is the young lady teacher, with an occasional stimulus contributed by a sympathetic mother here and there, is nothing less than marvellous.

Let me conclude my report with an extract from a recent magazine article:—

"Education used to be regarded as a philanthropy. Charitable schools cast their turbid shadow on mid-Victorian literature. It was a form of charity which was withheld as far as possible from the working-classes, lest it make them restless and dissatisfied, and was given out only in quantities which were expected to add to the usefulness but not to the ambition of the lower ranks of society. Democracy has discredited education as a philanthropy and recognized it as the right of every potential citizen, the only insurance against the anarchy of ignorance, and the sole safeguard of the institutions of a free people.

"The public schools offer to all the children of Canada the opportunity to prepare for citizenship together—the rich and the poor, those with long traditions of culture and those with long traditions of toil—in the atmosphere and under the inspiration of the community institution. No money can return larger dividends in real accomplishment than that added to the budget of our public schools; nor can any community interest more certainly strengthen the best elements in our civilization than that devoted to the improvement of the public education."

There is a moral responsibility laid upon every citizen not only to work for the betterment, but to contribute his quota of money and service to the strengthening and improvement of every community institution devoted to the public service. The day of exclusivism is past and that of public service and co-operation, let us hope, has succeeded.

In concluding a review of last year's work, perhaps the most agreeable in my experience, permit me to express my appreciation of the unfailing courtesy and kindness extended to me by all with whom it was my privilege to transact business connected with educational work in this inspectorate.

I have, etc.,
A. C. STEWART,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 3.

VANCOUVER, B.C., September 2nd, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the following report on the schools of Inspectorate No. 3 for the school-year ended June 30th, 1921:—

Inspectorate No. 3 comprised eleven Coast schools, extending from Gibson Landing to Pender Harbour, the public schools of the Rural Municipality of Richmond, and the following public schools in Vancouver City: Aberdeen, Beaconfield, Bayview, Children's Home (Grenfell), Dawson, Charles Dickens, Hastings, Kitsilano, Mount Pleasant, Macdonald, and Strathcona.

This inspectorate comprised 173 class-rooms at the beginning of the school-year, but before the end of February ten additional classes were organized in the city schools mentioned above. One visit of inspection was made to each of the 183 class-rooms involved, and as far as time permitted a second visit was made to rural schools. Some rural districts were visited the third and fourth time in connection with special business.

One outstanding feature in connection with school-work during the year under review was the shortage of suitable accommodation. School Boards have faced the situation with courage and determination, but their repeated efforts to secure adequate funds have been defeated by a section of ratepayers who are apparently determined to allow the efficiency of our schools to suffer. The burden of taxation necessary during the reconstruction period through which we are now passing has led to the repeated defeat of by-laws by which Trustee Boards sought to secure means that would provide suitable accommodation so urgently needed.

The voters who defeated the school by-laws may have succeeded in avoiding a slight increase in taxes, but they have also been eminently successful in increasing the burdens of the teachers, in causing great anxiety to interested parents, and in taxing the ingenuity of those immediately connected with school administration.

Undoubtedly we are passing through times when economy should be practised to the utmost; but this policy of curtailment is not one of wise economy. There were over 1,400 children working on part-time system and thereby receiving only a portion of the instruction and development to which they are entitled. By this curtailment of privileges probably 250 of these children will have to repeat a term's work, thus adding a half-year to the period of their school-life. Primary teachers are severely handicapped by the part-time system. Then, too, we should remember that it can hardly be regarded as good business to pay two teachers for a full day's work when it is known that they are working under conditions that permit of the production of only half a day's results, no matter how strenuously the teacher may labour.

The building programme for the year was restricted and inadequate, as it provides only for immediate requirements. In the rural districts two one-room buildings were erected, one at Pender Harbour and the other at Sechelt. In Richmond a frame building was provided on Sea Island for an Oriental class, and provision was made for a two-room frame building of modern construction at Steveston. At the Strathcona School in Vancouver City an old brick building which had been condemned was torn down, and a new eight-room building erected largely from material obtained from the old structure. This building occupies a large area as it is a one-story type. Provision was made for a full basement which will be urgently required for play purposes, as the grounds at this school are altogether too small for the large number of pupils attending. When this new building is opened, four classes, that for over two years have occupied rooms in the attic which were dangerous and unsanitary fire-traps, will have suitable quarters.

In order to cope with exigencies imposed by financial stress produced by the war the Vancouver Board has decided to provide a number of cottage class-rooms. Provision has been made for one-room buildings at Aberdeen and Bayview, and two-room buildings at Dawson, Hastings, Mount Pleasant, and Macdonald. If these new buildings are ready for occupation when the schools reopen, all classes will be comfortably provided for at the beginning of the new school-year; but part-time classes will again be necessary in February unless more accommodation is provided in the meantime.

The adoption of the cottage system, occupying as it does so much ground-space, is destroying the usefulness of the playgrounds and detracting from their appearance. In this respect the Aberdeen, Dawson, Macdonald, and Strathcona Schools are at present the most severely handicapped.

The past year has been one of earnest endeavour by the great majority of our teachers. Intense application and enthusiasm did much to overcome the disadvantages incident to lack of suitable accommodation. There is at present a decided forward movement in the educational world. Teachers as a rule are displaying keen interest in the welfare of the children placed under their care. The adoption of project methods and socialized efforts are demanding more and more attention. Actuated by a spirit of greater service and a desire to increase their own efficiency, a large number of our teachers are attending summer schools, and taking special courses during the summer vacations in Washington and in California, as well as in our own Province.

I was also impressed with the amount of reading that teachers are doing in connection with newer movements along educational lines. Among the writers that seem to receive most consideration are: Adams, Bagley, Cubberly, Dewey, Horne, James, Judd, Monroe, Starch, Strayer, Suzzalo, and Whipple. The spirit of curiosity and a desire to be more humanitarian are leading to a careful study of the investigations of Binet, Ballard, Termen, and Anderson; and a desire to render more efficient service and to ascertain to what degree their efforts are up to standard has popularized such names as Curtis, Otis, Woody, Ayres, etc.

On some the effect of all this reading is disquieting and creates a feeling of dissatisfaction. Many are being benefited, but realize that a royal road to learning has not yet been discovered; that it is still the teacher's duty to study, work, and arouse the child's interest; that the pupils must be led to cultivate, among other good habits, accuracy and the power to make intense application. We have some earnest and conscientious teachers who believe in rapid and radical

changes; they are overanxious to labour in the "schools of to-morrow." Energy and enthusiasm for the new make them so impatient with much that now exists in the present system of education, and they fail to realize that some things are basic and thus essential in all ages. To such teachers I would suggest a careful reading of P. Monroe's "History of Education," with special attention to the last chapter.

SALARIES.

I am pleased to note the salary increases of the past year. The teachers in both the city and the municipality have appreciated this liberal treatment; in the outlying districts your Department has acted both wisely and generously.

No better way of reaching and maintaining a high salary level is within reach of teachers than consistent effort for a higher standard of achievement. Evidently most of our teachers are already deserving, as evinced by preceding paragraphs. However, for the sake of the few teachers who do not recognize the signs of the time, let me quote one writer's opinion:—

"Educational outputs are not to be measured like those of factories; it is the quality, not the amount, of manhood and citizenship that counts. The teacher on her part will command respect in due proportion to her efficiency and the quality of her work. And as she convinces the community of her worth and her labour so she will receive an adequate financial return. It is time, we think, to cease shouting the rights of teachers from the housetops and to merit the present increased salaries by sheer efficiency. The agitator who would have teachers reduce the superintendent's authority and check the legal prerogatives of the School Board had better get back to her text-book and supplement her last year's lesson-book with some freshly gathered teaching wisdom."

Any salary policy of School Boards who have the welfare of their communities at heart must decidedly rule out the consideration of reductions in salaries and of discontinuance of the stated increases provided in existing schedules. In some communities adjustments of schedules must be made in the direction of higher maximums for special merit and experience. And there are numbers of smaller communities which are still below a fair schedule that will hold teachers from going to adjoining towns only by further increase. I am pleased to report that some of the assisted schools, where boundaries are defined, have decided to increase the teachers' salaries.

HELPFUL ORGANIZATIONS.

To those engaged in educational work it is encouraging to find that the public at large is displaying an increasing interest in educational work. This has been shown by the actions of various clubs, chapters of the I.O.D.E., and Parent-Teacher Associations. Certain chapters of the I.O.D.E. have supplied some schools with milk for children whose physical condition required special attention. One I.O.D.E. chapter supplied over ninety volumes to start a library in one of the Coast schools situated about 30 miles from the city. The happiness and information derived by the pupils of that favoured and favourite locality was to the teacher, before she left the district, ample reward for the efforts she had made in the matter; but many who helped in the good work can only hear of the delight, pleasure, and profit brought to those isolated children by so many books rich in picture and story. The Parent-Teacher Associations have encouraged many teachers; they have assisted in enlarging libraries and provided funds to purchase the copy or provide frames for many of the good pictures that now adorn the walls of nearly all our schools. The work of a foster Parent-Teacher Association for the Children's Home School is deserving of mention.

The school as much as the home needs co-operative effort such as expressed in those organizations. And the large city school needs it more than small schools in the town or rural district. It has been well said by an educator: "There is no other co-operative agency so much needed by the home. There never was a time when the need was so great for intimate connection between home and school as at present. The conditions of modern life are so complex, opportunities for good and evil are so numerous, the occupations of the home are so meagre unless they are related to the school, and the work of the school is so abstract unless it has a practical outcome in the home that it is imperative for parents and teachers to get together."

SCHOOL-WORK.

As to the charge that our schools are overrun with novelties, what shall we say? Unfortunately a casual survey of elementary education seems to bear out the charge. There certainly are a host of new things being tried on children these days. To mention a few, there are the prevocational school, the all-year school, supervised study, socialized recitations, project method, standard tests, the Dalton plan, etc.

The general blanket excuse for all these novelties is that progress means change, that only by trying out new ideas can we judge of their value, and thereby ensure the advancement of the school toward higher efficiency. Undoubtedly it is true that progress means change, but change does not necessarily mean progress. There is such a thing as change for the worse, and it is possible to have too many and too radical changes. In other words, no educational experiment can be justified merely on the ground that it is different and therefore means progress. On the other hand, without experiments we cannot know the real worth of new things in education, or whether their adoption will spell progress. So thoughtful educational administrators are face to face with a dilemma: they cannot progress without experimenting, and they cannot experiment without running the risk of overdoing it. They can, however, learn much from the experiences and results obtained by overardent experimentors, and experiments can be tried on a scale that will not upset an established system. A recent survey of educational matters in a large neighbouring city found that some recent experiments did not stand for progress and one of the novelties was discarded as worthless. Nevertheless, from some of these novelties we are gaining useful information which will assist in readjusting the curriculum and in introducing methods that will more effectively meet the requirements of rapidly changing social and psychological conditions.

In the graded schools the work of the primary classes is conducted with skill and energy and in a highly successful manner. There is, however, a tendency to lower the standing in spelling. To my mind the general standing of First and Second Reader classes is not satisfactory; and the eighteen-month period spent in covering this section of elementary school-work cannot be regarded as a period productive of adequate results. That this portion of the prescribed course can be performed satisfactorily and efficiently is demonstrated by the work of several capable teachers; but many teachers doing this work are weak and lacking vision. How came they to this particular work which is generally regarded as requiring less skill or effort than that required to teach successfully any other portion of the Public School Course? Among them are many teachers who could not come up to the high standards required by a capable primary supervisor, and others who, having neither ability nor aptitude for higher work, failed as Intermediate or Senior Grade teachers. It is true that some of those weak teachers who are doing this work get good results in spelling, reading, and drawing; they even succeed in getting their pupils to memorize the multiplication tables, but they fail to develop number-power; they do not introduce geography properly nor continue the good work already started in oral and written composition in primary classes. A supervisor for this period of work is required in order that there may be more uniformity of purpose and that work of a higher standard may be attained. Then pupils upon entering the Intermediate Grade will be better equipped to meet the difficulties peculiar to that grade. Proper supervision during this period would also save many young teachers from failure and render unnecessary some painful dismissals.

Generally speaking, there has been an improvement in the work of Intermediate Grade teachers. The first year's work in this grade is arduous; it requires skill, patience, and careful preparation on the part of the teacher. Much of this burden would be removed if we had better work in the latter part of the previous grade.

As a rule the work of the Senior Grade is satisfactory. There is, however, in some schools a tendency toward less exact information on the part of the pupil. Some teachers attempt to justify this on the ground that the pupils are gaining a broader information. This may be so, but there is danger of this broad information having a shallowness akin to veneer.

It may be regarded as an open question whether principals of city schools should have the privilege of promoting all their Entrance pupils to high school without Departmental Examinations; or whether they should recommend a percentage as is done in large rural municipality

schools? Most of our principals are using good judgment in this matter, but I have grave doubts regarding the fitness for higher work of some of the pupils recommended from some classes.

Since the return of the drawing supervisor there has been a decided improvement in connection with this subject. Nature-studies are a source of worry and doubt to many anxious and conscientious teachers. In composition-work the average results are rather discouraging. Our senior pupils do not, as a whole, display ability in criticizing intelligently their own written work; too many expect the teacher to discover and mark errors in spelling and omissions in punctuation.

I have, etc.,
J. T. POLLOCK,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 4.

VANCOUVER, B.C., September 2nd, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I have the honour to submit the following report on the schools of Inspectorate No. 4 for the school-year ended June 30th, 1921:—

The following schools comprised this inspectorial district: Public schools in the Rural Municipalities of Maple Ridge; Mission (with rural and assisted schools adjacent); Pitt Meadows; and the Cecil Rhodes, Franklin, Florence Nightingale, General Gordon, Grandview, Laura Secord, Livingstone, Model, Seymour, Simon Fraser, and Lord Tennyson Schools in Vancouver City. The total number of class-rooms, including both rural and urban schools, was 189. One visit of inspection was made to each division in the city schools, while two visits of inspection were made to each division in the rural municipality and rural and assisted schools. In addition to the regular visits of inspection, a considerable number of special visits were made to the rural districts in connection with the various questions of organization, consolidation, and school administration generally.

During the school-year under review an assisted school was established at McConnell Creek, in the Dewdney Electoral District, and the Rural School District of Dewdney was incorporated with the Mission Municipality School District. The Senior and Intermediate Grade pupils of the Dewdney District are now conveyed daily by motor-van to and from the Mission Central School.

All credit is due to the progressive citizens of Dewdney and Mission Districts, who at a time when all schemes of consolidating schools were meeting with defeat in neighbouring municipalities were courageous and public-spirited enough to adopt a policy that cannot fail to provide superior facilities for the education of the children of the district.

In many respects the work of inspection during the year has been carried on much in the same way as in the year previous. There is little to recount that has not already been written and rewritten in reports of this character.

There is one dark and disturbing feature of our work that we cannot escape. I refer again to the cruel overcrowding of our children in the public schools. The old woman who lived with her numerous progeny in a shoe had large, spacious, and luxurious quarters compared to those in which thousands of benighted children spend their hours of school.

This theme has been given so much attention of late, both in the press and on the platform, that there is no need to make any lengthy reference to it here. To argue that under existing conditions the intellectual progress of the pupils is not being retarded is to give vent to mere sophistry, and to state that the health and physical well-being of these children are not being impaired is to ignore the inexorable laws of a universe whose maker and builder is God.

As reports on each division of every school included in this inspectorate have been forwarded from time to time during the school-year, it would be vain repetition to make any detailed reference to the actual work observed in the class-rooms. In concluding this brief and general report, I shall therefore refer very briefly merely to one or two features of the work in general.

In striking and most pleasing contrast to the discouraging difficulties under which the work was so often carried on was the splendid spirit displayed by the great majority of our teachers in both rural and urban communities. As it has been spoken of the pioneers of Canada that their courage rose with peril, so it may be said of our public-school teachers that they have risen bravely, cheerfully, and uncomplainingly to meet every situation, however beset with difficulties.

In the primary classes of the Junior Grade in the Vancouver City Schools very excellent work was accomplished in some cases. This work is under the supervision of a special supervisor. At the end of the fall term it was possible in many schools to promote a considerable number of pupils from the Receiving class direct to Second Primer, thereby saving a half-year at school. In one case at the Cecil Rhodes School it was found possible and advisable to promote two supernormal Receiving class pupils direct to First Reader, thus saving for these pupils a whole year of public-school life.

This instance, I believe, affords an argument in favour of the introduction and stressing of standardized tests and mental measurements in our schools. It is my opinion that, if opportunity were given for the application and scoring of such tests as Whipple, for instance, has designed and prepared for the segregating of gifted, accelerated, or supernormal children as they are variously termed, a radical change would follow in the grading and classification in our schools. These accelerated pupils would be separated from the normal children as the subnormal pupils have been and would be given work commensurable with their abilities.

In the visiting of schools in various parts of this Province for the past ten years the conviction has been growing upon me that in the work of the elementary school sufficient stress is not being laid upon what are usually termed the essentials. Our Public School Curriculum includes many branches of study. For Entrance to High School pupils are examined in eleven subjects. In addition to these, we have manual training, domestic science, physical drill, music, and school-gardening, all of which are necessary and fulfil an important function in the education of the child.

In arithmetic lack of accuracy and of speed in ordinary computations and calculations is common to all classes and grades of public schools. In testing Intermediate and Senior Grade classes particularly, I have met with surprisingly poor results.

In the primary grades in rural schools objects are not used sufficiently in order to assist the pupils to grasp clear concrete ideas of number. Number is too often taught in the abstract only. Even in schools where the combinations and separations have been well taught in the Primer classes—and this applies to city schools as well—and the extensions of the same have been taught and tables builded in the First Reader, a weakness develops in the Second Reader class for the simple reason that the work of the previous grades is abruptly dropped and never by any chance reviewed. I find a tendency, all too common in the large graded schools of the city, for the teacher to "stick to her limit" and to refrain religiously from reviewing the work that preceded her "limit." In a subject such as arithmetic such a policy is fatal. The retentive powers of the children are not strong, and no matter how well foundational work in arithmetic may have been taught by the previous teacher a lasting impression cannot be made upon the conscious mind unless there is careful and periodical review. In the Intermediate Grade the denominate numbers are not well taught. Here again there is lack of concreteness. To get clear concepts of these things the children must be shown the meaning of and the necessity for the various units of measurement, and they must be set to work to measure things, to make actual measurements, and to compute and to calculate the result of their individual observations. In the Senior Grade there is far too much time spent on written problems and far too little time given to mental calculations. Assign to the average Senior Grade class a difficult problem on a certain page of their arithmetic, and probably 90 per cent. of the class will work it out beautifully. Assign to the same class the problem of computing the area of a city lot, and answers will vary from almost zero to hundreds of thousands of acres!

Under the caption of English I would, of course, include Reading, Literature, Grammar, Composition, and Spelling. If there is one thing more than another that requires stressing in our public schools, it is surely the study of English. The necessity for the development of language-power must be impressed upon every teacher in the land. The power of expression, both oral and written, attained by our pupils leaves much to be desired.

There are several reasons possibly for the rather low standing in English in rural schools particularly. Too often in such schools the teacher's training in English has been limited. A

much more extensive and intensive course in English for teachers-in-training should be insisted upon. Libraries should be installed in every school in the land, so that both teachers and pupils could have access to "whole treasures of wisdom, bright gems of thought, and golden veins of language."

Too often the pupils get little or no opportunity for discussion. Practically all the recognized talking is done by the teachers. In schools where dramatization methods are employed in teaching history and literature, and where socialized methods are in vogue whereby pupils take the main part in the discussions, one finds language-power developed to a high degree.

In concluding this report, I should like to refer very briefly to the convention of the Fraser Valley Teachers' Institute held last November at Mission, in this inspectorial district. For a number of years past the public- and high-school teachers of the Municipalities of Maple Ridge, Mission, Matsqui, and Sumas have held a convention at Mission City in November of each year. The success which has always attended this convention has been due largely to the enthusiasm and untiring efforts of the Mission high- and public-school teachers. A particularly successful convention was held last November. Some very able and helpful addresses were given and papers read by visiting teachers from Vancouver and Victoria.

The teachers in these rural municipalities take the keenest interest in this institute and receive help and inspiration from the various discussions. In a previous report I have suggested that an institute day might be set aside each school-year for the holding in different portions of the Province gatherings of this kind.

I have, etc.,
H. H. MACKENZIE,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 5.

VANCOUVER, B.C., August 30th, 1921.

S. J. Willis, Esq.,
Superintendent of Educatiaon, Victoria, B.C.

SIR,—I beg to submit the following report on the public schools of Inspectorate No. 5 for the school-year ended June 30th, 1921:—

This inspectorate comprises the following schools in Vancouver City: Alexandra, Central, Fairview, Henry Hudson, Lord Nelson, Lord Roberts, and School for the Blind; also those in Point Grey Rural Municipality, ten schools in and near Powell River, and the Provincial Oral School.

For various reasons the character of the teaching in the Vancouver schools is well above the average; nearly all the teachers had proved their worth elsewhere before they were appointed to the city staff; they are assisted by a number of supervisors who are specialists in their own departments; all are directed by a very capable, efficient, and conscientious Municipal Inspector. But the progress of the pupils depends upon more than the training, ability, and devotion of their teachers and supervisors. Many pupils are retarded by circumstances over which the individual teacher has no control. The ratepayers still refuse to vote the necessary money for school accommodation to meet the increase in school attendance, and therefore the evils of part-time tuition and overcrowded class-rooms continue. Many parents take little intelligent interest in the education of their children. Many children are addicted to the moving-picture habit, with its late hours and unhealthy excitement, and have to some extent lost the power of becoming interested in mere books and oral instruction. In a few schools the principals do not spend enough time on the "supervision over the classification, time-tables, exercises, methods, and general discipline pursued in the lower grades." But on the whole the progress of the pupils, particularly in the primary grades, seems to compare very favourably with the progress made in other places.

For some years good work has been done in Vancouver by psychologically testing the younger pupils to detect the ones who are subnormal; these are removed from the ordinary class-rooms and taught in special classes. Not only is the ordinary class no longer retarded by their presence, but the subnormal children themselves make much better progress, attempting only subjects within their mental powers, and taught by teachers specially selected and trained for this work.

It is to be hoped that public opinion will soon permit the School Board's psychologists to undertake a more important phase of their work—the selection of the supernormal pupils and their segregation into special classes. These pupils are at present retarded by being subjected to methods of teaching and a rate of class-progress necessarily planned for the more numerous normal pupils, retarded in much the same way as the normal formerly were by being taught with the subnormal. The progress and training of the supernormal pupil is of far greater importance than that of the subnormal, because it is from that class the leaders of the next generation should come.

In 1920 the public schools of Point Grey closed for the midsummer holidays with thirty-eight divisions and reopened with forty-eight; four more were opened during the school-year. To accommodate the new classes two modern fire-proof school-houses were completed, while two others are now under construction, one of which will be ready for use in September. The ratepayers continue to vote money for the further construction which will be necessary to cope with the rapidly increasing school population, part of which is doubtless attracted to Point Grey by the excellence of its schools and school buildings.

The Powell River School has grown during the year from five divisions to seven, and two class-rooms were added to the main building. The district is to be congratulated upon having a School Board which does not permit the question of salary to stand in the way of obtaining a good teacher. All supplies needed were also generously granted. The results obtained in the school were very satisfactory during the year under review and should be even better during the coming year.

A division was closed at Vananda and a school was opened at Stillwater.

At the beginning of the school-year the Oral School was taken over from the Vancouver School Board by the Provincial Government and housed temporarily in the Shaughnessy School Building; it will soon be moved into a permanent and more suitable home. The outstanding feature of the instruction in this modern school for the deaf is that the pupils are not taught to converse with their fingers, but are taught lip-reading and audible speech. The progress made by the children in this art is remarkable, particularly in the principal's own class.

I have, etc.,

LESLIE J. BRUCE,

Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 6.

VANCOUVER, B.C., August 31st, 1921.

S. J. Willis, Esq.,

Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit my annual report on the public schools in Inspectorate No. 6 for the school-year 1920–21.

The inspectorate comprises all the public schools in the City of Port Moody and the Municipality of South Vancouver; the assisted schools on Burrard Inlet, Howe Sound, and the schools on the Pacific Great Eastern as far north as Seton Lake. The number of class-rooms in the inspectorate during the year was 181.

In September, 1920, the schools of South Vancouver opened with 152 teachers engaged and an enrolment of 6,286. In February, 1921, there was an increase of seven teachers and 172 pupils. The Gordon School was opened in February with eight divisions in operation. This relieved the overcrowding at the Mackenzie and Tecumseh Schools. A four-room addition is being constructed at the Richard McBride School and a four-room frame building is being erected at the General Brock School. This building programme promises to care for the increase in school population for the coming year at least.

In the outlying parts of the inspectorate a new four-room building is being constructed by the Government on the new townsite at Ioco. The trustees of Sunnyside No. 2 School District are enlarging the present small building and making it more comfortable for the children.

The High School Entrance Examination results this year indicate that the Course of Study is being closely followed and a high percentage of the candidates sitting for the examination were successful. In the Municipality of South Vancouver 196 candidates were promoted by

recommendation. One hundred and fifty pupils sat for the examination and eighty-nine were successful. Two schools that were not entitled, under departmental regulations, to promote by recommendation sent up twenty-three candidates and passed them all. These two schools, Secord and Sexsmith, are deserving of special mention owing to the high standard of marks obtained by their candidates. In the rural part of the inspectorate the results were quite satisfactory, although not equal to the standard obtained by the larger graded schools.

In this report I must express my appreciation of the valuable work that is being carried on by Miss A. T. G. Reid, primary supervisor in the municipal schools of South Vancouver. Her helpful criticism, careful organization, and the splendid co-operation she has secured from the primary teachers have resulted in increased efficiency on the part of the teachers and a most satisfactory decrease in the number of retarded pupils in the Primer classes. A creditable improvement has resulted in the handling of all subjects, particularly number-work, penmanship, and spelling.

The prizes for excellence in physical training under the Strathcona Trust Fund were awarded as follows:—

First—Miss H. R. Anderson, 2nd Division, Lord Selkirk School, South Vancouver.
Second—Mrs. Hazel H. Jex, 5th Division, Sir Alexander Mackenzie School, South Vancouver.
Third—Mr. Geo. Wate, 1st Division, Secord School, South Vancouver.

A change in the method of carrying on the physical drill has been instituted in a number of the schools. The drill takes place at a given time, when all the divisions march to the playground. The principal supervises the drill carried on by the staff and handles the larger boys. I find the plan a good one and it is working out quite satisfactorily. The period is also utilized for games, open-air action-songs, etc.

Regular reports on the school-work of each teacher have been forwarded to your office from time to time and it is unnecessary to make further comments in this report. The greater part of my inspectorate is in the larger centres and the educational facilities are of the best to be obtained. Trained and successful teachers are given the preference in selecting new members to the different staffs. The careless, indifferent teacher finds that she must give a satisfactory return or retire. This tends to add strength to the staff and increased efficiency from year to year. Many of the teachers are availing themselves of the opportunity to become more proficient and modern in their methods by attending the University summer school here or in the United States. The summer school in Victoria is doing valuable work in training teachers in the practical part of teaching by giving them assistance in subjects such as drawing, manual-arts, penmanship, and nature-study. That these courses commend themselves to the teachers and that they spend their vacation in self-improvement indicate the high plane on which the greater number of the teachers place their profession.

I have, etc.,
JOHN MARTIN,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 7.

VANCOUVER, B.C., September 10th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I have the honour to submit the following report on the public schools of Inspectorate No. 7 for the school-year ended June 30th, 1921:—

This inspectorate embraces all the public schools in the Cities of North Vancouver and Port Coquitlam; the Rural Municipalities of Burnaby, Coquitlam, Delta, Kent, North Vancouver, and West Vancouver; and the rural schools in the vicinity of Hope and those on the Coast from Lund to Cape Scott. There are in all seventy-five schools with a staff of 192 teachers.

With the exception of a few schools in the vicinity of Alert Bay, every class-room received one inspection during the year. I was assigned to this inspectorate in October and began the work of inspection early in November. Time did not therefore permit of a second visit to any of these schools.

Owing to increased attendance a number of class-rooms were overcrowded. This condition prevailed especially in North Vancouver City, Burnaby, and West Vancouver. The Boards succeeded in providing relief by securing temporary quarters, but where this was not possible certain Junior classes were placed on "double-shift"—a system that has proven very unsatisfactory.

The ratepayers of Burnaby carried with a large majority a money by-law making provision for a four-room building at Kingsway West, a similar one at Edmonds, and a four-room addition at Nelson Avenue. These are now in the course of construction. When completed they should provide ample accommodation for that rapidly growing section of the municipality. A money by-law providing for a central school in West Vancouver failed to carry, although West Vancouver is in urgent need of more accommodation. In North Vancouver Municipality the Board has completed a splendid four-room brick structure at Lynn Valley.

In Kent Municipality consolidation has been in effect for over a year. The pupils from the outlying rural districts are conveyed in motor-vans to the town school. The plan is working well and there is no desire on the part of those concerned to revert to the old order of things. In the Delta consolidation is being discussed. It is to be hoped that this municipality, where conditions are ideal for such a plan, will not long delay making provision for its inauguration.

The Entrance Examinations in June were conducted at seventeen centres. The results on the whole proved quite satisfactory. In the larger schools where pupils were promoted on recommendation the principals exercised careful discretion. The Governor-General's bronze medal for the district was awarded to Miss Mildred May Townley, of Kingsway West School, Burnaby. Miss Townley also won distinction by obtaining the highest mark for the Province.

The prizes for excellence in physical drill this year were awarded as follows:—

First—Miss M. Simmons, 7th Division, Kingsway West.

Second—Mr. J. Burnett, 4th Division, Gilmore Avenue.

Third—Miss Morrow, 3rd Division, Kingsway West.

The work in the schools throughout the year was very satisfactory. The great majority of the teachers are earnest, capable, and most painstaking in their efforts. Any suggestions made were generally received in the same kindly spirit in which they were given. The teachers generally showed a splendid disposition to co-operate in any recommendations suggested for the betterment of their class-room work. The attitude of the teachers as a whole was most praiseworthy. There are a few, however, in the profession whose work, even when viewed in the most kindly and sympathetic light, could not be considered as even fair. These people would be happier in some other vocation.

In concluding, I wish to testify to the earnest and unselfish service rendered by members of School Boards. They are to be commended for the sacrifice they make in giving, gratis, many hours of their valuable time to serve their community. Their work has not been easy. Their hands have been tied, as it were, by the taxpayer, reluctant to vote sufficient money with which to carry on the work. While Boards have been handicapped and while teachers have not always found conditions under which they laboured most pleasant, yet it is to be hoped that as this year of reconstruction passes away a brighter future lies before us.

I have, etc.,

F. G. CALVERT,

Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 8.

NEW WESTMINSTER, B.C., August, 31st, 1921.

S. J. Willis, Esq.,

Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit report on the public schools of Inspectorate No. 8 for the year 1920–21.

This inspectorate comprises the schools of New Westminster, of Chilliwack, and of the Rural Municipalities of Surrey, Langley, Matsqui, Sumas, and Chilliwack; Abbotsford Superior School; and the assisted schools of Barnston Island, Cultus Lake, and Popcum. The number of rooms in operation during the year increased from 179 to 187; 75 of these are in New Westminster and Chilliwack and the remainder in rural schools.

Besides making a number of special visits in connection with various details of organization and administration, I was able to make one complete inspection of the work in all but two of these schools, and in cases where circumstances demanded I have made two or more inspections during the year. Meetings of teachers', parent-teachers', and farmers' associations in New Westminster, Chilliwack, Abbotsford, Rosedale, Cloverdale, and elsewhere have been attended and all possible assistance given in discussions on educational matters, and from time to time I have been present at the regular meetings of Trustee Boards.

The most urgent problem in these rural areas is still that of providing school accommodation, and a total increase of eight rooms in this inspectorate by no means indicates the real increase in the number of children of school age, many classes having been seriously overcrowded during the year. Owing to the defeat of by-laws to provide large consolidated schools in Surrey, Langley, and Chilliwack, the School Boards have been reduced to such temporary expedients as "double-shifts," renting disused stores and buildings, and half-time attendance, to the serious inconvenience and detriment of educational work. Some alleviation of the situation may be expected during the coming school-year in Surrey and Chilliwack, where the acceptance of moderate building schemes will, at any rate, relieve these Boards of the necessity of turning away children. And yet these schemes are purely tentative; they are not in line with modern educational ideas, and the normal growth of school population will in a very few years render further extensions necessary. The mere addition of a second room to an overcrowded one-room school cannot be regarded as more than a temporary makeshift, especially where the location of schools and child population and the condition of the roads make feasible a system of better grading by means of local consolidation. It is to be regretted that these otherwise well-informed and enlightened rural communities have so far failed to put themselves in line with any advanced and progressive educational policy so far as school buildings and organization are concerned. Ambitious and costly schemes are not called for; in these days of high prices a carefully designed, well-equipped frame building will meet all requirements; but since accommodation must be provided, should we not demand that buildings conform with modern ideas rather than resurrect the type of structure that satisfied our fathers and our grandfathers? Luxurious barns for cattle, up-to-date silos, demonstrations of electrical appliances for farm-work, are shown at agricultural exhibitions; but why not include exhibits of a model school building, a relief-map of a consolidated-school district, auto-vans for transportation of the children, charts demonstrating comparative costs and efficiency? Included might also be a specimen van-driver (non-smoker, abstainer, and thoroughly trustworthy), medical statistics showing liability to disease of children riding as compared with those trudging on foot, mortality tables showing deaths (if any) from accidents to vans en route, etc. A whole-hearted campaign of publicity and enlightenment is needed, backed by the most liberal financial inducement to those districts that will adopt and persevere with an advanced and progressive policy. Of all men, the Fraser Valley farmer understands the value of co-operative and up-to-date methods in his farming and marketing operations, though conviction probably came as a result of bitter experience and a tedious and costly campaign; he is equally open to conviction in school matters, and he will become just as loyal and enthusiastic a supporter of such methods in education once he is convinced of their value; his distrust of an education which drove the ambitious country child into the city has not yet been replaced by the knowledge that the best in modern education tends to bring the child back to the land.

Turning to actual work in the schools, detailed reports have been regularly forwarded and only one or two salient features need be referred to here. In the ungraded and partially graded schools of country districts—as reported last year—the work attains a surprisingly high level when account is taken of the difficulties under which it is carried on; in two respects there appears to be an improvement over work previously done—the ever present problems of organization and grading are being more effectively dealt with, and many teachers are making a more deliberate and conscious effort to establish the oneness of life inside and outside of the school and to utilize the child's home and out-of-school experiences and activities as the basis for training. Incidentally it may be remarked that considerably larger proportion of children from the one- and two-room schools were successful in the High School Entrance Examinations this year. There were in these schools fewer staff changes than heretofore, and it is satisfactory to note an increasing desire to secure the services of the more highly qualified teachers rather than of those possessing the minimum professional standing. During the last year or so a number of

university graduates, particularly those of our own University, have engaged in public-school work. This is a welcome sign, for many of these young graduates bring to their duties a wide range of interests, intellectual keenness, a broad outlook and sympathy, as well as readiness to learn, and it is to be hoped that it will be possible to retain some of them permanently in the ranks of our public-school teachers. Possessing qualifications enabling them to teach in high school, they are looking in that direction for permanent positions, and the cause is not far to seek. Owing to the mistaken idea that public-school work is easier and of less importance than high-school work, with corresponding prejudice against the former (a prejudice originating in older countries, where *free* education was long regarded as of necessity *cheap* education), the unjustifiable conclusion has been drawn that in the newer countries, where public opinion demands that the State provide the highest educational facilities for all alike, work with the younger children must necessarily be less generously remunerated than that of the higher grades. A teacher's salary, however, should be determined by his qualifications (including, of course, professional training and successful experience), and local authorities should keep this in mind when fixing remuneration if they desire to retain in their service the more highly qualified teachers.

In the larger rural schools and in the graded city schools the usual level of achievement has been reached, and in certain schools and classes the work has been excellent. Some of the advantages enjoyed by larger graded schools are not utilized to the extent they should be; staffed in the main by teachers of experience, regularly supervised by a principal, with their carefully and accurately graded classes, they might provide ideal conditions for work of the highest type. The reasons for undue retardation of individuals, or even of the whole classes; the question of the supernormal child; standardized tests applied to the teaching; intelligence tests applied to the grading—these and many other problems are occupying the attention of investigators, and the principal or teacher imbued with professional spirit will at least inform himself of their conclusions, and satisfy himself that nothing is left undone that can aid in his own professional work. Education is a dynamic subject, dealing with the spiritual and intangible, and we teachers can never sit down and say, "We *know* it all," whether we attribute our wisdom to excellent Normal training or to valuable and unparalleled experience. Safety lies in progress.

School-gardens are in operation at most schools in this inspectorate, agricultural supervisors exercising general oversight in Surrey, Langley, Chilliwack, and New Westminster. This branch of activity appears to be intelligently utilized, and most of the teachers recognize the great educational value of the school-garden as providing an opportunity to base much of the formal training upon the interests and activities of the child. In the graded schools increasing attention is being paid to organized games and play; in the smaller schools more should be done and the children are too much left to amuse themselves without any assistance or supervision by the teacher. It frequently happens that a majority of the children remain during the noon recess; supervision at that hour is not compulsory, but it is difficult to understand how a conscientious teacher who has at heart the moral training of the pupils can afford to neglect this opportunity of getting into closer touch with them and of observing and influencing them under out-of-school conditions.

Only in New Westminster and in Chilliwack City and Township are manual training and domestic science included in the curriculum; in the other municipalities provision should be made for the inclusion of these important branches by establishing centres which children from adjoining schools could conveniently attend. Parent-Teacher Associations are increasing in number and activity throughout the district, and, as focusing the interests and efforts of the ratepayers so that the local school becomes a live issue to the community, they are doing excellent work. In addition to their primary aim of strengthening the bond between school and home, their efforts toward the beautifying and laying-out of school-grounds, the provision of play apparatus, the supply of hot lunches, the supplementing of school equipment by providing piano, gramophone, library books, or pictures, and the active support of money by-laws, indicate only some of the directions in which they are making their influence felt.

I have, etc.,

ARTHUR ANSTEY,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 9.

KAMLOOPS, B.C., August 30th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit herewith the following report on the public schools of Inspectorate No. 9 for the school-year ended June 30th, 1921:—

The following were the number of schools in operation in this inspectorate during the year:—

	Schools.	Teachers.
City municipalities	3	29
Rural municipalities	7	8
Rural schools	26	36
Assisted schools	71	71
Totals	107	144

Eight new assisted schools were established and in operation for the first time during this year. Two new divisions were opened in Kamloops City School, and one each in Merritt, Lillooet, Clinton, and Fruitlands. Canford School District was lowered to the status of an assisted school. The schools at Rae Lake, Heffley Lake, Copper Creek, and Chase Creek were closed throughout the year.

The number of ungraded schools in this inspectorate (90 per cent. of the total number of schools), the extent of territory to be covered, and the difficulty of access in very many cases rendered the work of inspection somewhat difficult. However, all the schools in operation, with one exception, were visited once, and a second visit was made to the majority of the schools during the year. I have endeavoured to pay special attention to the schools employing inexperienced teachers, and have confined my work in such cases mainly to assisting the teacher in the organization of classes and to instruction in the general work of the school.

Over 20 per cent. of the teachers employed in this inspectorate during the year under review were in charge of schools for the first time, and a number of others had had no teaching experience previously in this Province. Frequent change of teachers has been a great detriment to the advancement of the work in the smaller rural schools, but as the country districts become more thickly settled and living and social conditions improve therein, it is hoped that this condition will in a large measure disappear. I wish here to pay tribute to the courage, perseverance, and tactful ability of the teachers (many of them young girls from city homes) who are doing the pioneer work in teaching in the more remote and isolated settlements. Many of these teachers have cheerfully adapted themselves to new living conditions, and wherever they have met with the hearty co-operation of the parents of their pupils they have invariably maintained excellent schools.

During the year just closed the question of providing increased school accommodation has been a very pressing one with the members of School Boards, especially in the larger centres. In Kamloops City much difficulty has been experienced in finding accommodation to meet the increase in enrolment. A new eight-room school building is now in course of construction which will supply accommodation for the public-school pupils who are at present housed in temporary quarters about the city and in the High School building. The old Public School building is undergoing extensive repairs with the object of improving the heating and sanitary arrangements of the building. Much credit is due the Kamloops Board of School Trustees, and the ratepayers as well, for the enterprising spirit they have displayed in the matter of providing every facility for the carrying-on of the work in the schools. Work on the projected addition to the Merritt Public School was not proceeded with this year, but it is hoped that better accommodation will be provided for at least two new divisions during the coming school-year. It has been found necessary also to provide additional accommodation in several of the rural and assisted districts, where the increase in enrolment has outgrown the old school buildings. On the whole, the school-year just closed has been a period of expansion, and the School Boards throughout the inspectorate, with the assistance of the Department, have been generally successful in their efforts to provide the additional accommodation necessary to meet the demands of the growing school population.

The quality of the work performed in the various schools in this inspectorate has been at least equal to that of the preceding year. More attention is being given to the teaching of writing and to inculcating habits of neatness and care in written exercises and note-book work. A sincere effort is being made in a large number of the schools to lead the pupil to do his own reasoning, and to present the work in such a manner as to appeal to the practical common-sense as well as to the imaginative ability of the pupil. In most of the schools visited the arithmetic and reading were usually good; history and geography, however, become too often dry and lifeless subjects owing to the methods of presentation to the class.

High School Entrance Examinations were held in eleven centres in this inspectorate in June last. The Governor-General's medal for the inspectorate was won by Philip Clark Fraser, a pupil in the Salmon Arm City School. The quality of the work performed in the Senior Division of this school throughout the year is most commendable, and the high percentage of successful candidates from this school in the recent High School Entrance Examination, as well as the excellent standing in all subjects, is a fair criterion of the character of the teaching.

The prizes awarded for physical training under the provisions of the Strathcona Trust for the past school-year were as follows:—

First—Mr. Horace Hurn, 2nd Division, Merritt Superior School.

Second—Miss Kathleen Lawrence, 10th Division, Kamloops Public School.

Third—Miss Margaret Wright, Louis Creek Public School.

In closing, I wish to thank the various teachers and members of School Boards throughout the inspectorate for the many courtesies extended to me, and for their hearty co-operation in the work of inspection and in the other duties connected with my work. As my knowledge of conditions in the territory over which I travel increases, the more fully I realize the difficulties that confront the settlers in new districts in providing educational facilities for their children, and the more I appreciate their whole-hearted efforts to facilitate in every way the work of the Department in the establishment and administration of the schools.

I have, etc.,

A. F. Matthews,

Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 10.

Kelowna, B.C., August 23rd, 1921.

S. J. Willis, Esq.,

Superintendent of Education, Victoria, B.C.

Sir,—I beg to submit herewith my annual report in respect of the public schools of Inspectorate No. 10 for the school-year ended June 30th, 1921.

A steady and considerable growth has been evidenced during the past few years. In 1919 there were 129 teachers employed in the various schools of this inspectorate; in 1920 there were 146; and for the present year 160. Since last September the schools at Bear Creek and Woodville Road have been reopened and a new school established at Trinity Valley; additional divisions have been in operation at Armstrong, Vernon, Woods Lake, Kelowna, East Kelowna, South Okanagan, Summerland, Penticton, Naramata, Princeton, and Copper Mountain. In addition, schools have been authorized and will be in operation during the coming term at Trinity Creek, Ewing's Landing, Hillcrest, and Oliver. During the past year the division of teachers among the various districts was as follows:—

	Schools.	Teachers.
City municipality districts	11	54
Rural municipality districts	8	31
Rural schools	21	42
Assisted schools	32	33
Totals	72	160

To accommodate the increased school population extensive building operations have been necessary. At Armstrong and Penticton large and fully modern school-houses have been erected;

at Vernon, through the generosity of the Provincial Government, the old Court-house is being converted into a very satisfactory four-room school; two-room buildings were completed at Woods Lake and at Copper Mountain; while arrangements have been completed for additions to the existing buildings at Oyama, East Kelowna, and Westbank, and for a two-room school at Oliver. Despite these very considerable improvements, the problem of accommodation is a critical one; in most of the urban districts every available class-room will be filled in September and a number of rural schools will be materially overcrowded.

The provision of high-school facilities in rural districts continues to receive a good deal of attention, both from parents who are directly concerned and from public-spirited ratepayers who are interested in the development of their local districts. With this end in view, superior schools have been established at Westbank Townsite and at Oyama, while similar arrangements are under consideration at other points.

In general, conscientious, painstaking, and reasonably efficient class-room work has been the rule. More frequently than in previous years extremes of good and of bad have been met, but this is undoubtedly a coincidence rather than due to any specific reason. In most of the graded schools good results have been secured, while a similar statement is true of a few of the smaller schools, which have been fortunate enough to retain proven teachers or to secure unusually capable ones. The constant migration of rural teachers, referred to in earlier reports, still continues, as is evidenced by the presence, during the past year, in the ninety-seven class-rooms of the ungraded and semi-graded schools, of 121 teachers, of whom only twenty-two were in these schools prior to September 1st last. The salary paid by most of these schools has been at least $1,200 per annum, yet teachers remain no longer than when the remuneration was much less—a clear indication that the appeal of the graded school does not lie solely or chiefly in dollars and cents.

I have, etc.,
A. R. LORD,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 11.

REVELSTOKE, B.C., August 15th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit herewith the following report on the public schools of Inspectorate No. 11 for the school-year ended June 30th, 1921:—

During the year the following assisted schools were opened: Bellevue, across the Columbia River from Burtondale; Birchbank, a few miles north of Trail; Carroll's Landing, about midway between Burtondale and Arrow Park, East; Champion Creek, about 8 miles south of Brilliant; Norwegian Creek, between Boundary Falls and the International Boundary-line; and Spencer, a few miles to the south and west of Grand Forks. The school at Parson, in the Upper Columbia Valley, was reopened, and an additional division was opened in each of the following schools: Brilliant, Grand Forks, and Trail Central. The schools at Berrydale and Moberly were not in operation during the year, and the school at Phoenix has been discontinued owing to the cessation of mining operations at that point. Two divisions were closed out of the Revelstoke schools, which are now being operated as one school unit under a supervising principal, and one division of the Rossland School was also closed during the entire year. In all, there were ninety-five schools in operation in this inspectorate during the school-year, with a total staff of 154 teachers, a net increase over last year of three schools and two teachers. Of these totals, seven were graded city schools with a staff of fifty-six teachers, three were graded rural schools with a staff of nine teachers, two were graded assisted schools with a staff of six teachers, eleven were ungraded rural schools, and the remaining seventy-two were ungraded assisted schools.

For the first time in three years there was comparatively little interruption due to sickness, and a correspondingly higher standard of attainment was thus made possible. A marked improvement in the results of the Entrance Examinations can also be noted, particularly in the case of candidates presented by the ungraded schools.

The percentage of change in the teaching staff, while not so great as last year, is still considerably above the average, and it is sincerely to be hoped that this veritable menace to efficiency may speedily be reduced to a more reasonable minimum.

I have, etc.,
A. E. MILLER,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 12.

NELSON, B.C., September 20th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit a report on the public schools of Inspectorate No. 12 for the year 1920–21.

The assisted schools of Elk Prairie, Standard Mine, and Nine-mile Creek did not reopen after the summer vacation owing to an insufficient number of pupils, and during the year one division of the Moyie School was closed from the same cause.

In Cranbrook, Fernie, Bull River Bridge, Camp Lister, Corbin, Salmo, and Wardner an additional room was added to each school to care for the increasing school population. After being closed for two years the Gray Creek School was reopened and new schools were established at Passmore and Three Forks. One hundred and seventy-five class-rooms were in operation during the year.

Owing to the large number of schools and the many special trips made to different parts of the inspectorate it was not possible for me to make two visits to each class-room, but all classes in continuous operation throughout the year received one inspection, while a few were given a second visit.

The extension of the boundaries of Nelson City to include Fairview brought the Hume School under the control of the Nelson Board. A careful survey of the results of the June Entrance Examinations would seem to indicate that the work being done in the public schools of this inspectorate will compare favourably with anything in the Province. With two or three exceptions, the rural and assisted schools made a very creditable showing.

In many of the schools careful and conscientious work is being done. Wherever there is evidence of thoughtful preparation of the work by the teacher the standing of the school is almost invariably satisfactory. Too frequently arithmetic is merely a "seat-work" subject, and insufficient mental drill in combinations, separations, and multiplication tables is resulting in the "counting habit." Many teachers complain of the untidiness of the work of the class, but, at the same time, they accept the untidy work. The brighter pupils often get the larger share of attention. Teachers should remember that our schools are not intended to produce intellectual phenomena and that the aim should be to assist the slower pupils to a reasonable average of attainment.

The bridging of the gulf between the standards of the average city school and those of the average rural school is a problem which demands the most careful consideration. The successful rural teacher finds little difficulty in obtaining a position in a graded city school at a larger remuneration than she would receive in the country.

From the standpoint of national development, there is no other single force in the Province which determines to such a degree the success of the future as the teaching staff of the elementary and secondary schools, and no other influence which should tend to so great an extent to mould a sane public opinion.

The responsibility of the teacher is great—the remuneration should be in proportion to the responsibility. A few teachers are not worth their salary; the majority are worth more than they receive.

In many of the rural schools there has been a decided improvement in comfort and equipment and seldom have I found School Boards who were not prepared to recommend to their ratepayers an increased budget for the coming year.

I have, etc.,
E. G. DANIELS,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 13.

PRINCE RUPERT, B.C., August 31st, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I have the honour to submit the following report on the public schools of Inspectorate No. 13 for the year ended June 30th, 1921:—

During this year the following assisted schools were opened: Firvale, 30 miles up the Bella Coola Valley; Lawn Hill, on the east coast of Graham Island, Queen Charlotte; Hanall, 3 miles east of Usk; Evelyn, 9 miles west of Smithers; Glentanna and Driftwood Creek, about 8 miles north-west of Smithers; Topley, 32 miles west of Burns Lake; Decker Lake, 5 miles west of Burns Lake; and Tchesinkut Lake, between Burns Lake and Francois Lake. Round Lake and Buckley Bay Schools were reopened, and an additional room was opened in each of the following schools: Ocean Falls, Granby Bay, Prince Rupert, Kitsumgallum, Usk, and Smithers. The schools at Metlakatla and Inverness were not in operation and Skidegate was closed before the end of the year. In all, there was a net increase of thirteen teachers over the previous year.

The following schools have been established and will be in operation next term: Hunter Island, near Bella Bella; Oona River, on Porcher Island; Kitwanga and Quick, on the Grand Trunk Pacific; and Uncha Valley and Tatalrose, on the south side of Francois Lake. A large percentage of this increase has been in the Omineca District, where the number of teachers this next term will be almost 100 per cent. greater than when I took over the district two years ago.

The new school buildings at Granby Bay and Telkwa were ready for occupation at the beginning of the year and were found both creditable and comfortable. Prince Rupert has ready for use this fall a modern twelve-room brick school which will compare favourably with any other school in the Province. This will relieve the congestion in this city which has been apparent for several years. A three-room addition has been made to the Kitsumgallum School and two rooms are being added to the Smithers School.

Entrance Examinations were held at seventeen centres, where 109 candidates presented themselves. Of these, 58 pupils, or 53 per cent., were successful. The number of candidates this year marks an increase of 147 per cent. over that of last year, when forty-four candidates wrote the examination. In addition, forty pupils of Prince Rupert schools were granted promotion to high schools upon recommendation of the principal. This is also an increase of thirty-three per cent. over the previous year.

In view of this increasing number of pupils passing the Entrance Examination, it is gratifying to note that a superior school has been established at Smithers and that Granby Bay and Ocean Falls are taking steps to provide high-school education for pupils who have completed the Course of Studies of the elementary school. The new regulation pertaining to the number of pupils required for the establishment of high and superior schools effectually meets the demand in this district for high-school privileges.

The Governor-General's medal for the highest mark in the Entrance Examination in the Inspectorial Districts of Prince Rupert and Prince George was won by Reid Lewis McLennan, Borden Street School, Prince Rupert.

Prizes awarded under the provisions of the Strathcona Trust were as follows:—

First—Miss Lena Wolfenden, 2nd Division, Ocean Falls.
Second—Miss A. M. MacKinnon, 4th Division, Prince Rupert.
Third—Miss Jessie Rothwell, 3rd Division, Prince Rupert.

Reports upon the schools individually have been forwarded to you from time to time, so further comment would be superfluous, except to say that on the whole the work of the teachers and the spirit in which it was undertaken in the majority of schools was highly commendable and satisfactory.

I have, etc.,
J. M. PATERSON,
Inspector of Schools.

PUBLIC SCHOOLS—INSPECTORATE No. 14.

PRINCE GEORGE, B.C., August 12th, 1921.

S. J. Wilis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the following report on the schools of Inspectorate No. 14 for the school-year ended June 30th, 1921:—

The boundaries of Inspectorate No. 14 remain unchanged from last year. The inspectorate comprises the schools in the Grand Trunk Railway Belt east of Endako; those in the Cariboo and Lillooet Districts as far south as the 100-Mile House; those in the Canadian Northern Railway Belt as far south as Blue River; and those in the Peace River District.

During the past year there has been a steady growth in the school population throughout the inspectorate. Schools were opened for the first time at Aleza Lake, Canim Lake, Hulatt, Orange Valley, Miocene, Penny, Swan Lake (Peace River), Tate Creek (Peace River), Taylor's Flats (Peace River), and Williams Lake. New schools were authorized and should soon be in operation at Bear Head, Meadowdale, Stone Creek, Stuart Station, and Willowvale. Additional teachers were appointed to the Prince George and Vanderhoof staffs and the school at Braeside was reopened. The assisted schools at Hartley, Rose Valley, and Stuart River remained closed throughout the year.

Owing to the large number of new and widely scattered settlements springing up in this northern section of the Province my work is largely of a pioneer nature. Class-room inspection is perhaps the smaller part of my work, a good portion of my time being taken up with organization duties. Practically all the schools, however, have received at least two visits during the year.

On the whole the general standing of the schools within this inspectorate is not of a high order. This condition is due in no small measure to the fact that the teachers change so frequently that good results are impossible. In many of the schools a new teacher, very often a beginner, appears each year, and frequently a change of teacher is effected at the end of each terms. A number of the schools in these northern parts are handicapped year after year by the employment of unskilled, temporary certificated teachers, who have little knowledge of our courses, standards, and methods. Inability to organize the work of their class-rooms constitutes the chief criticism of the teachers in the one-room schools of this inspectorate. Although many of the teachers present the individual subjects comparatively well, they are unable to prepare a well-balanced time-table in which each subject in each of the classes receives due consideration.

Although the school accommodation in many of the districts is as yet far from satisfactory, a gradual improvement is being effected. Nearly half of the districts are now voting assessments for the purpose of providing funds with which to operate the schools and improve school property. A number of the assisted districts have recently erected very commendable buildings, and in one of them, Willow River, a comfortable teacher's residence has been provided. At Vanderhoof a modern four-room building is in course of erection, and an eight-room building is being provided for in the Prince George District.

During the past year the teachers within this inspectorate have made a greater effort than heretofore to teach systematically the prescribed courses in physical training. In some of the schools the results in this department of school-work have been very commendable. The prizes for excellence in physical training were awarded as follows:—

First—Miss E. Milligan, 5th Division, Prince George School.
Second—Miss Drina Fraser, Fort Fraser School.
Third—Miss Marjorie Baker, 2nd Division, McBride School.

I have, etc.,
G. H. GOWER,
Inspector of Schools.

REPORT OF MUNICIPAL INSPECTORS.

VANCOUVER CITY SCHOOLS.

VANCOUVER, B.C., August 31st, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the following report on the public schools and high schools of this city for the school-year ending June 30th, 1921:—

STUDENTS AND TEACHING STAFF.

During the year there was an increase of 978 students, but owing to the lack of class-room accommodation the net increase in the teaching forces was only fifteen. The changes in the various staffs are indicated in the following summary:—

Public schools			from 409 to 416
General classes	from 392	to 399	
Special classes	„ 12	„ 16	
School for the Deaf (taken over by Government)	„ 4	„ 0	
School for the Blind	„ 1	„ 1	
High schools			„ 69 „ 78
General Course	from 46	to 51	
Commercial Course	„ 11	„ 11	
Boys' Technical Course	„ 9	„ 13	
Home Economics Course	„ 3	„ 3	
Manual training			„ 23 „ 18*
Domestic science			„ 12 „ 13
Special instructors			„ 6 „ 9
Total			from 519 to 534

* Last year five instructors working in the Technical Department of King Edward High School were counted in the manual-training group. Since the opening of the Technical School they are grouped with other Technical School teachers. The decrease at this point is therefore only an apparent one.

SCHOOL ACCOMMODATION.

In my report for the school-year 1919–20 I spoke of the unsatisfactory results obtained in the primary grades of the public schools from part-time tuition made necessary by a lack of adequate class-room accommodation. For the first term of the past year an attempt was made to improve conditions. Our schools were reorganized with an average enrolment of approximately forty-five per class instead of forty as formerly. This resulted in a reduction of fourteen in the teaching staff and reduced the number of part-time classes from thirty-four to two. It led, however, to overcrowded class-rooms, making effective teaching in many instances extremely difficult—in others impossible. In October, when the enrolment was 17,993, there were seventy-eight class-rooms with an enrolment of nearly fifty and twenty-four others with fifty or more each. Notwithstanding these conditions, which were well known to the public, the school money by-laws for amounts totalling $241,000, submitted to the ratepayers in January, were defeated. Consequently, when 1,077 more Receiving-class pupils were enrolled in February, to overcrowded classes was added part-time tuition—thirty-four part-time classes having to be organized for the remainder of the year.

The presence of these two evils, part-time tuition and overcrowded classes, for the last term of the year, and the conviction that money could not be secured by submitting money by-laws to the ratepayers, led the Board to decide "that hereafter no 6-year-old children will be admitted to the schools unless money be provided to erect more class-rooms in which to accommodate them." This drastic, though necessary, resolution brought a measure of temporary relief. An agreement

was reached between the Board and the City Council permitting the former to spend a limited amount of money for school-construction if the amount expended be taken out of the Board's revenue for the year. This will help for a time, but it is by no means a satisfactory solution. By erecting an inexpensive eight-room school on the Strathcona grounds from materials obtained largely from the old school, and providing eighteen rooms in very inexpensive one- or two-room frame buildings in districts where they are needed, we expect to have class-rooms for all public-school pupils in September, though some classes may be overcrowded. February of the coming year, however, will again find us with no class-rooms for about 1,000 pupils. Using for the erection of new class-rooms moneys urgently needed to keep existing buildings in proper repair will in the end prove an expensive expedient. The sooner, therefore, we have legislation making it possible for School Boards to obtain sufficient funds to provide proper class-rooms for an ever-increasing school population, and at the same time keep existing buildings in proper repair, the better.

The congestion in the high schools was relieved by the opening of the Vancouver Technical School on March 1st, 1921, in what was formerly the Labour Temple. This building, purchased and remodelled by the Provincial Government and rented to the Board as a technical school, has been well equipped and will meet the needs of technical students for a few years. The opening of it has also left rooms, vacated by the technical students at King Edward School, for additional high-school students in the coming year.

Survey of Sewing in the Grades.

There has been practically no supervision of sewing in the Vancouver schools since 1915; and, as was to be expected, the work has greatly suffered. From a survey made by one of our most competent domestic-science teachers early in the year, it was found that not more than 20 per cent. of the teaching could be regarded as satisfactory. This represented a great loss, as there were about sixty teachers and over 1,000 girls who should be spending profitably one half-day a week at sewing. The Board has consequently appointed an expert in needlework to be a teacher of the many lady teachers who enter our schools unprepared to teach sewing.

Physical Culture for High-school Girls.

Another forward step taken during the year was the appointment of an instructress in physical culture for high-school girls. The work done along this line already has abundantly demonstrated its importance. It is to be regretted, however, that the lack of proper gymnasium facilities will make it impossible to extend this work for some time to include all high-school girls as it should.

Extension of Special Class-work.

Notwithstanding the difficulties experienced in finding additional class-room accommodation, four more special classes were opened. It has been found that the removal of special-class children from the ordinary classes makes it possible to increase the size of the latter and do better work than could be done in smaller classes handicapped by the presence of subnormal pupils. The work now being done in Vancouver in the special classes is conceded by experts in such work to be of a very high order. I cannot speak too highly of the unfailing devotion to duty of the members of the staff who are carrying on this important but trying work.

The Work of Supervisors.

The supervision of drawing, music, physical training and cadet-work, primary work and special-class work was carried on throughout the year by supervisors giving full time to supervision.

In manual training and home economics, however, the supervisors taught the greater part of their time in high schools. The results, in consequence, were not as satisfactory as supervisors and teachers could wish. This was particularly noticeable in the Home Economics Department, where there was almost an entirely new staff of teachers, many of whom were new to the work in this Province. I am pleased to report that the present School Board, recognizing this condition, is now prepared to appoint a supervisor to devote full time to the work.

MEDICAL INSPECTION.

The work of medical inspection was energetically carried on by Dr. Robert Wightman and his staff of two lady doctors and eight nurses. The value of the work done in this department, not only in the immediate prevention of disease but in the education of children, parents, and the public generally along hygienic lines, cannot be overestimated. The campaign being waged by the Medical Department of our schools to bring every school-child up to normal physically is meeting with enthusiastic public support.

THE DENTAL CLINICS.

After seven years of absolutely free dental treatment for children of parents with small incomes, it was found that the most of such cases were completed. Last year the work was extended to include the children of parents with moderate incomes who could not pay ordinary dental fees and would not accept free treatment. Many children of such parents are now cared for in the school clinics on the payment of a nominal fee.

NIGHT-SCHOOLS.

A survey of the year's work would not be complete without reference to the night-schools. The work in these was extended to include Third-year Electrical Engineering, Cabinetmaking, Plumbing, Ladies' Tailoring, Salesmanship, Science Course for Teachers, and Mathematics for Teachers. Forty-two teachers were employed and the enrolment of students reached a total of 1,686, distributed as follows:—

Continuation classes	128
Art and Show-card Work	107
Modern Languages	52
Music	158
Engineering	209
Carpentry and Cabinetmaking	43
Electrical Engineering	195
Commercial Courses	420
Plumbing	70
Elocution and Speaking	63
Short-story Writing	20
Teachers' Courses	17
Domestic Science	204

The attendance of the students and the interest taken by them in their classes was most encouraging.

SALARIES.

No great changes were made in the salary schedule in January, 1921. Salaries ranging from $1,800 to $3,200 were increased but little; those ranging from $1,080 to $1,600 were considerably increased, the Board considering the teachers drawing such salaries poorly paid. For the first time, too, in Vancouver, the Board, finding it impossible to secure the services of young men for salaries paid to ladies, made a special salary schedule for male assistants in the public schools. This has already had the desired effect of increasing the number of young men teachers; but the indications are that better salaries still will have to be offered if a sufficient number of young men of ability are to be attracted to and retained in the teaching profession. Though the present salary schedule seems in the main fairly satisfactory, the experience of the past few months indicates a few further changes which seem desirable. I trust these will be made in the coming year.

SCHOOL SPORTS AND ATHLETICS.

The importance of school sports is being more and more recognized by our teachers and an ever-increasing number of them are interesting themselves in the physical well-being of the children. In the opening term of the past year over 100 of our teachers spent time and money to qualify themselves the better to carry on the work of physical training in their classes. This work must necessarily make considerable inroads on the time for study, which is now none too long; but it is valuable and has come to stay. May we not look forward to a six-hour school-day in the not-distant future, with one-sixth of it devoted to the physical needs of the children under

the direction of teachers well qualified for such work? It would be a boon to both teachers and pupils.

GENERAL OBSERVATIONS.

Notwithstanding the inconveniences experienced by many engaged in the schools of Vancouver during the past year, school-work was never carried on more enthusiastically. The manner in which teachers strove to rise superior to adverse circumstances and the endeavours of pupils and parents to meet philosophically trying situations rendered the administration of the schools much easier than it otherwise would have been. The active interest in our schools of influential public bodies was never greater, never more needed, and never more highly appreciated. While many clubs and associations might be mentioned in this connection, the Parent-Teacher Associations are deserving of special commendation. Their efforts on behalf of the schools have been increasing and varied, serving as a stimulus to school workers in all departments.

I am pleased to report also that for the year just closed our school-life has been characterized by a sane, unostentatious patriotism which augurs well for the future. This patriotism possibly found its highest expression on June 23rd, when nearly 6,000 pupils and teachers met in Stanley Park to celebrate the fiftieth anniversary of British Columbia's entry into Confederation.

In closing, I wish to express my appreciation of the continued kindly relations that have existed between the Education Department and the Vancouver School Board.

I have, etc.,

J. S. GORDON,

Municipal Inspector of Schools.

PROVINCIAL NORMAL SCHOOLS.

VANCOUVER PROVINCIAL NORMAL SCHOOL.

VANCOUVER, B.C., September 12th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the report of the work of the Provincial Normal School, Vancouver, for the school-year ended June, 1921.

AUTUMN SESSION.

The session opened on September 7th, 1920. The enrolment for the session was 239. Of this number, 48 were taking the Advanced Course and 191 the Preliminary. During the session 3 of the Preliminary class withdrew, and the session closed with an attendance of 48 Advanced and 188 Preliminary students. To 46 of the Advanced class Advanced diplomas were granted, while the two remaining members of the class were granted Preliminary diplomas.

Diplomas were granted to 172 of the Preliminary class, 11 were allowed to enter the advanced session conditionally, and 5 failed.

The opening of the session in September saw several changes on the teaching staff. Mr. Wm. Burns retired from the position of principal at the end of August, 1920. For twenty years he had served as principal of the Normal School. Hundreds of teachers throughout the Province will bear testimony to his untiring and conscientious work in the Normal School. To them his life and work will always be an inspiration. We were pleased to have Mr. Burns deliver one lecture a week to the Advanced class until the close of the session in December.

Mr. A. E. C. Martin joined the staff in September. Mr. Martin brought to his work in the Normal School a ripe experience in public- and high-school work in the Province.

From September to March Miss Coney was on leave in England. While there she took a Course in Eurythmics and visited many of the English training-schools. During her absence Miss Ida Morris filled the position of music instructress most satisfactorily.

ADVANCED SESSION.

For the first time in several years the Advanced Course only was conducted during the winter session. The change was most welcome. While occasionally good students entered in January for the Preliminary Course, this was the exception. Our Preliminary class in January was, as a rule, composed largely of our own failures, together with failures from the University.

The total enrolment for the advanced session was 182. Of the 11 who passed conditionally in December, 10 returned in January. One of these withdrew, and in February the remaining 9 were granted Preliminary diplomas. Seven withdrew during the session. Thus we finished with an enrolment of 174. At the close of the session 169 were granted Advanced diplomas and 5 failed.

Work for the next year was apportioned as follows: The Principal—Grammar, class-room management, registers and reports, psychology. Mr. Murphy—History and geography. Mr. Weston—Drawing and painting. Mr. MacLean—Writing, nature-study, school-gardening, hygiene. Mr. MacIntosh—Reading, language, composition, literature, spelling. Mr. Martin—Arithmetic, history of education. Miss Burpee—Primary work. Miss Coney—Music. Sergt.-Major Instructor Wallace—Physical training.

All students in attendance since September, with the exception of two, qualified for the certificate of physical training. I consider that it would be greatly to the advantage of our students if the Course in Physical Training could be continued throughout both preliminary and advanced sessions. It does not seem in the best interests of our students to crowd the entire Course of Training into twelve or fifteen weeks. We shall be very pleased if, during the ensuing year, each of the Normal Schools of this Province has an instructor for this very important branch of training.

During the year our students have had, on an average, thirty-five lessons to teach in the practice schools. I wish to take this opportunity to thank the teachers of the Model and Cecil

Rhodes for their very kindly assistance in this most important department of the training of our students.

While our students have given close attention to their professional duties, the literary, athletic, and social sides of Normal School life have not been overlooked. The Literary Society has presented many entertaining and instructive programmes during the year. The Athletic Society has fostered basket-ball, badminton, tennis, hockey, and indoor baseball. The usual autumn and spring dances, school parties, and picnics have served to develop among the students the best school spirit.

I have, etc.,
D. M. ROBINSON,
Principal.

VICTORIA PROVINCIAL NORMAL SCHOOL.

VICTORIA, B.C., September 26th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I have the honour to submit the following report on the work of the Provincial Normal School at Victoria during the school-year which ended June 30th, 1921:—

The number in attendance was:—

	Sept. to Dec., 1920.	Jan. to May, 1921.
For the Advanced Course	14	89
For the Preliminary Course	101	..
Totals	115	89
Number that withdrew during the session	1	2
Number that failed to qualify	2	5
Number awarded diplomas	112	82
Totals	115	89

From this table it may be noted that the plan of conducting Advanced and Preliminary Courses simultaneously was discontinued at the end of the year 1920. In this the Department of Education has pursued a most desirable policy. The energy of the Normal School instructors may now be concentrated upon preliminary work in the fall session and upon the more advanced work during the spring session. This will result in more thoroughly trained teachers and hence more efficient work in the elementary schools of the Province.

The personnel of the staff underwent changes during the year. Mr. E. Howard Russell, Professor of Mathematics in the Victoria Arts College, took charge of the instruction in music. Mr. Russell's ability in this work is so well known that comment is unnecessary. Miss A. M. Macfarlane, following the resignation of Miss Lexa Denne in July, 1920, was appointed to the Department of Household Economics. Miss Macfarlane, who is a graduate of Macdonald College, St. Anne de Bellevue, Quebec, had given three years of excellent service in the Domestic Science Departments of the common and high schools of the Okanagan Valley. The high standard of the work she has done during the year has shown the wisdom of the Department of Education in promoting her to the Faculty of this school. In July, 1920, Miss Florence N. Maclean was appointed Secretary and Librarian. Miss Maclean, who is a graduate of this school, is a fully certificated teacher. This qualification, combined with her superior ability in secretarial work, has uniquely fitted her for her duties. The apportionment of work among the other members of the staff has remained unchanged.

The generous policy inaugurated by the Department of Education of assisting members of the staff to attend summer sessions at leading universities was put into effect in this school during the summer of 1920, when Miss Kate Scanlan, Principal of the Model School Department, attended the summer session of the University of California at Los Angeles. New features that

have appeared in the already excellent work of this teacher provide but one more instance of proof that a true teacher is ever a learner and should be given opportunity periodically to become a learner.

It gives me pleasure to report that it was the unanimous opinion of the Faculty that the students who were trained in this institution during the year 1920–21 were, with few exceptions, admirably adapted to the work of the teaching. Not only was the work of the year encouraging and pleasant, but it was with a feeling of more than usual confidence that diplomas were granted to these young teachers permitting them to assume the fuller responsibilities of actual service. Nevertheless, in spite of the natural aptitude and happy temperament of these young teachers-in-training, it was again borne in upon those in charge of their training that a more extensive and a more thorough groundwork is necessary in knowledge of the subjects that they are going to teach before a professional training in the art of teaching those subjects can be adequately given. In several of these subjects they have received little, if any, instruction during their high-school course. Hence the knowledge they have acquired in the elementary school is assumed to be a sufficient basis for their professional training. The one-year course of Normal School instruction is hardly long enough to provide both academic and professional training. Further, may I again urge that, with an ever-increasing number of graduates in Arts from our Provincial University, the demand for the establishment of a training course for high-school teachers is becoming imperative. Were such a course established, it would provide not only much-needed training, but it would prove to be an incentive that would turn more and more of these graduates into the teaching profession, and thereby tend to augment a supply that at present is inadequate to the demand.

I cannot conclude this report without once more expressing my thanks to the staffs of the Model School, the North Ward School, and the Bank Street School for their helpful co-operation in our work, and to all those citizens from outside our profession who by addressing our students from time to time afforded us inspiration.

I have, etc.,
D. L. MACLAURIN,
Principal.

TECHNICAL EDUCATION.

REPORT OF THE ORGANIZER.

VICTORIA, B.C., October 11th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the following report on manual training, domestic science, night-schools, and technical education for the year 1920–21:—

MANUAL TRAINING AND DOMESTIC SCIENCE.

It is very gratifying to report that an increasing interest in the above subjects is taken by school principals and teachers generally, as the complete success of the work depends in a great measure on the way the contents of these courses, which are inseparable from home-life, are linked up with kindred class-room studies.

The educational authorities have always maintained that manual-training and domestic-science centres must be an integral part of the school system, and that the activities in the workshops and cookery centres must emphasize the book lessons of the class-rooms, making them more realistic and thus firmly fixing them in the minds of the pupils. For these reasons it is satisfactory to know that there is a growing co-operation between the manual-training teachers and the school staff.

Owing to the conscientious work of the instructors, manual training is becoming firmly established throughout the Province. The men invariably display earnestness and enthusiasm in conducting their work, and with very few exceptions show a commendable desire to succeed. The fact that the Province of British Columbia has more manual-training instructors than any other Canadian Province except Ontario is conclusive proof that the subject has gained public confidence.

Thirteen men who wish to become manual-training instructors attended the summer-school training class held in the Vancouver Technical School during the summer holidays. The course of study is acknowledged by the Manual Training Teachers' Association to be of such a nature as will effectively equip men with the essentials for conducting the manual-training work in an elementary school centre. There was no difficulty in securing a class of school-boys of Third Reader Grade to attend a class in woodwork, and these beginners provided the practical teaching problems for the prospective manual instructors. This course will be followed by a series of classes held on Saturday afternoons, thus providing an opportunity to complete 700 hours' tuition, which is the number demanded of all candidates.

Twelve manual-training instructors from the elementary schools attended a summer school to participate in the training which would qualify them to teach in high schools. A reproduction of a group of metal repoussé on an adjoining page will show the standard of their work, and will illustrate to some extent the way in which craftsmanship and artistic taste combine to form an appreciation which may be worthily considered educational.

Classes in Manual Training and Domestic Science were conducted in the following cities: Armstrong, Chilliwack, Cranbrook, Kelowna, Mission, Nanaimo, New Westminster, Nelson, North Vancouver, Prince Rupert, Vancouver, Vernon, and Victoria. Similar classes were also held in the following municipalities: Burnaby, Chilliwack, Delta, Esquimalt, Maple Ridge, Penticton, Point Grey, Pitt Meadows, Rutland, Saanich, Summerland, and South Vancouver.

The following statistics for 1920–21 may be of interest and are here inserted:—

79 manual-training centres.	51 domestic-science centres.
62 instructors.	46 instructors.
8,349 elementary pupils attending.	6,362 elementary pupils attending.
1,436 high-school pupils.	1,326 high-school pupils.

DOMESTIC SCIENCE.

Although in this sphere of activity British Columbia again ranks next to Ontario in the number of teachers engaged, yet from the foregoing it will be observed that domestic science

has not made the same strides as the subject of manual training, nor has it obtained such a strong hold on public confidence. This is regrettable because the subject is one which is undoubtedly necessary and worthy of a prominent place in any educational system.

The work of training domestic-science teachers in Canada has been somewhat curtailed in recent years, and this, together with the growing demand for their services, has led to an increasing difficulty in obtaining instructors. The existing conditions would thus seem to make the organizing of a teachers' training class desirable. One practical way to do this would be to select school-teachers who have had previous domestic-science training and provide a Saturday morning class in either Vancouver or Victoria at which they could attend. Work taken at the Saturday morning classes, supplemented by courses taken at the summer school, would give an opportunity for very effective study to those who wish to become domestic-science teachers.

Such classes as are here alluded to have been and are being conducted for men who wish to become instructors of manual training. An Entrance Examination is held for admission and the Course of Study extends over 700 hours. Even the most sceptical must now concede that this manual-training scheme has been entirely successful; therefore a similar scheme might well be evolved for training domestic-science instructors, and the Province would thus have teachers at their command when required.

TECHNICAL COURSE.

Technical schools are now organized in the Cities of New Westminster, Vancouver, and Victoria. The Course of Study is composed of the following subjects: English, citizenship and economics, mathematics, mechanics, physics, electricity, drawing and design, woodwork, chemistry, sheet-metal work, forge-work, and machine-shop work.

The time-table in the Vancouver Technical School showed several classes with periods for practical work too short in duration, but a remedy was promised when the staff was increased. There seems to be a decided antipathy to lengthening the school-day in the technical schools. Where practical industrial machine-work is being carried on it is difficult to see why opposition should be made to a gradual increase in the school-day until the usual shop-day of eight hours is reached—viz., six hours for the first year, seven hours for the second, and eight hours for the third.

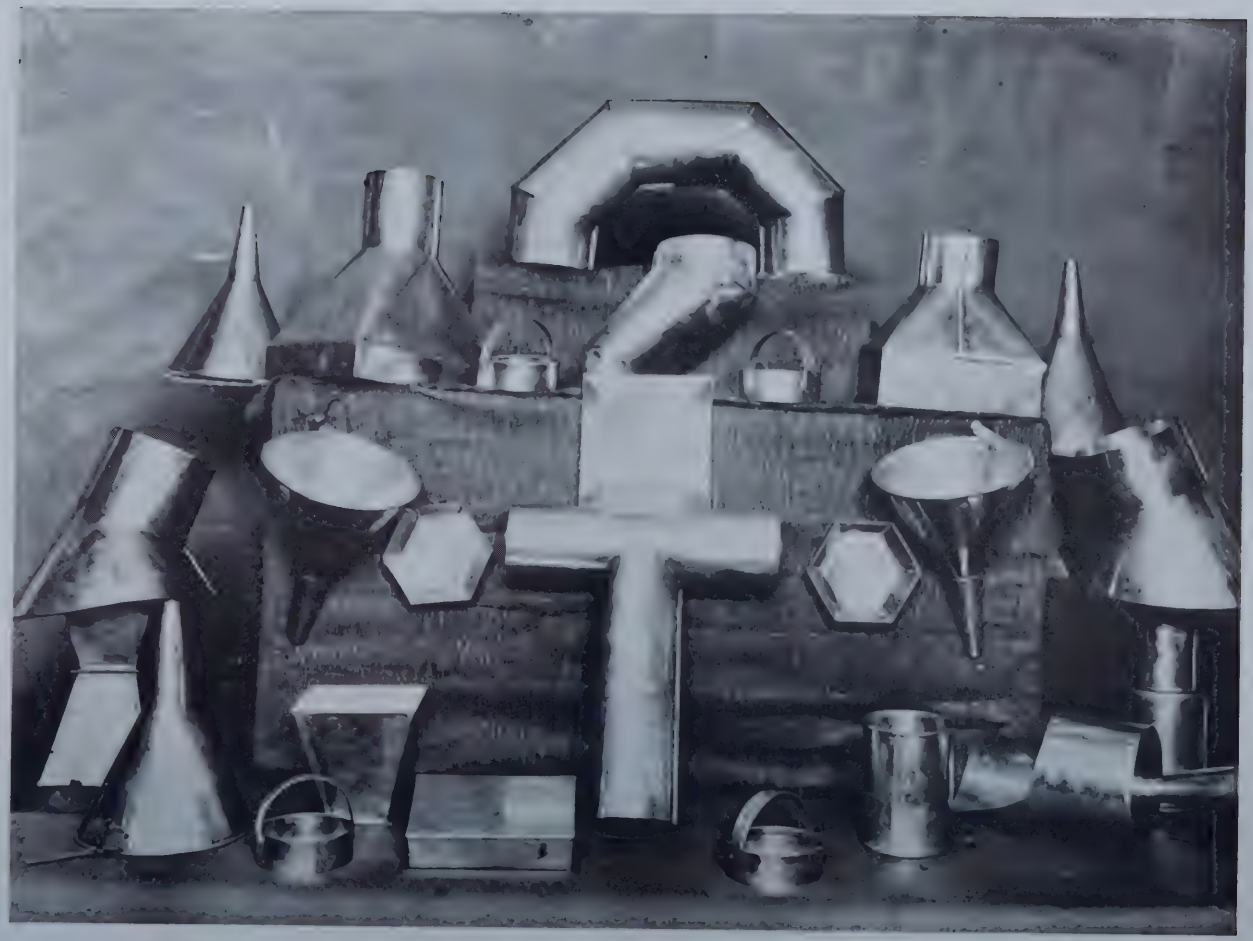
Vancouver City shows indications of being first in the Province to establish intensive trade courses attached to labour organizations in the work of apprenticeship training. Some development along this line may be looked for next year, but a great deal of organizing is required to be done before such can be accomplished. At present it is possible to obtain short courses in preparation for the examinations held in navigation and for stationary engineering. Sheet-metal workers and printers may be the next industrial people to become directly connected with the technical school. It yet remains for a school of design to be organized, and the importance of such an institution lies at the heart of all workmanship worthy of the name. The school of design should be closely associated to the technical school, as design and manufacturing should not be divorced.

New Westminster has now a well-equipped school and the coming year will show great advancement in the work of the pupils. The shops are roomy and all that could be desired for practical purposes.

The workshops in Victoria also are well fitted. The Course of Study for the first year is all that could be desired and the boys show remarkable aptitude in their work. The three cities named have shown commendable economy in establishing and equipping the necessary places wherein to train students along technical and industrial lines.

As a rule, boys who take the Technical Course aim at obtaining the technical leaving certificate, but those who wish to matriculate to the University of British Columbia are taught in a separate class, as it is necessary to rearrange the technical curriculum in the second and third years in order to replace certain subjects by those which give matriculation standing. Special technical papers in chemistry, physics, and practical mathematics are set for the Matriculation Examination, but an extra science subject, together with Latin or French, must be added in order to prepare for the requirements of the University.

Technical School, Vancouver.



Basic sheet-metal projects from the Manual Training class, Summer School.

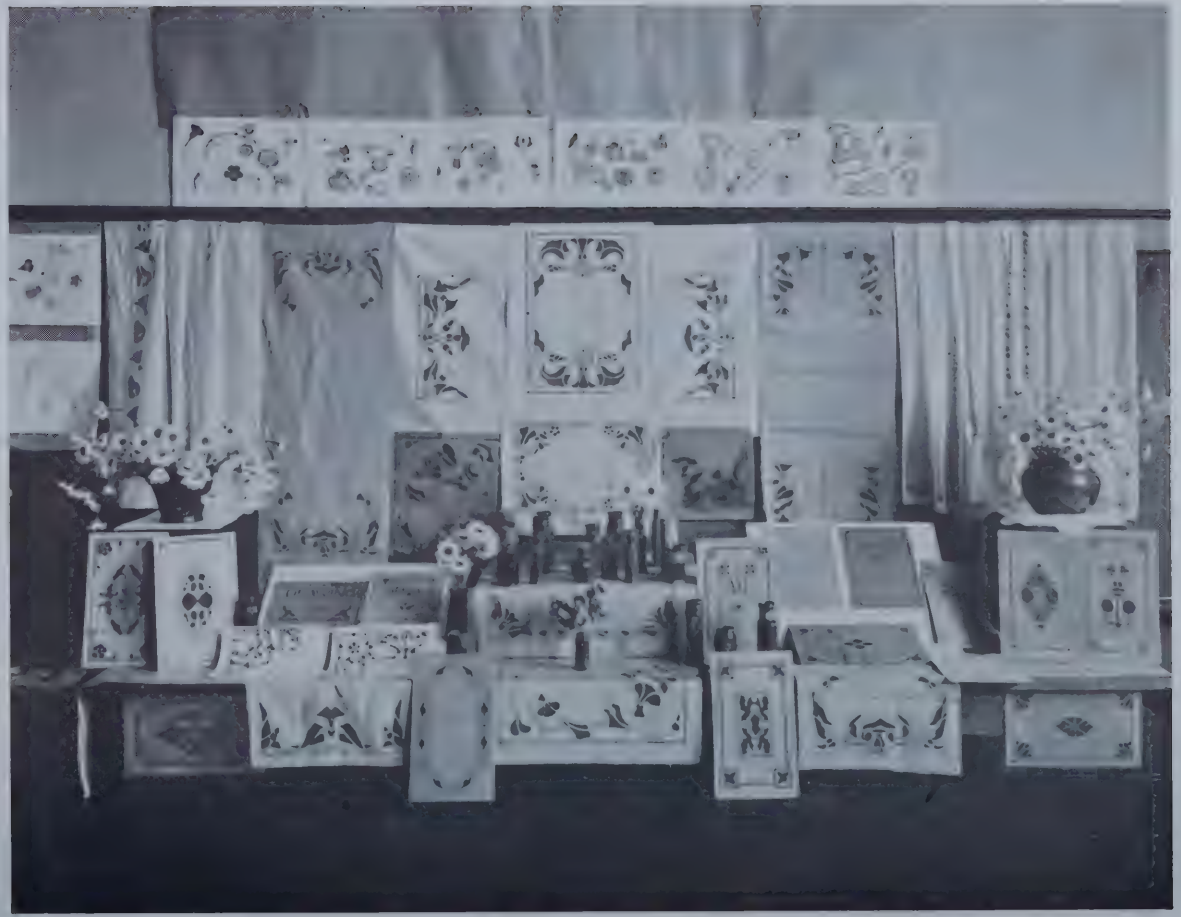
Advanced sheet-metal projects from the Manual Training class, Summer School.

Electrical laboratory, Vancouver Technical School.

Machine-shop, Vancouver Technical School.

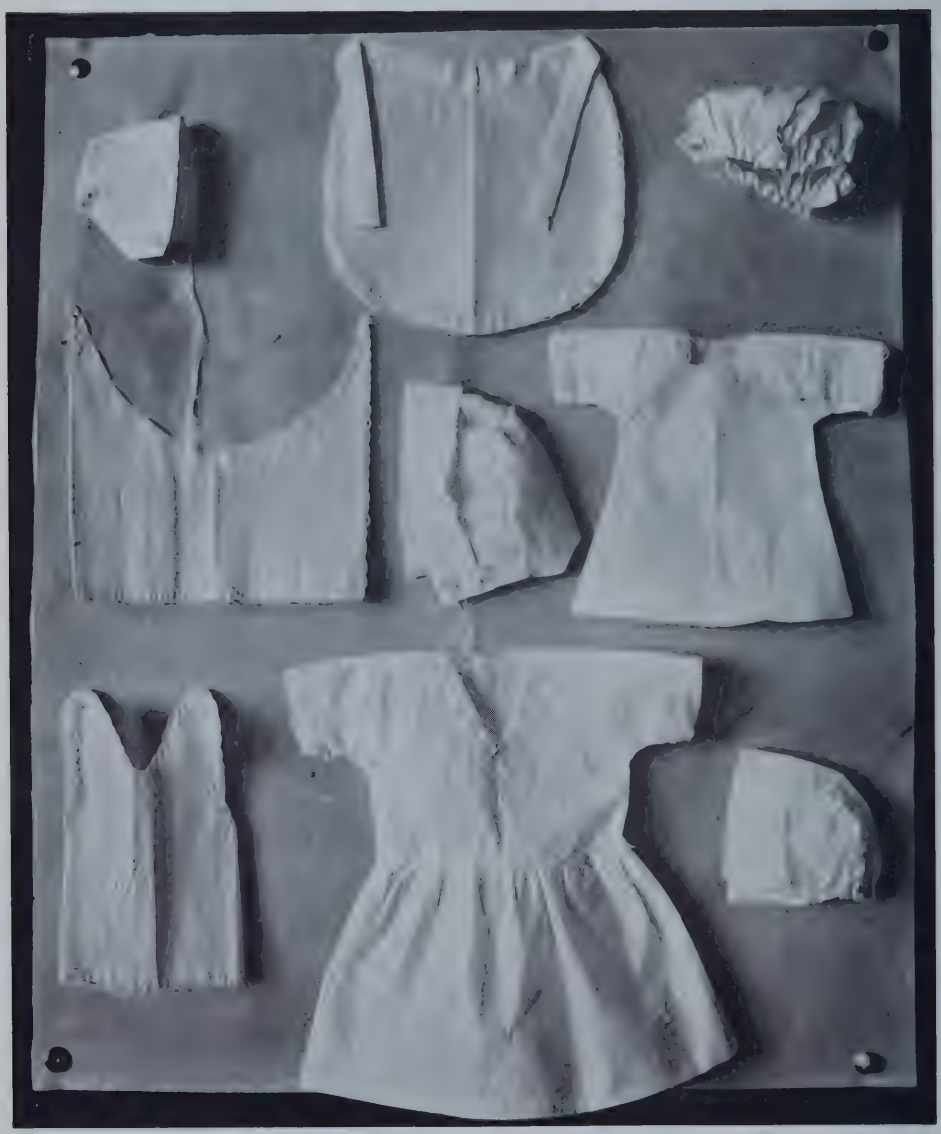
Sand-table projects from the Primary Grade class Summer School.

Hand-work from the Primary Grade class, Summer School.



Work in Applied Design from the High School Art-class, Summer School.

Rural manual-training centre, Chemainus, V.I.



Course in free pattern-cutting from the Home Economics class, Summer School.

The following expenditures for technical education were made for the year 1920–21:—

Administration	$ 4,573 66
Correspondence classes, etc.	3,511 71
Grants to night-schools, technical schools, commercial classes, etc.	97,231 24
Total	$105,316 61

Of this sum, 50 per cent. has been paid by the Dominion Government.

HOUSEHOLD SCIENCE COURSE.

In addition to the Technical Course for boys, a Household Science or Home-makers' Course for girls is organized in both Vancouver and New Westminster. The Household Science Course consists of the following subjects: English, civics, arithmetic and mensuration, algebra, chemistry, physics, physiology (including hygiene, child-welfare, and home-nursing), dietetics and cookery, needlework (garment-making and textiles), drawing, design, and household arts, vocal music and physical culture. As this course is admirably suited to those students who wish to become school-teachers, the graduates are readily accepted as students of the Normal Schools. The University authorities, however, do not accept any of the domestic-science subjects in lieu of others set at the ordinary Matriculation Examinations.

There has been a steady improvement in the work accomplished by the girls attending these classes, but lack of accommodation has heretofore handicapped the progress of the Vancouver pupils. Now that this has been remedied by the departure of the technical students to their own school, we must look for still further progress and for greater adherence to the subject-matter of the Course of Study as published by the Department of Education.

COMMERCIAL COURSES.

Commercial subjects also are included under the head of "Technical Education" and courses are conducted in ten cities in the Province. The figures appended will explain clearly the attendance at those classes and give some idea of the scope of the work:—

Place.	No. of Technical Students.	Commercial.	Home Economics.
New Westminster	68	113	16
Vancouver	287	386	66
Victoria	88	168	..
Kamloops	...	26	..
Ladysmith	...	19	..
North Vancouver	...	48	..
Nelson	...	33	..
Point Grey	...	28	..
Revelstoke	...	27	..
South Vancouver	...	68	..
Totals	443	916	82

NIGHT-SCHOOLS.

Night-schools were conducted in twenty-one cities and municipalities in the Province, with an attendance of 3,197 students. The names of these places with the number of students in attendance are as follows:—

Place.	Students.	Courses of Study.
Bevan	19	2
Chilliwack	45	6
Coal Creek	10	1
Colwood	11	1
Duncan	77	3
Chemanius	15	1
Granby Bay	221	10
Happy Valley	16	1
Carried forward	414	..

Place.	Students.	Courses of Study.
Brought forward	414	..
Merritt	28	3
Michel	17	2
Mission	76	5
Metchosin	13	1
Nanaimo	42	6
New Westminster	107	8
North Vancouver	86	6
Revelstoke	60	3
Saanich	87	3
South Vancouver	261	8
Thrums	10	1
Vancouver	1,436	29
Victoria	564	21
Total	3,201	..

The Course of Study embraces the following subjects: English, French, Spanish, journalism, book-keeping, typewriting, stenography, accounting, economics, salesmanship, draughting and machine construction, mathematics, mechanical and steam engineering, building construction, carpentry and joinery, cabinetmaking, naval architecture, navigation, electrical engineering, telegraphy, drawing and design, dressmaking, millinery, cookery, music (choral and orchestral).

In last year's report attention was called to the importance of appointing advisory committees to assist school trustees in directing night-school classes in trade subjects to the best advantage. So far, no such step has been taken by the Boards conducting technical work in this Province, and co-operative effort between manufacturers and educators is thus weakened. The system of calling in assistance from men directly connected with the industries concerned is one which is universal in character and is recognized as responsible for the best results.

Correspondence Classes in Coal-mining and Mine-surveying.

Success continues to attend the above classes, with an enrolment of 135 students. When, in addition, however, to receiving instruction by correspondence, a student enrols in a night-school and obtains the assistance of a thoroughly qualified instructor as a tutor, success is doubly assured. Experience has proven conclusively that this tutorial and correspondence method is the only satisfactory way of dealing with classes composed of men who work on the three-shift system. The Canadian Collieries (Dunsmuir), Limited, and the Canadian Western Fuel Company, Limited, have shown confidence in the correspondence courses by enrolling and paying fees for several boys in their employment. This gracious act was much appreciated by twenty-eight pupils employed by the former company and sixteen pupils from the latter. The preliminary fundamental courses for boys and young men between the ages of 15 and 23 are of primary importance, because it is not until they reach the latter age that they are permitted to sit for their first examination.

When, however, young mine-workers pursue their studies each year after leaving school, no great difficulty need be found to prevent them passing successfully the Government examinations to qualify as shotlighters, overmen, or even mine managers. It is interesting to know that at the May examinations the only first-class mine manager's certificate awarded was obtained by a student of the Correspondence School.

Lessons by Correspondence to Children who live in Isolated Parts of the Province.

These lessons are conducted in conjunction with the mining course mentioned above, and the pupils include those who live beyond reach of any school and the children of the lighthouse-keepers. For many years no attempt was made to offer opportunities to those who undertook the pioneer work of the Province; now, however, we have the satisfaction of reporting that 300 pupils are participating in the benefits presented.

I have, etc.,

JOHN KYLE,

Organizer of Technical Education.

ELEMENTARY AGRICULTURAL EDUCATION.

REPORT OF THE DIRECTOR.

VICTORIA, B.C., September 30th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I have the honour to submit the following report dealing with elementary agricultural education for the year ending September 30th, 1921:—

As this report is being prepared two months earlier than usual, and as it has not been possible to obtain information from all of the schools so soon after the summer holidays, it will be found incomplete as to schools and pupils reported as taking part in school and home gardening.

Reports to date show that school-gardening was conducted in 119 schools by 194 teachers with 6,199 pupils in public-school grades, and that school-supervised home-gardening was conducted in 56 schools by 77 teachers with 721 pupils. Other home projects of an agricultural character, such as the rearing of poultry, pigs, and calves, have been carried on to a much greater extent than in former years, especially in those districts served by District Supervisors of Agricultural Instruction.

During the year school-gardens were discontinued in a number of schools in favour of supervised home-gardens, whilst in others they were discontinued on account of unfavourable gardening conditions or on account of expense. On the other hand, new school-gardens were established, or old gardens enlarged to include additional divisions, at the following schools: Alberni, Armstrong, Chemainus, Enderby, Nanaimo, County Line, Glenwood, Langley Prairie, Murrayville, Peardonville, Ruskin, Albion, Trites, Summerland, Chu Chua, Cobble Hill, Arrow Park, One-mile Creek, Rexmount, and Williams Lake. Similarly, supervised home-gardens were reported for the first time from the following schools: Armstrong Consolidated School District, Chilliwack Central School, Vernon Central, eight schools in Chilliwack Municipality, six schools in Langley, three in Surrey, two schools in South Vancouver, also Cobble Hill, Cowichan, Fauquier, Grantham, Happy Valley, Merville, One-mile Creek, Royston, Sandwick, and Williams Lake. Notwithstanding the difficulties that the long summer vacation entails in operating school-gardens, the fact remains that where the teachers are in thorough sympathy with the work and have a complete grasp of its significance as an educational means, the gardens have been completely successful from a horticultural as well as from an educational standpoint. On account of the very late season the gardens were late in getting started, but in most cases the work was well managed and the results quite satisfactory.

Horticultural success in school-gardening is always to be desired and should be aimed at, but educational values are vastly more important. To estimate the value of the school-garden in terms of the amount of produce raised would be foolishness indeed, and yet some people do this very thing. Others regard it as a means of training boys and girls in the principles and practice of gardening—in other words, teaching them how to make and care for gardens. Useful as such a training might be, that is a mere incident in connection with school-gardening. Its greatest values have to do with the development of personal ability and character. It provides for constructive activity with a directive purpose. It encourages independence in thinking and in doing. It develops initiative and resourcefulness. Its interests are stimulating and wholesome. It provides a daily challenge to new activity and new conquest. It teaches the thoughtless boy to be mindful of his fellows' interests whilst in the pursuit of his own. It engenders the spirit of fairness and of co-operation for the common good. It fosters a pride in one's ability to control and develop things and forces in his own wonderful environment of nature. It teaches respect for labour and engenders habits of thrift and economy. It tends to make a boy stronger in body, keener in intellect, self-reliant, and courageous. It makes boys and girls more sensitive to the beauties and harmonies of nature and more reverent in their attitude towards the sacredness of life itself.

As an educational instrument, the skilful teacher will use it continuously as a means to giving concreteness and reality to many school lessons and class exercises. The experiences arising out of school-gardening are so numerous and so varied that practically every subject on the curriculum will find a vitalizing and stimulating relationship in them. Garden plots, garden observations, garden activities, and even garden products provide the best possible occasion and much suitable material for effective work in arithmetc, reading, story-writing, drawing and colour work, geography and other subjects, and for any teacher to say that the school-garden hinders or obstructs his teaching in any of these branches is at once an admission of ignorance on his part of the first principles of the science of education. Surely school-gardening would be well worth while if for no other reason than that just mentioned—its vitalizing effects upon the teaching of the older subjects of the curriculum. The great need of the hour is a body of teachers not only skilful in the management of the school-garden, but also—and this is of greater importance—capable of using it to the best advantage from an educational standpoint.

HOME PROJECTS IN AGRICULTURE.

On account of limited area and bad gardening conditions it is not practicable to establish school-gardens in a great many schools in British Columbia, and for this reason school-supervised home-gardening and the home project in agriculture are being urged as supplementary to or as an alternative with school-gardening. A new circular dealing with this branch of the work was issued during the year and a fair commencement made. Whilst lacking some of the educational advantages of the school-garden, such as regular and direct class-instruction under the teacher and the constant stimulus of competition and comparison of results, it also possesses some outstanding advantages. The home project in gardening and agriculture tends to associate home activities with school interest, to the obvious advantage of both. The project method of study may seem new in school-work, but it is as old as human experience. It is the method by which all progress towards individual as well as social betterment has been made. It consists mainly in fixing upon certain worth-while things to be investigated or to be done, and then in a purposeful and orderly way to work—mentally and manually—towards the realization or accomplishment of those things. It is the embodiment of educational purpose, of interest, and of achievement. It harmonizes the interests of the two greatest and most democratic organizations of all time—the home and the school. The project method of study is as applicable to other subjects in the school curriculum as it is to agricultural subjects. It is really a great working principle in all human endeavour, including education. Every teacher could and should make use of it as a matter of good method in teaching. The agricultural home project has great possibilities in cities as well as in rural communities, and if properly conducted would do much to offset the vicious and growing tendency, so apparent amongst boys and girls of public- and high-school age, to seek mere pleasurable entertainment and gratification rather than personal improvement and service.

AGRICULTURAL CLUBS.

It has been found advantageous to bring together in occasional conferences boys and girls having a common interest in certain lines of agricultural and home-project work. This has been accomplished best by having them organized in clubs, in which case they appoint their own officers, draw up their own regulations, and conduct their own meetings. Such organization affords valuable practice in the rules of procedure in organized bodies, and also develops self-control and habits of correct expression in public speaking. Although these clubs may give special attention to some particular out-of-school interest or enterprise, such as gardening or the raising of live stock, their aim is more broadly educational. Varied programmes are carried out especially during the winter months with a view to the personal improvement of the members and the maintenance of interest in school-work generally. The District Supervisors of Agricultural Instruction are mainly concerned with these organizations and are finding them of considerable value in their respective districts.

SCHOOL FAIRS.

School fairs are being held in different parts of the Province this year, but it is not possible at this time to give the exact number. It has been the custom in British Columbia to hold the

The Boys' and Girls' Jersey Calf Club. Some of the winners at Chilliwack School Fair, 1921.

Dudley Durrance, West Saanich, winner in the vegetable-seed-growing contest, 1921.

The Tanner Bros., Junior, Keating, B.C., successful competitors in the vegetable-seed-growing contest, 1921.

school fair in conjunction with the general agricultural fair, and in most cases this has been found satisfactory. Practically every agricultural fair in British Columbia has its children's or schools' department, and in not a few cases the schools' section provides the chief attraction of the fair. Occasionally in districts where agricultural fairs are not held the teachers organize school fairs as separate school functions. The school fair serves a useful purpose, educationally and socially. It, at least once in the year, serves to focus the attention of the parents and of the general public upon the nature and quality of the work being accomplished in the schools. Small grants have been made towards the prize-list in connection with these school fairs and further consideration is now being given to the question with a view to establishing these grants on a percentage basis. The largest and most successful school fairs are being held in the districts served by District Supervisors, and the best results are obtained in those districts where the teachers stand together in support of the undertaking. The School Boards in these districts where school fairs are held co-operate with the agricultural associations and teachers' associations in providing prizes. In some cases private individuals have given very generous support by offering special prizes.

The competitions are of two kinds, school or class contests and individual contests. The former include school-garden exhibits, manual-training exhibits, domestic science, writing, drawing, and primary grade hand-work, and the latter such exhibits as chickens, rabbits, calves, and pigs, which usually come under club management, and such individual projects as may be included under sewing, cooking, wood-working, and home-garden exhibits.

This year the Jersey Breeders' Association has given most valuable assistance in the organization of Boys' and Girls' Jersey Calf Clubs. Three strong clubs were organized—one at Chilliwack, one at Salmon Arm, and one at Armstrong—and three clubs of eight members each in the Comox District. In arranging and financing the purchase of pure-bred Jersey calves for the different club members, invaluable assistance has been rendered by the managers of local banks at these points—Mr. L. W. Smith, of the Merchants' Bank at Chilliwack; Mr. S. K. Campbell, of the Bank of Commerce at Salmon Arm; Mr. W. Smith, of the Bank of Hamilton; and Mr. C. B. Winter, of the Bank of Montreal at Armstrong. In a more general way the Canadian Bankers' Association has for several years been offering special prizes at most of the fall fairs for different classes of live stock owned and raised by boys and girls.

The chief difficulty experienced this year was that of securing a sufficient number of pure-bred calves to meet the demand. The results this year have been so satisfactory that the difficulty referred to will probably be even greater next year. This year it was found necessary, after securing all the available animals from local breeders, to import a car-load from the eastern townships of Quebec. So far not a single case has been reported where Calf Club members have fallen down on their project of calf-raising. On the other hand, the boys and girls have not infrequently won honours in open competition with the best stockmen exhibiting at the fall fairs. These clubs were all officially registered under the Department of Agriculture.

In some cases the school fair includes a series of athletic contests. At the Surrey Fair this year a programme of sports was splendidly carried out by a committee of energetic citizens. Every one of the numerous athletic events was keenly contested and the entire afternoon was spent in a very interesting manner. Councillor Joe Brown did much to assist the committee in promoting interschool contests by offering two handsome silver cups—one for the graded school winning the greatest number of points in the sports contests and the other for the ungraded school winning the most points. At this fair the midway faker was conspicuous by his absence, yet no one was heard to express any regret, nor did any one seem to miss this very questionable form of attraction.

School sports also formed an important part of the programme at the Langley Fair, which was held at Milner.

JUNIOR STOCK-JUDGING COMPETITIONS.

As a further development of this work and with a view to encouraging the careful study of farm animals, arrangements were made with the executives of the three largest fairs—Vancouver, New Westminster, and Victoria—for the holding of competitions in the judging of farm animals. Very generous prizes were offered and the response was most gratifying. In addition to the regular open contests in stock-judging for adults, and for boys and girls under 21 years of age, competitions amongst teams of three—boys or girls under 18 years of age—were arranged at

Vancouver and New Westminster. Six teams entered the competition at the Vancouver Fair, the winners being as follows:—

First prize ($100)—Won by a team of boys from Kamloops, coached by George Hay, B.S.A., District Agriculturist.

Second prize ($60)—Won by a team of girls from Chilliwack, coached by J. C. Readey, B.S.A., District Supervisor of Agricultural Instruction.

Third prize ($40)—Won by a team of boys from Comox, coached by S. H. Hopkins, B.S.A., District Supervisor of Agricultural Instruction.

Fourth prize ($30)—Won by a team of boys from New Westminster, coached by A. M. McDermott, B.S.A., District Supervisor of Agricultural Instruction.

Fifth prize ($20)—Won by a team composed of two boys and one girl from Victoria, coached by H. E. Hallwright, B.S.A., District Supervisor of Agricultural Instruction.

In the individual stock-judging competition at the Vancouver Fair, in which some twenty-five contestants took part, the awards were as follows: First, Harry Drake, Kamloops; second, Thos. Hopkins, Courtenay; third, Frank Frolek, Kamloops; fourth, Jean Thompson, Chilliwack; fifth, James Wright, Kamloops.

At New Westminster the competition was even more keen than at Vancouver, no less than eleven teams entering the contest and forty-seven boys and girls in the contest for individual judging for those under 21 years. The winners were as follows:—

(1.) For boys or girls under 21 years of age making the highest score in the judging of heavy horses, dairy cattle, and beef cattle: First, Lorna Ramsay, Victoria; second, Jean Thompson, Chilliwack; third, George Hodgson, New Westminster; fourth, Ernest Brooke, Salmon Arm.

(2.) For teams of three—boys or girls under 18 years of age—winning the highest number of points in the judging of the same three classes of live stock, 50 points being allowed for correct placing of animals and 50 points for written reasons. The first prize, which consisted of a challenge cup presented by the British Columbia Stock-breeders' Association and a gold medal to each member of the team presented by the Royal Industrial and Agricultural Society of British Columbia, was won by the Kamloops team, composed of Harry Drake, Frank Frolek, and James Wright, coached by George Hay, B.S.A., District Agriculturist. The second prize, a silver medal to each member of the team, was won by the Armstrong team, composed of Edward Patten, Dudley Pritchard, and Hector Ford, coached by J. B. Munro, B.S.A., District Supervisor of Agricultural Instruction. The third prize, a bronze medal to each member of the team, was won by the Chilliwack girls' team, composed of Bessie Macfarlane, Jean Thompson, and Constance Barton, coached by J. C. Readey, B.S.A., District Supervisor of Agricultural Instruction, Chilliwack.

A special cash prize of $30, donated by the British Columbia Dairymen's Association, for the team making the highest score in the judging of dairy cattle was won by the Comox team, composed of Tom Hopkins, Harry McQuillan, and Clive Davis, coached by S. H. Hopkins, B.S.A., District Supervisor of Agricultural Instruction at Courtenay.

A special prize of $12 for first place and $8 for second, donated by A. M. Paterson, M.L.A., for the highest score in the judging of heavy horses was awarded as follows: First, Jack Berry, Langley; second, Violet Grant, Enderby.

A special prize of $10, donated by Dean Clement, of the Provincial College of Agriculture, for the highest score made in the judging of beef cattle went to Harry Drake, Kamloops.

At the Victoria Fair the contests were altogether for individuals, with a sweepstakes contest open to boys or girls who had won first or second place in any previous judging contest in the Province. The results were as follows:—

Boys or girls under 21 years of age (cash prizes): First, Herbert Warren, Victoria: second, Alfred Clark, Victoria; third, Harry Doyle, New Westminster; fourth, Cecil Dick, Victoria.

Boys or girls under 18 years of age (cash prizes): First, Harry Drake, Kamloops; second, Lorna Ramsay, Victoria; third, George Hodgson, New Westminster; fourth, Alfred Clark, Victoria.

Sweepstakes for boys or girls under 18 years of age: First, gold medal and $15, Harry Drake, Kamloops; second, silver medal and $10, Jack Berry, Langley Prairie; third, bronze medal and $5, James Wright, Kamloops.

As the competitors came from different districts in the Province and as their selection as members of their respective teams is determined by their proficiency in this particular branch

of their agricultural studies—most of the competitors being members of High School Agricultural classes in the Province—these contests in stock-judging serve to stimulate interest during the year in agricultural studies. The exhibition executives of these three large fairs are deserving of praise for the very generous and enthusiastic support given to these stock-judging contests for young people engaged in agricultural studies. The executive of the Provincial Fair at New Westminster could not have done more than they did to make the stock-judging contests successful, and also to give the youthful contestants a thoroughly good time during their visit to this splendid exhibition. Not only did they pay the transportation of the contesting teams to the fair, which they had promised to do, but they also granted free admission to the fair, provided meals and lodging during their stay, and finished by tendering a complimentary banquet to the teams and their coaches and to many others who had been actively interested in the competitions. Referring to the banquet and to the junior stock-judging competitions, the *British Columbian*, of New Westminster, in an excellent editorial in the issue of September 17th, made the following statement:—

"There have been banquets and banquets at the exhibition, but the gathering of young men and maidens who took part in the junior stock-judging competition with the officials of the fair, the University men intimately connected with agriculture, and the District Agricultural Supervisors from various sections of the Province, was one of those really stimulating and inspiring affairs which will have an influence far afield. The junior stock-judging competition was one of the successes of the exhibition and, as President Nelson expressed it, one of the most practical features."

One of the interesting things about these contests was that country-bred and city-bred boys and girls were brought together as competitors on what might appear to be rather unequal terms. It was shown, however, that although the highest score was awarded to a team composed of the sons of prominent stockmen and coached by a man of recognized ability as a stock judge, some of the honours were won by boys and girls in the city who are students in High School Agricultural classes. The showing made by agricultural students in the Victoria and New Westminster High Schools would help to substantiate my own contention that agricultural science can be made a real success as a high-school subject in any high school in British Columbia, whether rural or urban.

In reporting the results of the junior stock-judging competition held at the Vancouver Fair, the Vancouver *Province*, under date of August 20th, made the following very complimentary statement with reference to agricultural instruction in British Columbia and the ability displayed by the young competitors in stock-judging:—

"There has been no better indication recently of the value of agricultural fairs nor no more hopeful sign for the agricultural future of the Province than the scene in the pavilion on Friday of six district teams of boys and girls under 18 years of age in a stock-judging competition. . . . The young agriculturists, all students of British Columbia high and public schools, judged horses, sheep, cattle, and swine. The written reports of the entrants in the competition showed a versatile knowledge and a familiarity with what is required in pure-bred animals that augurs well for the improvement of live stock in the Province."

Referring to the value of high-school instruction as carried on in British Columbia, the report in the *Province* continues:—

"That this teaching is invaluable to the agricultural development of the Province is the firm conviction of every one who has had any contact with the work. The children's practical as well as theoretical instruction and how well they have progressed was strikingly illustrated at the exhibition yesterday morning when confronted with several departments of stock and widely separated types of each breed they gave judgments such as might be expected only of those who have spent many years in the business. One of the teams, that from Chilliwack, was entirely composed of girls. The students were selected by the elimination process in each district. It was a decidedly interesting sight in the pavilion to see dainty young school-misses stepping around the animals with appreciative and calculating eye picking out their weak points almost as readily as a veteran stockman."

AGRICULTURE IN HIGH SCHOOLS.

The regular Two-year Course in Agriculture is now being taught in fourteen high schools to approximately 400 students, fully half of whom are girls. That girls can profit by these courses

as well as boys and can make as good a showing is being demonstrated daily in these high schools. The very creditable standing taken by the girls who entered the stock-judging contests came as a distinct surprise to many—perhaps all but their instructors. When it comes to teaching elementary agriculture and nature-study in our public schools, these young women will certainly be on familiar ground, and will not betray the weakness and almost helplessness in the teaching of this subject now commonly met with amongst teachers who have had no such preparatory training in their Public and High School Courses. Every teacher should have a good training in science subjects in the high school, and where possible in agricultural science as well. Very commendable alterations have been made in the Course of Study for High Schools in recent years which permit of a more thorough grounding in the sciences, for intending teachers particularly, but a great many boys and girls on entering high school with a view to preparing themselves to teach are not made aware of the benefits to be derived from a study of the science subjects as an important part of a teacher's training.

In the report of a committee composed of eighteen of the leading educationists in England, appointed by the Prime Minister to investigate the teaching of science under the educational system of Great Britain, the following conclusions bearing on this question are worth considering: "It is not easy to exaggerate the importance of some scientific knowledge for all teachers, for it enables them to link up their daily lessons with the facts with which all children, in town and country alike, are in natural and continual contact. It is extremely desirable that there should be a much larger number of teachers in elementary schools qualified to give instruction in science and that all possible steps should be taken to increase the supply."

As suggested by this committee, one of the great values to a teacher in having a good science training rests in the fact that it enables him to interpret to his pupils their complex natural environment and to make more meaningful to them their daily observations and experiences.

Agriculture as taught in the high schools of this Province is closely linked up with natural and experimental science, and can only be at its best educationally when taught in conjunction with the sciences. It provides a wealth of opportunity for applying the principles of physics, chemistry, and biology, and might almost be defined as science applied to the soil and its products as seen in plant and animal life. As taught in our high schools it is an educational rather than a vocational subject. Its vocational aspects must be regarded as secondary or incidental. The courses are not conducted with a view to producing farmers, but rather for the purpose of helping to develop responsible and resourceful citizens having some special knowledge of such fundamental things as the scientific production of the people's food and the economics of rural life and industry. Vocational courses in agriculture emphasize agriculture methods in the daily practice of farming, and can only be taught successfully in a well-equipped farm school. The Province of Alberta has about half a dozen of these agricultural schools and there are four or five in Eastern Canada. These are truly vocational schools where boys and girls may come to receive further instruction and direct practical training in the latest methods of farming and of home management. As would be expected in such vocational schools of agriculture and home economics, most of the time is spent on purely agricultural subjects, whilst the remainder is devoted to such subjects as English, history and civics, and science. In the fourteen high schools in this Province where agricultural courses are offered the class time allowed so far is approximately three hours per week. If this allotment of time could be doubled it would certainly help greatly in making the subject the success which its importance justifies, but even with the very limited time allowed the courses are improving and are steadily gaining in popularity.

NEW APPOINTMENTS.

In July last two new appointments were made. Mr. Wm. H. Grant, B.S.A., a graduate of the Ontario Agricultural College and a teacher of experience, was appointed District Supervisor of Agricultural Instruction for Salmon Arm City and Municipality. Mr. Grant has made a good beginning in his work in the Salmon Arm District and we are fortunate in being able to secure him for this position.

Mr. Tom H. Jones, B.S.A., also a graduate of the Ontario Agricultural College and a specialist in horticulture, has been appointed District Supervisor for the Penticton and Summerland District. As fruit-growing is the leading industry in this part of the Province, Mr. Jones will be able to put his technical knowledge of horticulture to good use in conjunction with his teaching in the district.

Winners in the Chilliwack Jersey Calf Club, 1921.

A few of the members of the Armstrong Jersey Calf Club.

Ralph Mitchell, Keating, B.C., one of the prize-winners in seed-growing.

A school-boy and some of the produce from his garden which he contributed to the Hospital, Vernon, B.C.

Very promising high-school classes in agriculture have already been formed in the high schools in these districts and a lively interest in the new work is being manifested generally.

NOTES FROM THE REPORTS OF DISTRICT SUPERVISORS OF AGRICULTURAL INSTRUCTION.

From J. C. Readey, B.S.A., Chilliwack District:—

"Number of students enrolled in Advanced Junior Grade Agriculture, 18; and in Matriculation Agriculture, 5. In general science thirty-two pupils are enrolled. All students who wrote advanced agriculture last June were successful in passing.

"This year home projects were added to the work required of the students in agriculture, with very satisfactory results. The parents as well as the students themselves have been deeply interested in the work.

"Supervision-work includes fifteen public schools in which classes are conducted in twenty-nine class-rooms. The garden-work and the nature-study teaching was better than in any preceding year. No less than 130 pupils availed themselves of the offer of the choice of five kinds of seed for home-gardening. These gardens were planned as supplementary to the family garden. At the School Fair seventy-three exhibits were made, special prizes being offered by the Chilliwack Parent-Teacher Association. The School Fair continues to grow. This year there was a total of 731 entries, covering many branches of school-work, with a prize-list of $580. The exhibit of home-garden produce and the live-stock exhibits of Jersey calves, Yorkshire pigs, grade bacon pigs, and poultry made substantial and attractive addition this year to the features of previous fairs.

"The organization of live-stock clubs in this district has been very successful and promises well. In co-operation with the Provincial Department of Agriculture, the Jersey Breeders' Association, the Dominion Poultry Association, and the Merchants' Bank of Canada, I have been able to organize the following clubs: A Poultry Club of 120 members; a Jersey Calf Club of 23; a Yorkshire Pig Club of 15; and a Bacon Pig Club of 15, the latter having 54 animals.

"In conjunction with the Department of Agriculture, an office has been opened in the Court-house in connection with the work of farm cost accounting. The field-work entailed by this, together with the club-work, helps to bring me into intimate and practical touch with the agricultural practice of the community, which greatly aids in the work of instruction in agriculture in the schools and especially in the High School. This work will make available most valuable first-hand information in the matter of production costs.

"The schools of this district were represented at the Provincial Fair at New Westminster in the Pig Club and Jersey calf contests and by a district school-garden exhibit. A stock-judging team composed of three girls—members of last year's High School class—entered the competitions in stock-judging both at Vancouver and New Westminster, winning second place at the former fair and third place at the latter, with eleven teams competing. A very creditable showing has been made by the district in all contests this year."

From E. L. Small, B.S.A., Surrey Municipality:—

"In connection with the High School work this year the following projects were developed: (1) Planning and operating of a home vegetable-garden; (2) variety and yield test for potatoes; (3) construction and care of hotbeds; (4) home improvement by means of flowers, shrubs, and lawns; (5) tests and records for dairy herds. The High School classes taught are as follows: First-year Agriculture, 12 students; Second-year Agriculture, 12; General Science, 17. The eighteen public schools of the municipality were visited regularly every two weeks. Aid was given by teaching type lessons, providing current publications, bulletins, and by the use of lantern-slides. Fourteen of the schools conducted successful school-gardens, with experimental work for the advanced classes. Home projects in the growing of seeds, potatoes, corn, home vegetable-gardens, and poultry-raising were organized in each school, and the produce was shown at the Surrey School Fair, and later at the Provincial Exhibition at New Westminster.

"I was pleased to be able to aid in the formation of the Surrey Parent-Teachers' Association, which did excellent work in establishing warm lunches for school-children. A local Teachers' Association and reading circle has also been formed for the coming term.

"I wish to thank the Department of Education for the educational course which I was allowed to attend at the Northern Normal and Industrial School Aberdeen, S.D., during the summer months. I was particularly interested and benefited by the courses in rural leadership, rural sociology, vitalized agriculture, and by special educational lectures delivered by prominent

lecturers in the United States. Such a course must necessarily be of great help to one engaged in rural educational work."

From J. M. Shales, B.A., B.S.A., Langley Municipality:—

The work here has made favourable progress during the year. Eight students are taking the Advanced Course in Agriculture and thirteen the First-year Course. This year our demonstration plots gave splendid proof of the value of the drainage system planned by the class last fall and installed during the winter. The experiments carried out by the pupils have given some very practical and definite results of value to the district, particularly those concerned with certain insect-controls and chemical fertilizers. The fifteen public schools of the municipality were visited once in two weeks for the purpose of assisting the teachers in nature-study and school-gardening. Over 300 pupils were furnished with garden seeds and other materials for carrying on home projects in agriculture. The results of these as well as the products of the school-garden were exhibited at the School Fair at Milner, making up the largest exhibition ever held here. A district school-garden exhibit was staged at the Provincial Exhibition and won first prize. A stock-judging team was trained for the competitions held at New Westminster and Victoria Fairs."

From A. M. McDermott, B.S.A., New Westminster:—

"During the year work carried on included: (1) Instruction in agriculture for High School classes, 29 enrolled; (2) instruction for night classes, 19 enrolled; (3) special class in agriculture for young men attending the Technical School, 14 enrolled; (4) assistance in the teaching of physics and chemistry in the Technical School; (5) supervision of agricultural instruction in the city schools.

"Upwards of 3 acres of land are at our disposal for practical work. This was surveyed in the early spring and planned to give practice in the best methods of soil-treatment, crop rotation and management, seed production, and landscape-gardening. Demonstration-work included milk-testing, incubation of eggs and care of poultry to early maturity, treatment and selecting of seed for ordinary field and root crops, including potatoes for certified seed, also experiments in the growing of grains, grasses, sugar-beets, and garden vegetables.

"During January, February, and March evening classes were held, when short courses were given in the following branches: Soils, dairying and dairy products, poultry and live stock. Classes were held from 7.30 to 9.30 on Tuesday and Thursday evenings, with an average of nineteen in actual attendance. Grateful appreciation is hereby expressed to Professor Lloyd, of the University of British Columbia; J. Renton, Head Nurseryman, Essondale; Dr. Chester, Provincial Veterinarian at New Westminster; and C. Tice, B.S.A., Provincial Department of Agriculture, for valuable assistance rendered during the course.

"Live-stock-judging teams were trained for competition at the exhibitions at Vancouver, New Westminster, and Victoria. Both boys and girls took part and did very creditable work, which seemed a fitting response to the efforts of the committees in charge of this new feature on the programmes of the various exhibitions.

"During the year an earnest endeavour was made to fill a worthy place in the great work of teaching, to enhance the enjoyment of life on the part of the growing youth, and by leading young men and women through educational agriculture to properly interpret the 'natural' world and as grown citizens to exert a corrective influence on 'unnatural' tendencies."

From J. B. Munro, B.S.A., Armstrong and Enderby:—

"All the first-and second-year students in the High School completed their Courses in General Science and Preliminary Agriculture in June—fifteen students in the former class and ten in the latter. This term eight matriculation students and ten in the second year are pursuing their studies in agriculture.

"A School Fair was held last month in which both teachers and pupils took a keen interest. Every school pupil had at least one exhibit entered. The fair was well attended by parents and others interested. Frequent stock-judging demonstrations were held at the leading ranches for the benefit of the students in the Agricultural class, from which a stock-judging team composed of three girls was selected for the competition at the New Westminster Fair. I was ably assisted in this work by Dr. C. M. Henderson; Mr. Charles Hardy, manager of the Stepney Ranch; and Mr. George Smedley, a poultry judge of Enderby.

"*Armstrong District.*—All the students of the Armstrong High School have chosen agriculture in their second and third years, general science having been taken during the first year,

and very keen interest in the work is being displayed. Eight matriculation and nineteen second-year students are enrolled in the classes.

"In addition to the class-room, garden, and laboratory studies, frequent visits have been made to greenhouses, creamery, dairy-farms, brickyard, market-gardens, ranches, and other places where practical first-hand information can be secured through direct observation. The study of live stock has been the basis of our work during the spring and summer, teams of horses, herds of cattle, and flocks of sheep being secured for nearly every lesson in the judging and handling of animals. Many ranchers and townsmen assisted in the work.

"Two live-stock clubs formed this year are now in existence among pupils of high and public schools. The Berkshire Pig Club has sixteen members, eleven of whom showed pairs of pigs at the recent Northern Okanagan Exhibition. Twelve boys and girls are members of the Jersey Calf Club, and ten of these showed their animals at the same fair at Armstrong. In open competition with animals owned and shown by adults, some of these calves were winners.

"A team of boys competed at the Vancouver Fair and also one at the New Westminster Fair, where they succeeded in winning second place. The stock-judging demonstrations and competitions have had a splendid effect on students and adults in this district."

From H. E. Hallwright, B.S.A., Victoria District:—

"The value of agriculture as a subject of general education, even when carried on in an urban environment, is coming to be recognized more and more. The peculiar character of the subject itself, its intimate and essential relationship to the every-day experience, even of boys and girls living in an urban or suburban environment, seems to justify its having a place in city high schools, and city people are coming more and more to recognize it as a balancing and co-ordinating factor in any course of instruction. In some rural districts, on the other hand, there is a tendency to withhold from the children that training which is so essential to intelligent farm practice to-day. This is owing to an idea that so-called 'white collar' jobs carry with them more distinction and also greater remuneration than the tilling of the soil or the raising of live stock, however 'honourable' such occupations might be. Agricultural instruction in Saanich—especially that part which had to do with school-gardening—has, for several reasons, partly economic, suffered a reverse, and the chief work carried on there during the season consisted of home-project work in seed production. The boys and girls of Saanich have responded to this home-project work with enthusiasm. Systematic instruction in the method of raising seed and in arranging of exhibits for the Saanichton Fair has been carried out. Prizes consisting of gold, silver, and bronze medals for first, second, and third prizes and a garden-cultivator for fourth have been provided for the winners in the seed-growing contest, and a good exhibit is assured.

"Special attention has been given to the work under way in the Victoria High School. The stimulus towards the study of live stock resulting from the junior competitions in stock-judging instituted by the executives of the Vancouver, New Westminster, and Victoria Fairs has been taken advantage of, and although facilities for demonstration and practice work are not all that could be desired in the vicinity of Victoria, yet the students in agriculture, mostly drawn from the Matriculation class, distinguished themselves beyond all expectation.

"The present Matriculation class in Agriculture numbers twelve students—six boys and six girls—and may yet have a few more added to the number. The Junior class is the largest we have ever had since the work was started, no less than thirty-three students—fourteen boys and nineteen girls—having enrolled. This is the limit of our present accommodation and a few of the late-comers had to be denied admission to the class. The predominance of girls taking the junior year may be traced to the recognized advantages to be derived from this course by those who are aiming to become public-school teachers, as most of the girls taking the course are looking forward to entering the teaching profession.

"Plans are under way for conducting evening classes in Agriculture during the winter months. These classes, which have been very successful in former years, are again being organized for the benefit of young men and women who are unable to attend high school, but who are desirous of obtaining technical instruction in certain branches of agriculture."

From J. E. Britton, B.S.A., Kelowna District:—

"During the school-year from September, 1920, to July, 1921, the work in Kelowna High School consisted of teaching and general instruction-work in agriculture for a class of eighteen—twelve boys and six girls. In addition to this, the General Science Course as outlined was taught with the Preliminary class, and the Botany Course with the Advanced Junior class.

"Commencing with the school term, September, 1921, two classes were enrolled for agriculture. In the Advanced Junior class there are twenty-one, consisting of ten boys and eleven girls. The Senior class has ten boys and four girls completing the work in agriculture for matriculation. To assist the teaching staff, the Course in General Science is again being taught by the Supervisor, with thirteen boys and nine girls. Assistance is also given in the Botany Course, particularly in the laboratory work for the two classes taking the subject.

"By arrangement with the Department of Agriculture, the Supervisor devotes half of his time to work in the district as Agricultural Representative for that Department. This leaves the first three days of the week for strictly school-work. There are many advantages in this arrangement, but often one branch of the work claims more attention than its allotted half-time allows, and while one helps the other in many ways, it is not always easy to turn from the planning and thought in one department to a consideration of the other."

From V. B. Robinson, B.S.A., Vernon District:—

"Under the co-operative scheme existing between the Department of Education and the Department of Agriculture, I devote half of my time to the interest of each department.

"The High School work has made satisfactory progress. There is an enrolment of twenty-one in the first year and six in the second. The idea that a Course in Agriculture need not necessarily be vocational, and that it is as valuable, from a citizenship point of view, to the boy or girl not strictly connected with the farm, but who lives in a rural district, as it is to one living on the farm, is commencing to be appreciated. An intelligent understanding and appreciation of the work will tend to make it more popular.

"The instruction commenced last year with the teachers of the public school will be continued. Time cannot be spared to give class-room instruction to each of the upper grades in the public schools, and this method is taken to reach the maximum number of pupils. Six teachers undertook school-gardening this past season and the same number of gardens will be conducted the coming year.

"My duties as Agricultural Representative have been chiefly concerned with a study of Okanagan soil conditions and problems. Last winter I outlined the necessary procedure for establishing a number of demonstration plots to show the uses and values of certain cover-crops and various fertilizer treatments. In the spring these were established in several orchards in the district. During the coming winter I expect to devote the major portion of my time to collecting data from representative growers regarding orchard yields and methods of soil management.

"This practical work has been of immense value to me in my teaching, permitting me to give a local application to the most of my class-room work. I find it, however, very difficult to maintain a proper balance between these two united and yet dissimilar fields of activity, as there is sufficient work in either to engage one's entire time."

From W. M. Fleming, B.S.A., Duncan District:—

"During the first term ending June 20th, 1921, I had nine students in Junior Agriculture, three in Senior, eight in First-year General Science, and nineteen in Botany. All of the students who took general science in their first year are taking agriculture this year. The classes at the present time are as follows: Junior Agriculture, 8 students; Senior Agriculture, 5 students; and General Science, 28 students.

"This year the following schools under my supervision had school-gardens: Duncan Central (five rooms), Cowichan Station, and Glenora. Seven pupils at Cowichan also had supervised home-gardens. Very creditable progress was made at Glenora this year. This school won the first prize at the Fall Fair, seven schools competing, for best exhibit from gardens planted at the school.

"Plans are being prepared for improvement of the school-grounds at Chemainus, and it is hoped that some progress will be made before the end of the year.

"As in 1920, the Education Division of the Fall Fair was specially emphasized in my work. This section, which this year had 752 entries, now attracts the attention of many visitors and is a feature of the exhibition. A Pig Club having nine members is carrying on successfully.

"Extension classes were held at Somenos one night per week from December 1st to March 15th, with an average attendance of seventeen.

"My work at Duncan is divided, half-time being given to teaching and supervision and half to Agricultural Representative work. An office has been established in the Agricultural Hall.

Section of flower-border in the High School experimental grounds at Vernon.

Junior stock-judging competition at Vancouver Fair, 1921.

Armstrong and Spallumcheen Consolidated School, 1921.

A record has been kept of visitors to the office, and an average of 170 persons per month visits this office for information and advice.

"During the past year satisfactory progress has been made and prospects are bright for continued success in all lines of work."

From S. H. Hopkins, B.S.A., Comox District:—

"My work in connection with the school has been chiefly concerned with the organizing and supervising of home-project work in home-gardening and competitions in the raising of chickens, pigs, and calves. These have been very successful. Five schools entered the competitions in home-gardening, each holding its own School Fair. These schools also sent exhibits to the Fall Fair at Courtenay.

"In the chicken-raising competitions there were seventy-five competitors, whilst in calf-raising there were twenty-four and in pig-raising ten. The judging in these competitions, with the exception of the chickens, was done by myself. The exhibits in nearly all cases were of very high grade and keen interest was shown by the children taking part in them. As poultry-raising is a phase of farming somewhat neglected in this district, these competitions are very important, as they help to arouse a keener interest in the industry and at the same time serve to distribute good strains of poultry over the farms of the district. As yet no class-work in general science and agriculture has been started in the Courtenay High School, as the School Board has not yet provided the necessary equipment for teaching these subjects. I hope to have these classes under way, however, within a few weeks."

As Mr. Grant, District Supervisor of Agricultural Instruction in the Salmon Arm District, and Mr. Jones in the Penticton-Summerland District have scarcely more than begun their work, no report has been received. Everything seems to indicate, however, that an excellent beginning has been made in each of these districts.

I have, etc.,

J. W. GIBSON,

Director of Elementary Agricultural Education.

SUMMER SCHOOL FOR TEACHERS.

VICTORIA, B.C., September 30th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit herewith a report on the summer school for teachers held in Victoria from July 4th to August 5th, 1921.

As in former years, most of the classes were held in the Victoria High School, where every facility for good work is provided for all classes, excepting those in Manual Training and Domestic Science. Accommodation was provided for the Domestic Science classes at the Central School, whilst the Manual Training courses were conducted in the Vancouver Technical School, chiefly on account of the fact that the great majority of students taking these courses, and the instructors as well, live in or near Vancouver.

The Provincial University summer school was in session from July 4th to August 13th and attracted a somewhat larger number of student teachers than last year, the total enrolment being 134. This year, as last, the Department of Education paid the transportation of teachers taking the courses in Vancouver as well as in Victoria.

The enrolment by classes in the Provincial Department of Education summer school was as follows:—

Rural Science	35
Primary Grade	60
Art	35
Manual Training	25
Home Economics	17
Music	15
Children's Literature and School Libraries	20
Total	207

As will be seen from the enrolment, the largest class of all was that established for Primary grade teachers. This course proved to be highly successful in every way, due chiefly to the very excellent instruction given. Professor Fred E. Coombs, M.A., who holds a high reputation in educational circles in the East for his outstanding ability as Professor of Principles and Methods in Primary Education in the Ontario College of Education, took full charge of the first part of the course, which dealt with the educational basis and method of Primary Grade work. His thorough and scholarly treatment of this important and rather difficult subject, as well as his own fine enthusiasm and personality, will not soon be forgotten by those who had chosen this course. The second or Manual Arts part of the course, which dealt with Primary Grade handwork, was conducted by Mr. Arthur E. Hutton, who is instructor in that branch in the Calgary Normal School. Mr. Hutton, in the very limited time allowed, gave his students not only a new conception of the educational bearing of Manual Arts work in the primary school, but also a high standard of efficiency in handling it.

The third part of the Primary Grade Course consisted in the giving of instruction in children's stories and dramatization and in daily demonstrations in methods of teaching and in the routine of class-room management. This part of the course was conducted by Miss Belle Dirimple, B.A., Principal of the Crown Hill Primary School, Seattle, Wash., who brought to this work extensive experience and high personal ability. One of the class-rooms in the High School was specially fitted up as a Primary Grade class and observation-room, where Miss Dirimple had charge of a class of small boys and girls from 10 to 12 o'clock daily.

A new course dealing with a study of children's literature for school and home use and the organization and management of the school library was included this year and proved to be of real value. The course was co-ordinated with the Primary Grade teachers' course. Instruction was given by Miss Gertrude Andrus, of Seattle, who has made a special study of children's literature, and by Miss Ellen Howe, Assistant Reference Librarian and Special Lecturer in Library Economy in the University of Washington. The course included a careful first-hand

study of children's books in the special children's department of the Victoria City Library from one to two hours daily, in addition to lecture periods conducted at the High School. The success with which this new course was carried out is in no small measure due to the enthusiastic co-operation and assistance given by Miss Helen Stewart, Librarian at the Victoria Public Library, and also by Miss Clay, of the Children's Department of the Library. Mr. Killam, Officer in Charge of the Travelling Libraries in British Columbia, also gave valuable assistance in connection with this course.

Two special or part-time courses were conducted this year. The Penmanship Course was taken by 126 students and the Course in Physical Training by fifty students. Mr. H. B. MacLean, who has just completed a new writing course for the schools, was in charge of the Summer School Course in Penmanship, and was assisted by Mr. R. W. MacKenzie, who conducted these classes a year ago. A special course of lectures and demonstrations in writing covering one week was also given by Mr. Frank H. Arnold, Supervisor of Writing in the schools of Spokane, Wash. The Course in Physical Training, which included gymnasium calisthenics, folk dances, games, swimming, hygiene, and corrective work, was conducted by Miss Margaret L. Brackett, Physical Director at Macdonald College, Montreal, and was highly successful. It is to be hoped that these special courses will be continued and that they will include even larger numbers of students as years go by.

As in previous years, Courses in Rural Science, Art, Vocal Music, and Household Economics were conducted, the result obtained being highly satisfactory. These courses are outlined in detail in the "General Announcement of Summer School Courses," published by the Department and distributed to the teachers previous to the opening of the school. The subjects included in the above courses and the instructors in charge were as follows:—

School-gardening and Poultry-study—A. M. McDermott, B.S.A., New Westminster.
Home-project Work, School Fairs, and Club Organization—V. B. Robinson, B.S.A., Vernon.
Soil-study and Field Husbandry—J. C. Readey, B.S.A., Chilliwack.
Horticulture and Floriculture—J. E. Britton, B.S.A., Kelowna.
Plant-studies—George B. Rigg, A.M., Ph.D., Professor of Botany, University of Washington, Seattle.
Insect-studies—R. C. Treherne, B.S.A., Entomologist in British Columbia for the Dominion Government.
Animal Husbandry and Bird-study—W. M. Fleming, B.S.A., Duncan.
Dairying and Bee-keeping—J. B. Munro, B.S.A., Armstrong.
Agricultural Chemistry and Bacteriology—J. M. Shales, B.A., B.S.A., Murrayville.
Preliminary Art Course, Nature and Object Drawing, Lettering, and Design—W.P. Weston, Art Master, Vancouver Normal School.
Advanced Art Course, Drawing and Painting from Objects, Applied Design, and Lettering—John Kyle, A.R.C.A., Art Master, and Miss Adeline Baxter, Supervisor of Drawing, Winnipeg, Manitoba.
Manual Training, Pedagogics, Theory and Class-teaching, Drawing, Mechanics, and Design—Alexander S. Hamilton, Supervisor of Manual Training, South Vancouver.
Metalwork Course—Harry A. Jones, Instructor in Metalwork, Vancouver Technical School.
Preliminary Home Economics—Miss Grace Dutcher, Vernon.
Advanced Home Economics—Miss Edith Bowman, B.Sc., Technical High School, Edmonton, Alta.
Vocal Music and Elocution—Miss Ethel M. Coney, Music Mistress, Vancouver Normal School.

It is a matter of some regret that a larger number of our public-school teachers do not avail themselves of the splendid opportunity offered in these summer courses. Those who attend from year to year will testify as to the value derived from the summer courses, but these represent only about 10 per cent. of the teachers of the Province. A Public School Inspector in an Eastern Province was recently reported as having stated, in reply to an inquiry regarding his supply of teachers, that he had some good ones and some mechanical ones, and that most of the good ones were taking summer courses, while none of the mechanical ones were. With only one out of every ten of our teachers in British Columbia attending summer school, one might seem justified in asking whether a large number were not becoming too mechanical in their profession. If the

summer courses provided are not those which the majority of our public-school teachers desire, we would do well to alter those courses, or add to them that which may perchance make an appeal to a larger number. Certain it is that no teacher can cease to be a student and long remain successful in his work. With a view to having the 1922 summer school serve a larger number of our teachers, I would recommend that additional courses be offered. It has been the usage for years in this as in other Provinces to limit summer-school instruction to the newer subjects in education, such as nature-study, manual training, agriculture, domestic science, music, etc., on the assumption that teachers generally were less familiar with these, and therefore needed special instruction in them rather than in the older subjects. This situation is changing, however, and with it the function of the summer school. Without doubt there is still need of giving special attention to the teaching of these newer subjects, and more particularly to the educational unity which calls for the intimate correlation of these newer subjects with the older, more formal subjects of the curriculum, but there is also need of further instruction in methods pertaining to the older subjects themselves. The "educational waste" sometimes referred to in connection with the teaching of the newer subjects on the curriculum, if carefuly looked into, might be traced rather to obsolete methods in connection with the teaching of the older subjects.

The Normal Schools do well in the limited time at their disposal to give their youthful graduates a reasonably good start along the line of general educational principles and of special method, but this preparation needs subsequent development which practice in teaching alone cannot give. It remains for the teachers' summer school or the summer session of the University to supplement and develop the professional training so well begun in the Normal School—a sort of post-graduate course in the science and practice of education, not limited merely to a few of the newer subjects, but broad and generous in the courses offered.

As in former years, arrangements were made for a series of Friday evening lectures, when the students and the public generally were privileged to listen to lecturers of ability from outside points. The first of these was given by Dr. Jas. W. Robertson, C.M.G., Dominion Commissioner of Boy Scouts and Chairman of the Red Cross Society in Canada, who delivered a most illuminating and forceful address on "National Movements for Good Health and Good Citizenship," the Honourable the Minister of Education presiding. The three following weekly lectures were given by Dr. Coleman, Dean of the Faculty of Arts and Science in the University of British Columbia, on "Poetry and Childhood"; by Dr. Weir, Principal of the Provincial Normal School at Saskatoon, Sask., on "An Educational Outlook"; and by Dr. Haggerty, Dean of the Faculty of Education in the University of Minnesota, on "Some Children I Have Known." These open lectures were well attended by the students as well as by the people of the city.

The social life of the school was never better. The splendid "school spirit" which existed throughout was a matter of frequent comment amongst the instructors, and whether at work or at play enthusiasm and good-fellowship were everywhere in evidence. Occasional class picnics and excursions, together with the weekly at home and dance, helped to bring the students together in pleasant and beneficial association. The annual summer-school picnic was again held at the Experimental Farm at Bazan Bay, as the social and entertainment committee were a unit in favouring this point. As in previous years, the return trip included a most delightful hour or two at the beautiful Butchart gardens and also a basket supper at Observatory Hill, after which a visit was paid to the observatory before returning to the city.

On Tuesday evening of the last week the students of the Music class, under the direction of their instructor, Miss E. M. Coney, Music Mistress in the Vancouver Normal School, gave a very pleasing and interesting programme in the Assembly Hall, and on Thursday evening an exhibition of summer-school work was arranged in the various class-rooms of the High School. The quality of the work displayed certainly gave ample testimony as to the skilful and painstaking work of both students and instructors. The exhibits of work in the Manual and Art Departments were particularly good and were greatly admired by the large number of visitors that attended.

The formal closing took place in the Assembly Hall during the same evening, Mr. S. J. Willis, Superintendent of Education, presiding. An address was given by the Hon. John Oliver, Premier of British Columbia, in which he expressed hearty commendation of the work of the students and their instructors, and expressed the hope that still further branches of study might be included in these summer courses for teachers. Immediately on the close of the meeting in the Assembly Hall the large audience was treated to a very delightful programme of folk dances and music,

which was carried out in the gymnasium by the pupils of the Physical Training class under the direction of their instructor, Miss Brackett, assisted by local musical talent.

The summer-school classes closed at 3 p.m. on Friday, August 5th, amidst many expressions of appreciation from the students on behalf of the school in general and in praise of the fine work of the instructors in particular. Certainly the 1921 summer school has set a standard for good work on the part of both the students and instructors that will be difficult to surpass in future schools.

I have, etc.,

J. W. GIBSON,

Director of Summer School.

FREE TEXT-BOOK BRANCH.

EDUCATION DEPARTMENT, FREE TEXT-BOOK BRANCH,
VICTORIA, B.C., September 30th, 1921.

S. J. Willis, Esq.,
Superintendent of Education, Victoria, B.C.

SIR,—I beg to submit the following report on the work of the Free Text-book Branch for the school-year ending June 30th, 1921:—

SUPPLIES ISSUED.

The total number of free text-books, etc., issued during 1920–21 to the public schools (common, graded, superior, high, night, etc.), and in connection with the Correspondence Course established for children in isolated districts where schools cannot be maintained, was as follows: 13,087 B.C. Beginner's Reader; 283 Teacher's Handbook to Beginner's Reader; 12,133 B.C. Phonic Primer; 11,270 B.C. First Reader; 11,230 B.C. Second Reader; 11,681 B.C. Third Reader; 9,859 B.C. Fourth Reader; 972 N.C. First Primer; 1,276 N.C. Second Reader; 3,257 N.C. Fifth Reader; 20,705 First Arithmetic; 17,201 Second Arithmetic; 10,986 New Method Writing Pad, Part I.; 6,471 New Method Writing Pad, Part II.; 56,218 Writing Book; 46,549 Drawing Book; 4,118 Supplementary Reader (Heart of Oak, Book I.; Art-Literature Primer; Art-Literature, Book I.; Art-Literature, Book II.; Progressive Road to Reading, Book 3A; Robin Hood Readers); 68 Essentials of Health; 8,154 How to be Healthy; 2,071 Latin Lessons for Beginners; 175 Canadian Civics; 192 Syllabus of Physical Exercises; 561 World Relations and the Continents; 8,148 History of Canada; 340 Teaching Writing, Books 1–4; 567,320 sheets Drawing Paper, 9 by 6 inches; 24,269 sheets Drawing Paper, 9 by 12 inches; 8,009 Public School Grammar; 158 Union Jacks (3-yard Jack); 196 Flora of Southern British Columbia; 36 "Scrap of Paper"; 38 "Fathers of Confederation"; 1,904 copies Children's Story of the War; 10 Globes; 39 Maps of British Isles; 42 Maps of Dominion of Canada; 51 Maps of World; 38 Maps of British Columbia; 50 Maps of North America.

At prevailing retail prices the books and other supplies issued would have cost $130,436.32.

Requisitions to the number of 3,507 for the above supplies issued were required to be filled. This called for a shipment to all parts of the Province of 698 cases and 2,786 parcels, the total weight of which was 203,296 lb. No shipment was lost in transit.

In addition to 3,507 requisitions filled in 1920–21 to meet the needs of the public schools and pupils taking Correspondence Courses, the Free Text-book Branch honoured 475 requisitions for departmental purposes and for those who required to purchase school supplies. These orders added 8 cases and 478 parcels (weighing in all 3,556 lb.) to the list of shipments for the year. The sum of $1,650.22 was received under this head and paid into the Provincial Treasury.

EXPENDITURE.

The chief expenditure of the Free Text-book Branch was made up as follows:—

Text-books, etc.	$69,733 66
Freight and drayage	4,294 88
Distribution (freight, boxes, etc.)	2,950 89
Salaries of staff	5,427 09
Temporary assistance	506 69
Total	$82,913 21

As already stated, the Free Text-book Branch distributed during the past school-year text-books and other supplies which would have cost parents and School Boards $130,436.32. To purchase and distribute these among the various schools of the Province through the Free Text-book Branch required an expenditure of $86,512.39, made up as follows:—

Text-books (laid-down cost)	$77,627 72
Distribution (freight, boxes, etc.)	2,950 89
Salaries of staff	5,427 09
Temporary assistance	506 69
Total	$86,512 39

The saving on the year's transactions is, therefore, $43,923.93. It may be explained, however, that the outlay for postage on parcels of free text-books to various points is not included in "Distribution." A similar remark applies to other items, such as office supplies, etc. Were these included the saving for the year would be slightly reduced.

It may be added that a considerable stock of supplies from the previous year was on hand at the commencement of the past school-year. This will account for the apparent discrepancy between $74,028.54 ($69,733.66 plus $4,294.88), the amount expended to purchase and lay down supplies for 1920–21, and $77,627.72, the amount of the laid-down cost of supplies distributed during that period.

Night-schools.

Of the night-schools in operation during the past school-year, seven were supplied with text-books of some kind by the Free Text-book Branch. Supplies were issued to pupils attending these schools on the same conditions as outlined in report of 1918–19.

Returns for 1920–21.

All the annual reports of free text-books for the school-year 1920–21 are now on file, with the exception of those from five schools. One of these schools has been closed and is therefore unable to make this return. The present teachers of the other four schools have been requested to advise the Free Text-book Branch as to the number of books on hand when the school opened at the beginning of the school-year 1921–22.

The majority of the annual returns show that care has been taken to keep an accurate record of all supplies received from this office. In some cases, however, it is quite noticeable that little or no attempt has been made by the teacher to account for the books in his or her charge. This is especially true of schools where there has been a change of teachers at the Christmas vacation. It was necessary for several teachers to apply to the Free Text-book Branch to ascertain what books had been supplied to their schools during the term before Christmas. This would have been unnecessary if the teacher for the first half of the year had entered the various books received at the school in the Teacher's Record Book. When the Principal's Record and Teacher's Record Books have not been accurately kept it makes it almost impossible for the teacher to submit the annual report.

In some instances the teachers have stated that they were unable to find several of the books reported on hand in the schools by the former teachers. This might be obviated in future if the teachers will count the actual number of books on hand at the close of the school-year and verify the numbers given in their annual reports.

While the majority of the teachers in the schools appear to be taking care of the Supplementary Readers, it is evident that some of them are not looking after these books as they should. A number of these Readers are reported missing and many are reported as unfit for further use before they have been used for more than two or three years. These books should last at least five years if used only in the class-room and care is taken that the pupils do not disfigure them unnecessarily.

In the case of a few schools it was necessary to withhold their supplies until the annual report was received. This delay could be avoided if the Secretaries of the various School Boards made a point of securing this return from the teacher at the close of the school-year before he or she left the district, and of then forwarding it to the Free Text-book Branch.

Free Text-books in Use.

The practice of addressing a printed inquiry to teachers about the free text-book system as applied to their schools was continued in 1920–21. All important errors revealed by the various replies received attention and any information asked for supplied.

New Price-list.

The price-list is being revised and a copy of the new list will be forwarded to every school. At the prices given therein teachers will be authorized to supply from the reserve stock (if any) second copies of free text-books to pupils who may require to replace lost or destroyed texts. The amounts obtained are to be remitted to the Free Text-book Branch at the time of sale.

I have, etc.,

J. A. Anderson,

Officer in Charge.

THE STRATHCONA TRUST.

Report of the Secretary, Local Committee, Strathcona Trust, for the Province of British Columbia, for the School-year 1920-21.

VICTORIA, B.C., October, 1921.

SIR,—I have the honour to report as follows on the work of the Local Committee for the school-year 1920-21:—

INSTRUCTION OF TEACHERS IN PHYSICAL TRAINING, 1920-21.

During the past year, 299 physical-training certificates, Grade B (Strathcona Trust Syllabus), were granted to prospective teachers in attendance at the Provincial Normal Schools (Vancouver and Victoria). About 3,591 teachers and prospective teachers of this Province have now qualified as physical-training instructors.

PHYSICAL TRAINING, 1920-21.

The list of Strathcona Trust prizes for excellence in physical training for the school-year 1920-21 is as follows:—

High and Superior Schools.

Inspectorate No. 1 (A. Sullivan, B.A., Inspector)—
1st Prize—Gordon Downes, B.A., 3rd Division, Oak Bay High School.
2nd Prize—J. Grahame Darling, B.Sc., 1st Division, Bridgeport High School.
3rd Prize—Miss E. M. Cadow, B.A., 3rd Division, Nanaimo High School.

Inspectorate No. 2 (J. B. DeLong, B.A., Inspector)—
1st Prize—H. M. Robertson, B.A., 2nd Division, Cranbrook High School.
2nd Prize—T. J. Barron, B.A., 1st Division, Nakusp Superior School.
3rd Prize—Not awarded.

Common and Graded Schools.

Inspectorate No. 1 (W. H. M. May, Inspector)—
1st Prize—Miss Edith Chandler, Nob Hill School.
2nd Prize—Mrs. Kate Ford, 2nd Division, Beacon Hill School, Victoria.
3rd Prize—Miss Isabel B. Scobie, 2nd Division, Merville School.

Inspectorate No. 2 (A. C. Stewart, Inspector)—
1st Prize—Miss S. E. Hardy, 14th Division, Quennell School, Nanaimo.
2nd Prize—Miss Maud Knappet, 4th Division, Lampson Street School, Esquimalt.
3rd Prize—Miss Agnes Waugh, 2nd Division, South Wellington School.

Inspectorate No. 3 (J. T. Pollock, Inspector)—
1st Prize—H. L. Paget, 2nd Division, Aberdeen School, Vancouver.
2nd Prize—Miss E. M. Pearson, 4th Division, Mount Pleasant, Vancouver.
3rd Prize—Miss M. A. Williams, 14th Division, Dawson School, Vancouver.

Inspectorate No. 4 (H. H. MacKenzie, B.A., Inspector)—
1st Prize—R. Straight, 1st Division, Lord Tennyson School, Vancouver.
2nd Prize—H. B. King, 1st Division, General Gordon School, Vancouver.
3rd Prize—H. A. Eckardt, 2nd Division, Mission City School.

Inspectorate No. 5 (L. J. Bruce, Inspector)—
1st Prize—Miss Edith A. Middlemiss, 6th Division, Henry Hudson School.
2nd Prize—Miss Dorothy M. Martin, 3rd Division, Magee School, Point Grey.
3rd Prize—Miss Maizie A. Suggitt, 4th Division, Henry Hudson School, Vancouver.

Inspectorate No. 6 (John Martin, Inspector)—
1st Prize—Miss H. R. Anderson, 2nd Division, Lord Selkirk School, South Vancouver.

Inspectorate No. 6—*Continued.*

2nd Prize—Mrs. Hazel M. Jex, 5th Division, Sir Alexander MacKenzie School, South Vancouver.

3rd Prize—George S. Wate, 1st Division, Secord School, South Vancouver.

Inspectorate No. 7 (F. G. Calvert, Inspector)—

1st Prize—Miss M. Simmons, 7th Division, Kingsway West School, Burnaby.

2nd Prize—J. Burnett, 4th Division, Gilmore Avenue School, Burnaby.

3rd Prize—Miss M. C. Morrow, 3rd Division, Kingsway West School, Burnaby.

Inspectorate No. 8 (Arthur Anstey, B.A., Inspector)—

1st Prize—W. T. Fennell, 1st Division, Herbert Spencer School, New Westminster.

2nd Prize—R. S. Shields, B.A., 1st Division, F. W. Howay School, New Westminster.

3rd Prize—Miss F. L. Whitworth, 1st Division, Murrayville School.

Inspectorate No. 9 (A. F. Matthews, M.A., Inspector)—

1st Prize—H. S. Hurn, 2nd Division, Merritt Superior School.

2nd Prize—Miss Kathleen Lawrence, 10th Division, Central School, Kamloops.

3rd Prize—Miss Margaret Wright, Louis Creek School.

Inspectorate No. 10 (A. R. Lord, B.A., Inspector)—

1st Prize—T. Aldworth, 1st Division, Central School, Armstrong.

2nd Prize—Miss Lillian Johnson, Okanagan School.

3rd Prize—Miss Dorothy Leckie, 6th Division, Central School, Kelowna.

Inspectorate No. 11 (A. E. Miller, Inspector)—

1st Prize—Miss Hazel M. Trembath, 3rd Division, Central School, Rossland.

2nd Prize—Miss Rebecca Johnston, Cascade School.

3rd Prize—Mrs. Edna H. Macpherson, Trout Lake School.

Inspectorate No. 12 (E. G. Daniels, B.A., Inspector)—

1st Prize—Miss Katherine Wallach, 8th Division, Central School, Nelson.

2nd Prize—Miss J. N. Corbett, 1st Division, Canyon City School.

3rd Prize—Thomas Prescott, 1st Division, Coal Creek School.

Inspectorate No. 13 (J. M. Paterson, B.A., Inspector)—

1st Prize—Miss Lena Wolfenden, 2nd Division, Ocean Falls School.

2nd Prize—Miss Ann M. McKinnon, 4th Division, Central School, Prince Rupert.

3rd Prize—Miss Jessie Rothwell, 3rd Division, Central School, Prince Rupert.

Inspectorate No. 14 (G. H. Gower, M.A., Inspector)—

1st Prize—Miss E. Milligan, 5th Division, Prince George School.

2nd Prize—Miss Drina Fraser, Fort Fraser School.

3rd Prize—Miss Marjorie Baker, 2nd Division, McBride School.

1st prize, $12; 2nd prize, $10; 3rd prize, $8; amount expended under this head for 1920–21, $472.

PHYSICAL TRAINING, 1921–22.

For competition among high and superior schools during 1921–22 the sum of $27 has been granted to each of the two inspectorates. This sum is to be divided into three prizes of $9 each. For the purposes of competition and inspection the schools are to be divided into three groups or classes, viz.: Group A, of five divisions or more; Group B, of two to four divisions, inclusive; Group C, of superior schools and high schools containing only one division.

For competition among public schools the sum of $432 has been granted—i.e., $27 (to be divided into three prizes of $9 each) for each of the sixteen inspectorates. For the purpose of competition and inspection the schools in each inspectorate are to be divided into three groups or classes, viz.: Group A, of five divisions or more; Group B, of two to four divisions, inclusive; Group C, of all ungraded schools. As the inspectorates are divided geographically rather than with regard to the size and classification of schools, it is realized that the above arrangement may not completely meet the conditions in a few cases. In any inspectorate, therefore, where this classification is found to be wholly unsatisfactory, the matter of dividing the schools into three groups or classes for the purpose of awarding three prizes of equal value is to be left to the discretion of the Inspector in charge. In all cases, however, the teacher and the class are to be considered as the unit in making comparisons for granting the awards. As before, the teacher to whom the award has been made shall be entitled to receive two-thirds of the prize; the other one-third to be expended for a picture or some piece of apparatus (suitably inscribed)

for the room in which it was won. Only those teachers who are the holders of physical-training certificates granted under the Strathcona Trust are eligible to compete.

MILITARY DRILL, 1920–21.

In June thirty-eight public-school cadet corps paraded for the annual inspection, 1920–21. The number then present was 3,658 out of a total enrolment of 4,157 boys of cadet age. Although the report of 1919–20 shows 3,855 cadets as present at the annual inspection, the difference is accounted for by the elimination of all cadets not over 12 years of age at the inspection in 1920–21. There were 5,300 cadets trained during 1920–21—a considerable increase over the number trained during 1919–20.

The comparative rank awarded by the Inspecting Officer at the annual inspection for 1920–21 is as follows:—

Corps.	Rank awarded.
No. 101. Vancouver Cadet Regiment—	
King Edward High School	1
No. 112. Victoria High School	2
No. 101. Vancouver Cadet Regiment—	
Britannia High School	3
King George High School	4
No. 530. Connaught High School (New Westminster)	5
No. 388. Victoria Cadet Battalion—	
Boys' Central School	6
No. 101. Vancouver Cadet Regiment—	
Lord Tennyson School	7
Cecil Rhodes School	8
No. 388. Victoria Cadet Battalion—	
North Ward School	9
No. 101. Vancouver Cadet Regiment—	
Aberdeen School	10
No. 388. Victoria Cadet Battalion—	
George Jay School	11
Sir James Douglas	12
No. 101. Vancouver Cadet Regiment—	
General Gordon School	13
Lord Nelson School	14
Fairview School	15
Alexandra School	16
Grandview School	17
Franklin School	18
No. 388. Victoria Cadet Battalion—	
Quadra School	19
Margaret Jenkins	20
No. 101. Vancouver Cadet Regiment—	
Laura Secord School	21
No. 372. Nanaimo School	22
No. 360. Kaslo School	23
No. 903. Kelowna School	24
No. 101. Vancouver Cadet Regiment—	
Dawson School (A)	25
No. 388. Victoria Cadet Battalion—	
Victoria West School	26
No. 101. Vancouver Cadet Regiment—	
Model School	27
Macdonald School	28
Lord Roberts School	29
Henry Hudson School	30

Corps.	Rank awarded.
No. 388. Victoria Cadet Battalion—	
Oaklands School	31
No. 101. Vancouver Cadet Regiment—	
Charles Dickens School	32
No. 854. Chilliwack School	33
No. 101. Vancouver Cadet Regiment—	
Dawson School (B)	34
Simon Fraser School	35
Strathcona School	36
Hastings School	37
No. 902. Cranbrook School	38

Twenty-five prizes were awarded in accordance with the schedule adopted at the last meeting of the Local Committee held on October 24th, 1921, one-half of each prize to be paid to the corps and one-half to the instructor, provided he is a public-school teacher qualified as a cadet instructor. When an instructor is not a public-school teacher, one-half of the prize reverts to the general fund of the Local Committee. The expenditure under this head for 1920–21 amounted to $305, and was made according to the following schedule:—

1st prize	$25	14th prize	$10
2nd „	20	15th „	10
3rd „	18	16th „	10
4th „	18	17th „	10
5th „	16	18th „	10
6th „	16	19th „	10
7th „	14	20th „	10
8th „	14	21st „	10
9th „	12	22nd „	10
10th „	12	23rd „	10
11th „	10	24th „	10
12th „	10	25th „	10
13th „	10		

Comments by the Organizing and Inspecting Officer (Lieut.-Col. W. H. Belson) in his annual report to the Local Committee are here noted:—

"The efficiency of the cadets is steadily improving—the improvement being specially noticeable in the larger centres such as Victoria and Vancouver.

"There were four cadet camps held in the district—at Sidney, Kelowna, Kaslo, and Cranbrook—with a total attendance of twenty-eight instructors and 1,009 cadets. This number could have been greatly increased if funds had permitted. The camps proved an unqualified success and both instructors and cadets were well pleased with the work carried out and the arrangements made for their comfort.

"The allowance to cadet instructors has been increased from $1 to $2 for the first fifty cadets trained and $1 for the remainder.

"A school for qualifying teachers as cadet instructors was held at Victoria for six weeks during the summer holidays, fifty-four teachers taking the course. Highly complimentary letters with regard to benefits derived from the course and the treatment received from the school staff have since been received from some of the teachers who attended."

RIFLE SHOOTING.

From the grant for rifle shooting, 1920–21, prizes were provided for thirty-nine qualified corps or units specified in returns—viz., $3.75 each; this amount to form cash prizes for the three best shots in each corps or unit (1st prize, $1,50; 2nd prize, $1.25; 3rd prize, $1).

The following accordingly received grants of $3.75 each for rifle shooting, 1920–21: Vancouver 101st Cadet Regiment (King Edward High School A and B, King George High School, Britannia High School, Henry Hudson, Alexandra, Cecil Rhodes, Charles Dickens, Lord Nelson, Simon Fraser, Model, Laura Secord, Grandview, Hastings, Lord Tennyson, Aberdeen, Lord Roberts, Dawson A and B, General Gordon, Strathcona, Macdonald, Fairview, Franklin, Kitsilano); Victoria No. 388 Cadet Battalion (George Jay, Sir James Douglas, Oaklands, Quadra, South

Park, Boys' Central, Victoria West, Margaret Jenkins, North Ward); Victoria High School, No. 112 A and B; Penticton, No. 788 A and B; Chilliwack, No. 854.

FINANCIAL STATEMENT FOR 1920–21.

The funds at the disposal of the Local Committee for 1920–21 amounted to $1,412.76 and the expenditure for the year $923.25, leaving a balance of $489.51. Of the latter sum, $486 has already been voted for physical-training prizes for 1921–22.

Receipts.

1920–21.	Balance on hand from 1919–20	$ 489 46
	Interest to November 30th, 1920	14 00
	Uncashed cheques (paid into fund)	12 98
	Interest to May 31st, 1921	7 57
	Allowance to Secretary (added to fund)	9 85
	Grant for 1920–21	878 90
		$1,412 76

Disbursements.

1920–21.	Prizes for physical training	$ 472 00
	Prizes for military drill	305 00
	Prizes for rifle shooting	146 25
		$ 923 25
	Balance on hand	$ 489 51

LOCAL AID TO CADET CORPS.

Authority has now been given by Statute to School Boards to make expenditures from school funds in aid of cadet corps and of an extension of physical training. This is contained in section 129A, "Public Schools Act" (consolidated for convenience in 1921), and is as follows:—

"The Board of School Trustees of any school district may establish and maintain an advanced course in physical training, including gymnastic exercises or cadet instruction, or both, and the entire cost of all necessary equipment and of maintenance shall be defrayed by the Board of School Trustees; but where the time of any teacher is devoted wholly to such course, that teacher shall be included in the number of teachers on which the per capita grant payable to that school district by the Minister of Finance pursuant to section 19 or 20 of this Act is based."

I have, etc.,

J. L. WATSON,

Secretary, Local Committee, Strathcona Trust, for British Columbia.

PART III.

APPENDICES.

APPENDIX A.

TEACHERS' CERTIFICATES.

Following are the names of persons to whom certificates of qualification to teach were issued:—

ACADEMIC CERTIFICATES.

(Names in alphabetical order.)

Alexander, Elizabeth, M.A., University of Aberdeen.
Appleyard, Edith M., B.A., Western College, London.
Biggar, Ethel Isobel, B.A., University of London.
Black, George Patton, M.A., University of Manitoba.
Black, Norman Fergus, M.A., Ph.D., Queen's University and University of Toronto.
Boyd, Lillian Martha, B.A., University of British Columbia.
Bragg, Thomas George, B.A., University of Toronto.
Brown, Leo B., B.Sc., University of Alberta.
Campbell, Robert Henry, University of Saskatchewan.
Clarke, Denis.
Clement, William James, Queen's University.
Coates, Kathleen McKie, B.A., University of British Columbia.
Connor, Carl Y., B.A., University of Toronto.
Copley, Robert J., B.A., University of Alberta.
Copping, Marjorie, B.A., University of British Columbia.
Craig, Gwynnyford Anne, B.A., University of Alberta.
Dancey, Percy Morrow, B.A., Queen's University, Kingston.
Davidson, Edna Brown.
Draper, Hester Elizabeth, B.A., University of British Columbia.
Dunbar, John, B.A., Queen's University, Kingston.
Elsey, Charles Roy.
Falconer, Kathleen, M.A., University of Aberdeen.
Flint, Mrs. Eleanor J., B.A., University of Manitoba.
Giegerich, Laura Clinton, B.A., University of Toronto.
Gladwin, Aleen Harrison, B.A., University of British Columbia.
Harrop, Ruth Elizabeth, B.A., Queen's University, Kingston.
Hartness, Dumail Horatio.
Irvine, Florence Annabel, B.A., University of British Columbia.
Johnston, Edna Ruth, B.A., University of Manitoba.
Jones, Grace Eleanor, B.A., University of Wales.
Kion, Gertrude Anna.
Law, Elmer Ellsworth, B.A., University of Toronto.
Livingstone, John Hartwell, B.A., University of Manitoba.
Lockhart, William Love, M.A., University of Glasgow.
Lucas, Evyline Caroline A., B.A., University of British Columbia.
Lundie, George Archibald, M.A., University of Durham.
Magee, Vesta Isabel, B.A., Acadia University, Nova Scotia.
Marwick, Edna Marian, M.A., University of British Columbia.
Masterton, Robert B., M.A., King's College, Nova Scotia.
Matheson, Agnes Helen, B.A., University of British Columbia.
Mitchell, W. McGregor, B.A., Queen's University, Kingston.
Morris, Verna Edna, B.A., University of British Columbia.
Munro, Norman, B.A., B.Sc., University of Aberdeen.
MacDonald, George Duncan, B.A., St. Francis Xavier University, Nova Scotia.
McDowall, Jessie, B.A., University of London.
McIntosh, Mabel I., B.A., University of Alberta.
MacKirdy, Margaret, B.A., University of London.

ACADEMIC CERTIFICATES—*Continued.*

(Names in alphabetical order.)

McLeish, William Young, B.Sc., University of London.
Nicholas, Albert Perry, B.A., University of Saskatchewan.
O'Meara, Kathleen Marion Newton, B.A., McGill University, Montreal.
Parker, Edith Helen, B.A., Dalhousie University, Halifax.
Partridge, Phyllis Marion Ulmer.
Perks, Mrs. Lillian Charlotte, M.A., B.Sc., St. Andrew's University.
Reid, William Tennant.
Riddell, Annie Thorn, M.A., University of Glasgow.
Roy, Henrietta.
Siddons, John Donald, B.A., University of British Columbia.
Smith, Mrs. Edith M., B.A., University of Toronto.
Smith, Frederick Benjamin, M.A., University of Durham.
Swencisky, Dylora Mary, B.A., University of British Columbia.
Thompson, Marie Spence, B.A., University of Durham.
Thurrott, Alice Ethel, B.A., University of New Brunswick.
Walsh, Violet Charlotte, B.A., University of British Columbia.
Whitney, Ralph L., B.A., University of Toronto.

FIRST-CLASS CERTIFICATES.

(Names in alphabetical order.)

Alexander, Ottillie Dorothy Love.
Archibald, Ruby Clare.
Baillie, Eunice Elizabeth.
Balmer, Mary Lucinda.
Barnes, Margaret H.
Beairsto, Mrs. Elsie Parkin.
Binns, Marjorie.
Black, Dorothy Lindesay.
Blackwood, Isabelle Katherine.
Bowles, Myrtle Pauline.
Boyes, John Calvin Patterson.
Breadner, Mrs. Frances S. C.
Brennan, Alice Hart.
Broome, Enoch Bunting.
Brown, Jennie Frances.
Carruthers, William Thomas.
Condon, John Ernest.
Coombs, George Alexander.
Corry, Kathleen Florence.
Creelman, Jean Turner.
Curwen, Greta Elizabeth.
Darwin, Charles Bascom.
Dedolph, Lucy Laura.
Desrosiers, Marie Cecilia.
Disney, Gladys Mabel.
Dunlop, Mary.
Edwards, Ursula.
Elliott, Kathleen.
Findlay, Marjorie Livingstone.
Fletcher, Lillian Maud.
Gagnon, Eulalie Elizabeth.
Gammie, Jane Polson.
Garlick, Beatrice.
Godfrey, John D.
Grant, Neal.
Gray, Mrs. Laura B.
Hall, Howard Hager.
Hart, Ellen.
Hayton, Alma Beryle.
Henderson, Rachel Catherine.
Hendricks, Louise.
Horner, Barbara Jane.
Hunt, Adah Lilian.
Innes, Mary Winona Elizabeth.
James, Elizabeth.
Johnson, Hilda Gledhill.
Johnston, Edna M.
Johnston, Eleanor Isabel.
Kantz, Kathryn Lois.
Keatley, Nora Kathleen.
Keenan, John Kane.
Keeping, Ewart Allan (Interim).
Kidd, Eli Leeson.
Kirk, Katherine.
Kirk, Norman Leslie.
Laking, Vera Evelyn.
Lawrence, Olive Beatrice.
Lingard, Jane Josephine.
Livingstone, Ethel Belle.
Main, Hannah Scott.
Martin, Elizabeth Eva.
Martin, James.
Mercer, Marion Isabelle.
Murray, Marion V. (Interim).
Murray, Norman.
Macdonald, Pauline Mary Grant.
McIvor, Louise C.
MacKenzie, Agnes Tryphena.
MacLeod, William Roy.
Nakabayashi, Annie Kiku.
Oliver, Sarah Ellen.
Price, Edith Ethel.
Redpath, Muriel Annie.
Riddell, Georgina Gordon.
Roberts, Alexandria Mary.
Robertson, Archibald Philip.
Scott, Gladys MacRitchie.
Shaw, Mary Jeannie.
Skelding, Cecil Howes.
Skidmore, William.
Sparkes, Ralph Edward.
Spouse, Mrs. Margaret.
Stewart, Emma Mary.
Stuart, Dorothy Louise.
Thompson, Hazel M.
Thomson, Charlotte McGregor.
Vallance, Evelyn G.
Wagstaff, Nellie Ada.
Wallace, Edna Elizabeth.
Weatherbee, Ava Ryetta.
Webster, Lila H.
Whittaker, Helen Hazel.
Wilby, Elsie Louisa.
Williams, Ethel Jane M.
Williams, Ruth Naomi.
Wilson, Mary.
Wood, Alice Margaret.
Wood, Margaret Amelia.

SECOND-CLASS CERTIFICATES.

(Names in alphabetical order.)

Adair, Florence Elizabeth.
Adams, Edith Lilian.
Aikenhead, Edna Ross.
Aldcorn, Mary Findlay.
Allardyce, Catherine M.
Allen, Eva Muriel.
Anderson, Margaret Christine.
Andrews, Grace Mary.
Archibald, Marjorie Gordon.
Arkell, Kathleen.
Armstrong, Rachel.
Atkinson, Mrs. Mabel.
Auld, Marion Lucy.
Ault, Kathleen Sarah.
Baillie, Annie Taylor.
Ballson, Celene Agnes.
Barker, Jennie C.
Barr, Mary Eunice.
Barton, Lurlene Mary.
Baxter, Muriel Lillian.
Beach, Sarah Evelyn.
Beairsto, Harold King.
Beech, Laura Ethel.
Bell, Gertrude Helen Hope.
Bell, Irene Dora.
Bevan-Pritchard, Gilbert H.
Bewell, Wilfrid Frank.
Birkett, Arthur.
Birkett, Edith.
Black, Helen Margaret.
Boucher, Edrie Evelyn Alexandra.
Boulton, Mrs. Mary Edna.
Bowden, Beatrice Duthie.
Bowing, Martha Elvira.
Boyes, James Thomas.
Boyes, William Earl.
Brackett, Margaret A.
Braithwaite, E. Victor.
Brandon, Ilsa Sarah.
Brennan, William J.
Brown, Elizabeth Margaret.
Brown, Ethel Mary.
Burns, Sarah.
Burrow, Mary G.
Busby, Grace Elizabeth.
Cain, Florence Marguerite.
Cameron, Lila Evelyn.
Cameron, Lillian Mai.
Cameron, May.
Campion, Flora Isabel.
Carder, Winnifred.
Carlson, Esther Gunhilda.
Carlson, Ruth Matilda.
Carmichael, Thomas Spurgeon.
Carruthers, Dorothy Kathleen.
Carty, Margaret Veronica.
Caspell, Mrs. Fanny.
Cates, Kathleen Wilson.
Chadwick, Marjory Lory.
Chasteney, Kathleen Noel.
Cheeseman, Stephen A.
Chute, Isabella Beaton.
Clancey, Emma Violet.
Clark, Helen Bruce.
Clements, Ella Violet.
Cody-Johnson, Mary Adele.
Colman, Alice J.
Cordingley, Norma Millicent.
Creighton, Phyllis Ogilvie.
Crompton, Amy.
Davies, Charles Edgar.
Davis, Grace L.
Davis, Kathreen.
Davis, Violet Alma.
Deans, Margaret McCallum.
Dee, John Sanderson.
Denton, Beatrice Irene.
Dew, Annie Nina.
Dickman, Lavina Frances.
Dixon, Caroline.
Donley, Ethel Annie.
Douglass, Agnes Gray.
Driver, Esther Ruth.
Dryden, Grace Good.
Duke, Alma Mercer.
Edwards, Ethel Anne.
Elliott, Jennie May.
Elliott, Margaret Lillian.
Ellis, Muriel Mae.
Elsey, Gertrude Elizabeth.
Feakes, Harry James.
Featherstone, Kathleen M. G.
Fee, Edith Alberta.
Fee, Mary Ethel.
Ferguson, Eulalie Laird.
Ferris, Mrs. Agnes J.
Fielder, Rhoda Jayne.
Fletcher, Hazel M.
Foley, Wilbur Lucian.
Ford, Euphemia Grace.
Ford, Laura Joanna.
Forrest, Helen Dorothy.
Forrest, Sadie Jane.
Forster, Clara Catherine.
Gaudin, Francis Hugh.
Geddis, Jenda Hamilton.
Geekie, Jean.
Gibbs, Eleanor Josephine.
Gibson, Edith Eleanor.
Girard, Rowena May.
Graham, Helen.
Grant, Clara Annie.
Green, Edith Flora.
Green, Katie.
Hale, Winifred Kathleen.
Hand, Verna Margaret.
Hardwick, Dorothy Winnifred G
Hardwick, Walter Henry.
Hargreaves, Lucy.
Harris, Hermia.
Harrison, Margaret.
Haskin, Almera Sara.
Hastings, Violet Gordon.
Hayton, Freda May.
Head, Dorothy Grace.
Heady, Nellie.
Hodnett, Mrs. Jessie.
Hoggan, Dorothy Evelyn.
Hole, Gwendoline Mabel.
Homuth, Mary Lois.
Hopkins, Agnes Clara.
Horsman, Helen Dorothea.
Houston, Elizabeth Irvine.
Howarth, Mrs. Sara Julia.
Huddleston, Hilda.
Hurton, Gertrude.
Inglis, Bertha M.
Inglis, Mary Arnott.
Irvine, Robert Barker.
Irving, Norma Alfreda.
James, Lillias Olga.
Jerome, Agnes Elizabeth.
Johnson, Lyda Annie.
Johnston, Katherine Freda.
Kane, Joseph Patrick.
Keir, Marie Isabel.
Kellie, Evelyn Augusta.
Kennedy, Irene Mary Margaret.
Kidd, Ruby Winnifred.
Lade, Mary Eliza.
Larsen, Pauline.
Lavis, Charlotte Hannah.
Lee, Phyllis Joyce.
Link, Marion Martha.
Link, Mary Mildred.
Lloyd, Vida Valerie.
Logie, Grace.
Lusk, Gladys Muriel.
Lyons, Ronald Adlai.
Malott, Marion.
Martin, Catherine M.
Martin, Edith Irene.
Millar, Ethel J.
Miller, Ruby Robeson.
Moody, Ethel May.

SECOND-CLASS CERTIFICATES—*Continued.*

(Names in alphabetical order.)

Moore, Marion Elizabeth.
Morgan, Annie Allan.
Morrison, Marion Stephen.
Mouat, Gertrude Eleanor.
Moulton, Muriel Emma.
Murray, Louise E.
MacArthur, Olive Edwina.
McCaffrey, Elizabeth.
McCallum, Sara Vina.
Macaulay, Annie.
McClelland, Margaret L.
McColm, Sara W.
McCusker, Dorothy Victoria.
McDonald, Mauretta Evelyn.
McDougal, Colin.
McDougall, Margaret Alexandra.
McEachern, Mary.
McFadyen, Ida.
MacGill, Jennie Ethel.
McGowan, Virginia.
McIntosh, Cecelia M.
MacKay, Kate.
McKenna, Helen.
McKenzie, Louisa Victoria.
McKinnon, Annie Sophie.
McLaren, Myrtle Viola.
MacLeod, Helen Ethel.
McLeod, Ina Marguerite.
McLeod, Margaret Adelaide.
McManus, Edith Mildred.
McNairn, Christina.
MacNaughton, Eunice.
Nichols, Oliver.
Noble, Islay Barbara.
Olson, Vera Charlotte.
Owen, Lucy Ellen.
Pack, Mrs. Alice L.
Page, Beulah I.
Parker, Mona I.
Pears, Frances Winifred.
Pearson, Harry L. O.
Peresian, Alice Maud.
Peters, Camille Marie.
Peterson, Ida Helena.
Philip, Mary Brown.
Phillips, Edith Anne.
Piggott, Eleanora.
Port, Nellie Edna.
Postill, Mrs. Eleanor Armour.
Potter, Elsie.
Potter, Winifred Annie.
Pottinger, Myrtle Gladys.
Power, Laura R. M.
Preston, Marjory.
Pullen, Mabel F.
Raftery, Rosalie Alice.
Ratledge, Vera.
Reid, Hazel Ella.
Revercombe, Elsie Aileen.
Richmond, Lizzie.
Rogers, Victoria Elizabeth.
Ross, Carrie Evelyn.
Rowse, Florence Mina.
Russell, Mrs. Agnes G.
Sangster, H. Isabelle.
Scarth, Nellie B.
Schneider, Elizabeth Erna.
Scott, Mrs. Minnie.
Scurrah, Margaret.
Shaw, Sybil Jean.
Sheepy, Janet.
Short, Caroline E.
Smith, Brenda.
Smith, Harry.
Smith, Marie Aline.
Smith, Ruby.
Southam, Harold Davey.
Spiers, Grace Steel.
Stanton, Lilian Sarah.
Steward, Gilbert Richard.
Stewart, Edna Margaretta.
Stewart, Gertrude Elliott.
Stringer, Harold C.
Sutherland, Jeanne Henderson.
Sutherland, Wesley.
Sutton, Phyllis May.
Tait, Ina Belle.

APPENDIX B.

HIGH SCHOOL ENTRANCE EXAMINATION, JUNE, 1921.

ARITHMETIC. (Time, 2¼ hours.)

Value.

10 1. (*a.*) Express in figures: Thirty million, eighty-five thousand, six; three hundred and seven thousandths; three hundred seven thousandths; MDXCII.

(*b.*) Find the prime factors of 42, 56, and 70; from the prime factors find the H.C.F. and the L.C.M. of the three numbers.

10 2. (*a.*) Find the cost of 17½ yards of cotton at 17½c. a yard.

(*b.*) How many yards of muslin at 72c. a yard can be bought for $27?

(*c.*) What is a piece of cloth containing 46.7 metres worth at 26c. a decimetre?

12 3. (*a.*) A man walks 2½ miles. If he takes a step 32 inches in length, how many steps will he take in his walk?

(*b.*) Find the length of a side of a square field which contains 40 acres.

12 4. (*a.*) A school-room is 35 feet long, 28 feet wide, and 10 feet 6 inches high. There are 39 pupils in attendance. How many cubic feet of air-space does this provide for each pupil?

(*b.*) A wooden pillar is 3 feet square and 76 feet 8 inches high. Find its weight, if a cubic foot of wood weighs 29½ lb.

12 5. (*a.*) Find the tax on property assessed at $6,800 in a district where the rate of taxation is 18.7 mills on the dollar.

(*b.*) An architect charges 3¼% of the cost of a building for plans and specifications and 2½% for supervising the construction of the building. What would be his total commission on a building costing $15,750?

12 6. Find the cost at $4.70 a yard of the carpet required for the floor of a room 15 feet long and 12 feet 4 inches wide. The carpet is laid lengthwise in strips 30 inches wide.

16 7. A close board fence 4 feet high is built around a garden 72 feet long and 45 feet wide. The boards, which are 1 inch thick, are nailed to two lines of scantling 2 inches by 4 inches. The posts are placed 9 feet apart. Find the total cost of the lumber in the fence, if the posts were bought at 35 cents each and the boards and scantling at $28 a thousand feet.

16 8. A man sold his house and lot on October 3rd, 1920, and received in payment a promissory note for $4,900 payable two months later without interest. He discounted the note on the same day at 8% per annum. Find the amount of cash he received for the promissory note.

GRAMMAR AND COMPOSITION. (Time, 2 hours.)

Value.

27 1. Write the subordinate clauses in (*a*), (*b*), and (*c*), and the phrases in (*d*), stating the kind and relation of each:—

(*a.*) I should like to know how your friend found the house *where* I live.

Value.

(*b.*) There were many boys in the room by whom *that* little scene *was taken* to heart before they slept.

(*c.*) *Think* not, because thine *inmost* heart means well,
Thou *hast* the *freedom* of rude speech: sweet words
Are like the voices of returning birds
Filling the *soul* with summer, or a bell
That calls the weary and the sick to prayer.

(*d.*) *No* fires *have swept* over the hills and *left* behind them the desolation of a *bristly* landscape.

15 2. Answer the following questions regarding the italicized words in the above sentences:—
What part of speech is the word *where* and what is its relation?
That (in second sentence): Part of speech and relation?
Was taken: Transitive or intransitive? Why?
Think: Mood and person?
Inmost: Degree and relation?
Hast: Person and tense?
Freedom: Case and relation?
Soul: Case and relation?
That (in third sentence): Part of speech and relation?
No: Part of speech?
Have swept: Tense?
Left: What part of the verb?
Bristly: Part of speech?

12 3. Rewrite the following sentences, filling the blanks and giving in each case a reason for your choice:—

(*a.*) Each of the girls . . . a white rose. Use *has* or *have.*

(*b.*) . . . did you buy it from? Use *whom* or *who.*

(*c.*) John parted . . . him at the corner. Use *with* or *from.*

(*d.*) It is for . . . . Use *me and you* or *you and me.*

(*e.*) Neither George nor Thomas . . . there. Use *is* or *are.*

(*f.*) . . . I leave the room? Use *can* or *may.*

8 4. Write sentences showing that the word *last* may be used as a verb, a noun, an adjective, and an adverb; and that the word *as* may be used as a pronoun and a conjunction.

6 5. Give the voice of each of the following verbs, and then rewrite the sentences changing the voice of each verb without changing its tense:—
The rebels will be defeated by the loyal troops.
My father has bought a box of apples.

8 6. The following advertisement appeared in one of the daily papers:—
"WANTED—High school boy to assist about house and garden in return for board, clothing, and school expenses. Apply J. Williams, 5246 Robson St., Vancouver."
Write a letter applying for the position.

24 7. Write a composition on *one* of the following:—
The Unknown Soldier of Westminster Abbey.
What I would do if I had a Thousand Dollars.
Malcolm Graeme.
What I did on Christmas Day.
How I made my First Cake.
My First Pocket-knife.

DICTATION AND SPELLING. (Time, 1¼ hours.)

NOTE.—*The passages (questions A and B) are to be read slowly and distinctly to candidates three times—the first time to enable them to gather the meaning; the second time to enable them to write the words; the third time for review. Punctuation marks should not be dictated. Candidates are not permitted to rewrite the passages.*]

Value.

25 A. A fleet of canoes suddenly appeared, bounding down the rapids, filled with warriors eager for revenge. The allies had barely time to escape to their fort, leaving their kettles still slung over the fires. The Iroquois made a hasty and desultory attack and were quickly repulsed. They next opened a parley, hoping no doubt to gain some advantage by surprise. Failing in this, they set themselves, after their custom on such occasions, to building a rude fort of their own in the neighbouring forest.

25 B.

The war-pipes ceased, but lake and hill
Were busy with their echoes still;
And, when they slept, a vocal strain
Bade their hoarse chorus wake again,
While loud a hundred clansmen raise
Their voices in their Chieftain's praise.
Each boatman, bending to his oar,
With measured sweep the burden bore,
In such wild cadence as the breeze
Makes through December's leafless trees.

25 C. (1.) In idleness alone is there perpetual despair.

(2.) "A stranger I," the huntsman said.

(3.) I live in Brantford, Ontario. Where do you live?

(4.) They accepted the recommendations that were made by Premier Lloyd George.

(5.) The French took possession of the surrounding region of Acadia and Canada.

(6.)

The antlered monarch of the waste
Sprung from his heathery couch in haste.

(7.) Spain ceded Florida to Britain, while France rewarded her ally with the vast territory of Louisiana.

(8.) Before the end of the eighteenth century there appeared a vigorous rival that threatened to deprive them of their profitable monopoly.

25 D.

Educational institutions,
decimal currency,
essential features,
unfailing patience,
transportation facilities,
dangerous venture,
varied perils,
fearful dilemma,
steep ascent,
fateful answer,
characteristic costumes,
knitted goods,
solitary heath,
purple peak,
reflected hue,
beach of pebbles,
irrigated district,
harsh criticism,
defenceless condition,
military service,
heroic theme,
Yours truly,
too hurriedly,
envious tongues,
stern pursuit.

GEOGRAPHY. (Time, 2 hours.)

Value.

12 1. Your study of geography has shown you that three important influences affecting the climate of a country are: (*a*) Latitude; (*b*) direction of prevailing winds; (*c*) location and direction of highlands. Show how each of these affects the climate of: (*a*) Coast of British Columbia; (*b*) central part of South America.

10 2. What causes account for floods in the lower courses of the Nile and Fraser Rivers? In what ways are these floods: (*a*) Beneficial; (*b*) harmful?

10 3. What three countries make up the island of Great Britain? Name the chief occupations of the people in *one* of these countries, indicating districts or centres where the occupations you have named are carried on.

24 4. There are, on an average, one hundred and eighty persons to the square mile in India and only two to the square mile in Canada.

(*a.*) Give reasons why India is so much more densely peopled than Canada.

(*b.*) In what districts or areas of each of these countries do we find the densest population? Account for this.

(*c.*) In the case of each country, name *three* important exports and *three* important sea-ports.

(*d.*) What would you expect to be a leading *import* into each country? Give reasons for your answer.

(*e.*) Write three or four lines about the form of Government of each country.

28 5. Draw, as large as your paper permits, a map of the Dominion of Canada. Indicate the boundaries of the Provinces of British Columbia, Alberta, Saskatchewan, and Manitoba; mark with a dot or small circle the location of each of the following cities, and neatly print in the name: Edmonton, Brandon, Winnipeg, Regina, Calgary, Vancouver, Revelstoke, Prince Rupert, Victoria; trace the main line of the C.P.R. System from Winnipeg to Vancouver; show, by neatly printing on your map the words OIL, COAL, STOCK-FARMING, LUMBERING, the regions where these products, or industries, are of special importance.

16 6. Make a sketch-map of Australia. Indicate where the Tropic of Capricorn crosses the Continent; neatly print in the names of three adjoining coast waters, the six States of the Commonwealth, the following cities: Melbourne, Sydney, Adelaide, Brisbane, and Hobart; show and name the Great Dividing Range and the Darling-Murray River System.

BRITISH HISTORY. (Time, 1¾ hours.)

Value.

12 1. Write an account of the rise and fall of Cardinal Wolsey.

12 2. (*a.*) Describe some of the methods Charles I. used to raise money while trying to rule without a Parliament.

(*b.*) What finally forced him to call a Parliament?

18 3. (*a.*) When were the Crowns of England and Scotland united? When were the parliaments united?

(*b.*) State the terms upon which the parliaments were united.

(*c.*) Why was the union of the parliaments so long delayed after the union of the Crowns?

14 4. What events, measures, or policies made the following persons famous: (*a*) Walpole; (*b*) Chatham; (*c*) Lord John Russell; (*d*) Lloyd George?

Value.

14 5. Write on any *two* of the following:—

(*a.*) The Petition of Right.

(*b.*) Pride's Purge.

(*c.*) The Test Act.

(*d.*) The Declaration of Rights.

12 6. (*a.*) Mention reforms brought about by Pitt the Younger.

(*b.*) What event interfered with his plans for further reforms?

18 7. Show how British industry was affected by: (*a*) Opening of canals; (*b*) opening of railways; (*c*) invention of the fly-shuttle; (*d*) invention of Arkwright's frame.

CANADIAN HISTORY. (Time, 1¾ hours.)

Value.

15 1. (*a.*) Name, with dates, the different Acts of Parliament under which Canada has been governed since the country became a British possession.

(*b.*) What Parliament passed these Acts?

(*c.*) Under which Act is Canada governed to-day?

15 2. Give an account *either* of the War of the American Revolution in so far as it affected Canada, *or* of Lord Durham's mission to Canada.

15 3. (*a.*) Who were the United Empire Loyalists?

(*b.*) Where in Canada did they principally settle?

18 4. Explain any *three* of the following:—

(*a.*) Reciprocity Treaty.

(*b.*) National Policy.

(*c.*) Municipal Government.

(*d.*) Family Compact.

(*e.*) Fenian Raids.

15 5. (*a.*) Give the causes which led to the war of 1812–14.

(*b.*) In what three regions was Canada attacked in this war?

12 6. Name four Prime Ministers of Canada since 1867 and give an account of the career of *one* of them.

10 7. (*a.*) Who is the Premier of Canada; Governor-General of Canada; Lieutenant-Governor of British Columbia; Premier of British Columbia?

(*b.*) What is meant by a Coalition Government?

ENGLISH LITERATURE. (Time, 2 hours.)

Fourth Reader.

Value.

10 1. Quote any *one* of the following:—

(*a.*) The Charge of the Light Brigade, 3 consecutive stanzas.

(*b.*) "Break, break, break . . . " 4 stanzas.

(*c.*) Twenty-third Psalm.

(*d.*) "When I look upon the tombs of the great . . . " 19 lines.

15 2. Assign to author and selection each of the following quotations, and explain the references contained in the italicized words:—

(*a.*) *He* told them of a *river* whose mighty current gave
Its freshness for a hundred leagues to ocean's briny wave.

(*b.*) O just and faithful *Knight* of God!
Ride on! the *prize* is near.

(*c.*) I gazed and gazed—but little thought
What *wealth* the *show* to me had brought:

(*d.*) Blessed is he who has found his work; let him ask no other blessedness.

16 3. Give in your own words the thought expressed in each of the following passages:—

(*a.*) Now dance the lights on lawn and lea,
The flocks are whiter down the vale,
And milkier every milky sail
On winding stream or distant sea.

(*b.*) Regions Caesar never knew
Thy posterity shall sway
Where his eagles never flew
None invincible as they.

(*c.*) And never earth's philosopher
Traced with his golden pen
On the deathless page truths half so sage
As he wrote down for men.

(*d.*) For if the worst befall me, why better axe and rope
Than life with Lenthall for a King, and Peters for a pope.

9 4. In his poem, "The Red River Voyageur," in what three ways may Whittier be said to compare the journey of life with the journey of the Voyageur on the Red River of the North?

The Lady of the Lake.

13 1. An instant in this porch she staid,
And gaily to the stranger said,
"On heaven and on thy lady call,
And enter the enchanted hall!"

(*a.*) Write a description of the "enchanted hall" on Ellen's Isle.

(*b.*) Narrate what occurred on the instant that the stranger crossed the threshold.

(*c.*) Who was the stranger? Who was his guide?

(*d.*) By whom and in what manner was he entertained?

11 2. (*a.*) What was the Highland Coronach?

(*b.*) Why was the loss of Duncan of Duncraggan likened to "a summer dried fountain when our need was the sorest"?

(*c.*) Describe the part taken in the stirring events that followed by Angus the son of Duncan.

(*d.*) During the battle of Beal an Duine, what heroic deed was performed by "Duncraggan's widowed dame"?

Value.

16 3. Clearly explain each of the following passages, giving in each case the setting in the story:—

(*a.*)
And from the silver beach's side
Still was the prow three fathom wide
When lightly bounded to the land
The messenger of blood and brand.

(*b.*)
Farewell to thee,
Pattern of old fidelity! . . .
. . . . . .
Tell Roderick Dhu, I owed him nought,
Not the poor service of a boat.

(*c.*)
Why is it, at each turn I trace
Some memory of that exiled race?
Can I not mountain-maiden spy
But she must bear the Douglas eye?
Can I not view a Highland brand,
But it must match the Douglas hand?

(*d.*)
Pent in this fortress of the North,
Think'st thou we will not sally forth,
To spoil the spoiler as we may,
And from the robber rend the prey?

10 4. Quote any *one* of the following:—

(*a.*) Fourteen lines beginning, "The western waves of ebbing day."

(*b.*) Twelve lines beginning, "No rude sound shall reach thine ear."

(*c.*) "Hail to the Chief," 2 stanzas.

(*d.*) "Harp of the North, farewell!" 2 stanzas.

DRAWING. (Time, 2¼ hours.)

Value.

21 (*a.*) Select three examples of work from your drawings, as follows:—

1. The best example of freehand design (coloured).
2. The best example of object or model drawing.
3. The best example of printing.

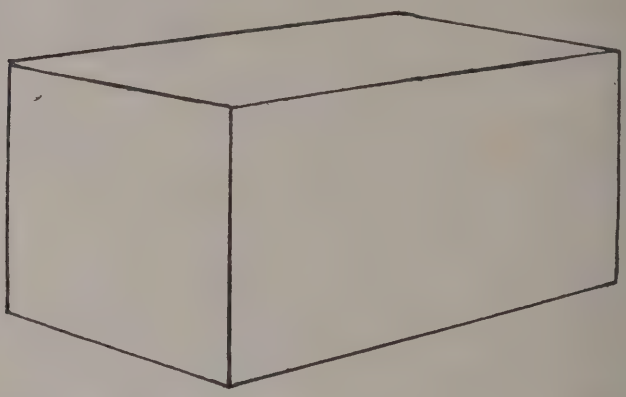
30 (*b.*) Freehand drawing:—

With ruler and set-square draw an oblong 5 inches by 7 inches. In this space draw a design in the form of a scroll and put a suitable border around the oblong.

Value.

25 (*c.*) Freehand object-drawing:—

Make an enlarged drawing of the square prism shown below and then change the drawing so that it shall represent some common object; for example, a book-stand.



24 (*d.*) Geometrical drawing:—

1. Draw a line 4 inches long, and mark off the following distances in the order given: 1 inch; ¾ inch; ½ inch; 1¼ inches. Then draw a line 2½ inches long, and divide it in the same proportion as the first line.
2. Draw a line AB 3½ inches long, and on this line construct a triangle with the angle at A 90 degrees, and the angle at B 60 degrees.
3. Draw a circle having a radius of 2½ inches. Within the circle construct the largest square you can.

(Set-squares not to be used in parts 2 and 3 of question (*d*).)

NATURE LESSONS. (Time, 1½ hours.)

[NOTE.—*Answer the first* three *questions and any* four *of the remaining nine questions.*]

Value.

15 1. (*a.*) What dangers arise from the use of the common drinking-cup, and how can such dangers be overcome?

(*b.*) Mention four of the most common causes of impurities in milk.

(*c.*) What is the one great danger in the drinking of impure water or impure milk, and what measures would you take to make a suspected sample safe for drinking?

15 2. (*a.*) What dangers to health arise from careless sweeping and dusting, and how should this work be done in the home or school-room in order to minimize those dangers?

(*b.*) What is meant by disinfection, and under what circumstances should it be carried out?

(*c.*) Mention some methods used in disinfecting articles.

14 3. (*a.*) What are the three greatest uses of the skin?

(*b.*) "Perspiration fulfils a double purpose." Explain this statement.

(*c.*) What are the values to be derived from regular bathing? Mention some precautions with reference to it.

Value.

14 4. (*a.*) What breed of dairy cattle do you know best? Write a brief description of a cow typical of this breed.

(*b.*) What is the best record you know of for a cow of this breed: (1) In pounds of milk produced in one day, one week, or one year? (2) In pounds of butter produced in one week or in one year?

(*c.*) What would you consider a low percentage and what a high percentage of butter-fat in cows' milk?

14 5. (*a.*) What are the two main classes or types of sheep raised in the Province? Name a breed representative of each of these two types. How would you distinguish one breed from the other?

(*b.*) Name two breeds of swine commonly used for the production of bacon and two that are more suitable for making fat or salt pork.

14 6. (*a.*) Make a drawing not less than 4 inches in length of any bird with which you are familiar; name it and label the parts.

(*b.*) What information would you try to get with reference to a new species of bird which you wished to identify?

14 7. (*a.*) Insects are sometimes divided into two great classes according to the manner in which they take their food. Name the two great classes referred to and give an example of each.

(*b.*) Name a poison or spray mixture commonly used for destroying insects of each of the two classes mentioned, and give reasons why the poison or mixture named by you should be used for the purpose.

14 8. (*a.*) Represent by drawing: (1) The green or vegetative form of the plant known as common horse-tail; (2) the spore-bearing form of it. Show in your drawing the connection that these two forms have in the same plant.

(*b.*) Make a drawing of a spore-bearing fern-leaf and mark the location of some of the spore-cases.

(*c.*) State briefly how a fern-plant is produced.

14 9. (*a.*) Make a drawing of quack or couch grass, showing parts under the ground as well as those above the ground, and explain why this is such a difficult weed to eradicate.

(*b.*) Enumerate the most common methods by which weeds and weed-seeds are scattered through a country.

14 10. Using the scale 1 inch equals 8 feet, draw a plan for a home garden which is to be 40 by 80 feet and which is to include small fruits as well as the usual range of garden crops. Name and show on the plan the location of each variety to be planted.

14 11. Write brief directions on care and management of a garden under the following heads:—

(*a.*) Preparation of the soil for planting.

(*b.*) Precautions to be observed in the planting of garden seeds.

(*c.*) Thinning.

14 12. (*a.*) What gas is given off when small pieces of limestone are placed in a jar containing a weak acid? How would you test this gas to prove your answer correct?

(*b.*) Name the three most important chemical constituents found in all complete fertilizers.

APPENDIX C.

HIGH SCHOOL EXAMINATION, 1921.

Third-class Certificate (Non-professional).

ALGEBRA. (Time, 2 hours.)

Value.

11 1. Factor :—

(*a.*) $108a^3 - 500$.

(*b.*) $x^3 + x^2 + x - y^3 - y^2 - y$.

(*c.*) $a^2 - 4b^2 - 3a - 6b$.

(*d.*) $x(x-2) + y(x-2) - x + 2$.

(*e.*) $x^4 - 7x^2 - 18$.

13 2. Simplify :—

$$\left\{\frac{x + \frac{y-x}{1+xy}}{1 - \frac{x(y-x)}{1+xy}} - \frac{y - \frac{y-x}{1-xy}}{1 - \frac{y(y-x)}{1-xy}}\right\} \div \left\{\frac{y}{x} - \frac{x}{y}\right\}.$$

18 3. Solve :—

(*a.*) $(2x-1)^2 - (x-3)(x-2) = 3(x-2)^2 - 4$.

(*b.*) $\frac{x}{2} - \frac{3y}{4} + z + 1 = 3(x-y) + 5z + 4 = x + 6y - 2z - 9 = 0$.

9 4. Find the H.C.F. and L.C.M. of :—

$x^3 + 6x^2 + 11x + 6$, $x^3 + 7x^2 + 14x + 8$, $x^3 + 8x^2 + 19x + 12$.

12 5. (*a.*) Find the cube root of $1 - 6x + 21x^2 - 44x^3 + 63x^4 - 54x^5 + 27x^6$.

(*b.*) Find the square root of $(2x^2 - x - 3)(x^2 - 4x - 5)(2x^2 - 13x + 15)$.

13 6. A man bought 8 cows and 50 sheep for $900. He sold the cows at a gain of 20% and the sheep at a gain of 10%, receiving in all $1,030. Find the cost of a cow.

10 7. When $x = \frac{ac}{a+c}$, find the value of $\frac{x-2a}{x+2c} - \frac{x+2a}{x-2c} + \frac{4ac}{x^2-4c^2}$.

14 8. A's wages are half as much again as B's, but A spends twice as much as B. If A save $5 and B $10 per week, what are the wages of each per week?

ARITHMETIC. (Time, 2 hours.)

[*All work must be shown. It must be neat and accurate.*]

Value.

12 1. A wholesale merchant bought a car-load of berries for $1,380. He was obliged to sell them at a loss of 12½%. One retailer who purchased $375 worth of berries on credit failed in business and paid his creditors 40 cents on the dollar. Find the wholesaler's total loss.

12 2. A grocer buys 6 bags of Rio Coffee, 125 lb. in a bag, at 12 cents a pound, and 9 bags of Java Coffee, 75 lb. in a bag, at 20 cents a pound. If he makes a mixture of the two kinds and sells it at a profit of 90%, how much does he receive per pound?

12 3. Find the duty on 25,000 cigars, invoiced at $62.50 per thousand, weighing on an average 10½ oz. per box of 50 cigars. The tariff rate is $3 per pound and 25% ad valorem.

12 4. A man borrowed $450 on March 10th at 6%, and $1,200 on April 10th at 5%. He paid both principal and interest in each case on December 30th of the same year. How much did he pay?

12 5. A manufacturer's profit on a bicycle was 20%; the wholesaler's profit was 16⅔%, and the retailer's profit was 25%. If the retailer's selling price was $35, what was the cost of the bicycle to the manufacturer?

12 6. A company paid $3,000 for a hall. During the first year they rented it 148 evenings at $15 an evening. Their expenses were: Coal, 7½ tons at $12.50 per ton; lighting, $31.40; repairs, $78.60; insurance, $18.45; taxes, $47.80. What per cent. did they make on their investment?

12 7. An advertising company constructs a billboard 50 feet long and 10 feet high with boards 1 inch thick. The posts are 12 feet long and 4 inches square; they are placed 10 feet apart. There are three rows of scantling to which the boards are nailed, 3 inches wide and 2 inches thick. Find the total cost of the lumber required if the boards cost $35 per thousand feet, the posts $30 per thousand, and the scantling $25 per thousand.

16 8. My money in the Savings Bank was paying me 3½% interest. I drew out $2,002 and invested it in railroad stock at 125, paying the usual brokerage of ⅛%. This stock yielded a semi-annual dividend of 2½%. Was my semi-annual income increased or diminished, and how much?

BOTANY. (Time, 1½ hours.)

[NOTE.—*Answers should be illustrated with diagrams.*]

Value.

35 1. Write an account of leaves under the following headings, giving examples:—

(*a.*) Compare evergreen and deciduous leaves.

(*b.*) The condition of leaves in buds and during the opening of buds.

(*c.*) The arrangement of leaves in relation to light.

(*d.*) Food manufacture as it is carried on by leaves.

(*e.*) Compare the leaves of a plant belonging to the Liliaceæ with those of a plant belonging to Rosaceæ (using a specific example in each case) with respect to venation, shape, etc.

Value.

30 2. Describe the flower of a plant belonging to the Cruciferæ, *or* Labiatæ. What part in the production of fruits and seeds is taken by each whorl of the flower described?

35 3. (*a.*) Name a plant belonging to each of the families: Cruciferæ, Labiatæ, Compositæ. Describe and compare the corollas of the plants named.

(*b.*) Name a plant belonging to each of the families: Ranunculaceæ, Rosaceæ, Liliaceæ. Compare the carpels of the plants named.

CHEMISTRY. (Time, 2 hours.)

[*All questions are of equal value. Answer any* seven.]

1. Show by means of a drawing how you could obtain nitrogen gas from the atmosphere. What are the chemical and physical properties of this gas?

2. Of what elements is water composed? How can you prove your statement?

3. What relationship exists between the temperature of a gas and its volume? What scientific men were concerned in the discovery of this relationship?

4. What volume of hydrogen, measured at 750 mm. Hg. pressure and 24° C., will be formed by the action of sulphuric acid on 2.55 grams of zinc? 1 litre of hydrogen at 760 mm. pressure and 0° C. weighs 0.09 grams. (Zn = 65.4; H = 1.008.)

5. What do you understand by Gay-Lussac's law of volumes? Illustrate your answer by applying this law to the formation of hydochloric acid from hydrogen and chlorine.

6. What is the difference between a saturated, an unsaturated, and a supersaturated solution? How could you determine the extent to which a salt would dissolve in a given volume of solution?

7. If the formula of copper sulphate is $CuSO_4$, $5H_2O$, what is the per cent. of sulphur and of copper in this substance? (Cu = 63.6; S = 32.06; O = 16.00; H = 1.008.)

8. What weight of ferric oxide (Fe_2O_3) can be prepared from 4.84 grams of iron? What weight of zinc nitrate ($Zn(NO_3)_2$) from 5.55 grams of zinc? (Fe = 55.9; O = 16.00; H = 1.008; Zn = 65.4; N = 14.01.)

COMPOSITION. (Time, 2 hours.)

Value.

60 1. Write any essay on *one* of the following subjects:—

(*a.*) Life in the Village of Auburn.

(*b.*) Byron's Impressions of Rome.

(*c.*) Scott's Love of the Romantic and Picturesque.

(*d.*) Do Moving Pictures Help the High School Student?

30 2. Write a descriptive paragraph of about a page in which you aim to give a *clear* and *pleasing* picture of *one* of the following:—

(*a.*) Sunset on the River Brenta.

(*b.*) The Falls of Terni (Velino).

(*c.*) London From Westminster Bridge.

Value.

10 3. Make necessary corrections in the following sentences and point out the nature of the error in each case:—

(*a.*) He was neither expert in one or the other.

(*b.*) He asked John and I to go with him.

(*c.*) I would deliver your message but have no one who I can send.

(*d.*) Let each esteem others better than themselves.

(*e.*) The landscape was the most gorgeous I ever witnessed.

Third-class Certificate (Non-professional), Full Course.

DRAWING. (Time, 2 hours.)

(a.) Selections from Drawings.

[*The time taken to collect these drawings is not to be deducted from the two hours allowed for this paper.*]

Select the following from your drawing-books, and write your distinguishing number at the top right-hand corner of each. Before beginning your drawing give these to the Examiner.

Value.

6 1. An example of shaded object-drawing.

7 2. An example of painting from nature.

7 3. An example of freehand design.

(b.) Geometrical.

[*All lines used in constructions must be clearly shown.*]

[*Attempt* three only *of the following five questions.*]

10 1. Construct a rhomboid with one side 1½ inches long, short diagonal 1¾ inches long, and one angle 37½ degrees.

10 2. Give the number of degrees in one interior angle (i.e., between two adjacent sides) of the following polygons: Regular pentagon, regular heptagon, regular octagon, regular nonagon, regular decagon.

10 3. A quadrilateral ABCD has the sides AB and AD each 1¾ inches long, BC and DC each 2½ inches long, the diagonal AC 3 inches long. Draw the quadrilateral and inscribe a circle in it.

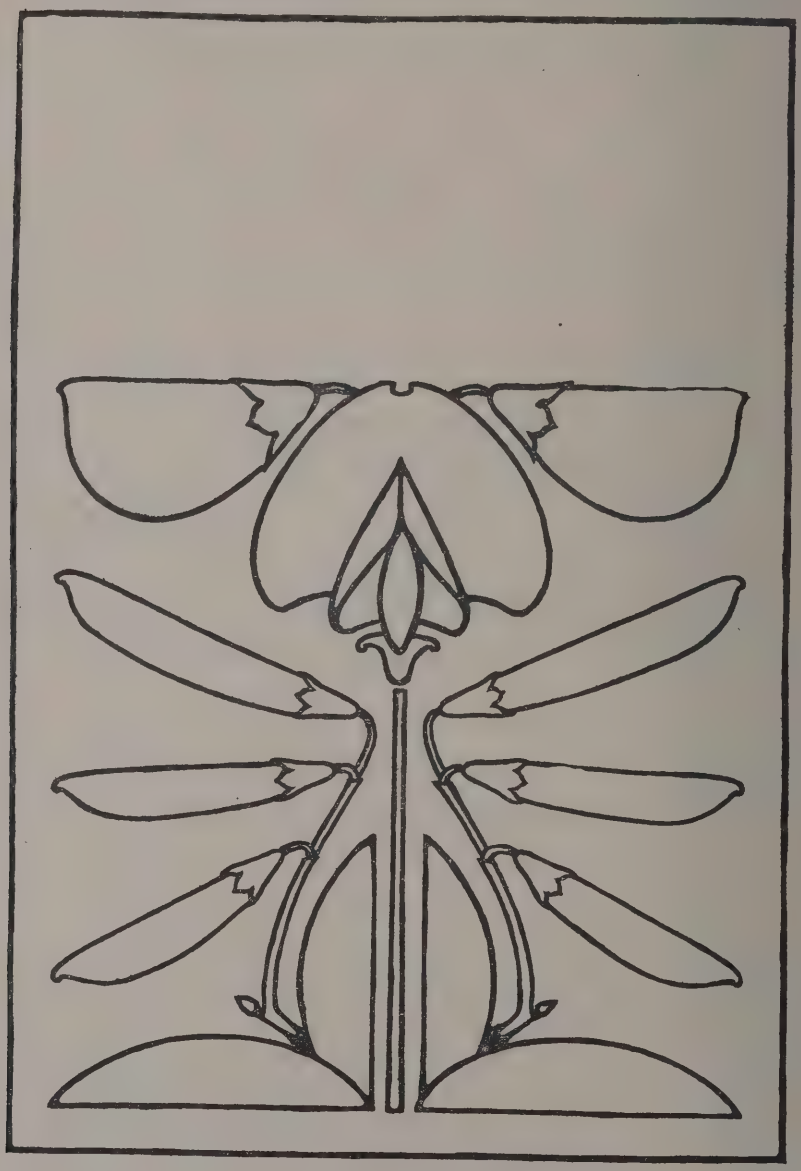
10 4. Construct a rhombus with long diagonal 3 inches long and obtuse angles each 105 degrees.

10 5. Draw any irregular pentagon on a base 1⅞ inches long and construct a similar pentagon having its base 2⅝ inches long.

(c.) Freehand.

Value.

25 Adapt the partly finished book-cover design, given below, to suit a book 8 inches high by 5½ inches wide. Utilize the blank space for the title GARDENS OF ENGLAND. You may use instruments to draw lines to indicate the edges of the cover, as well as to draw guide lines for the title. All other lines must be drawn freehand.



(d.) Object.

25 Draw from memory a group of two or more common objects attractively arranged on a rectangular supporting surface. This drawing should be at least 6 inches wide.

Third-class Certificate (Non-professional).

ENGLISH LITERATURE. (Time, 2 hours.)

Value.

10 1. Quote *any two* of the following:—

(*a.*) Byron's Address to the Ocean (one stanza).

(*b.*) A Sonnet of Wordsworth.

(*c.*) Ozymandias.

(*d.*) The Village Teacher or Preacher (ten lines).

(*e.*) Rosabelle (three stanzas).

30 2. (*a.*)

"The Niobe of nations! there she stands,
Childless and crownless, in her voiceless woe."

(*b.*)

"Thou bringest unto me a tale
Of visionary hours."

(*c.*)

"We look before and after
And pine for what is not."

(*d.*)

"The fiend whose lantern lights the mead
Were better mate than I."

(*e.*)

" . . . it is a curse
To understand, not feel thy lyric flow,
To comprehend, but never love thy verse."

(*f.*)

"Away! away! for I will fly to thee,
Not charioted by Bacchus and his pards,
But on the viewless wings of Poesy,
Though the dull brain perplexes and retards."

(i.) Assign the above quotations to their authors and selections.

(ii.) Explain each passage carefully but briefly.

12 3. Compare the "Ode to a Nightingale" and "To a Skylark," paying special attention to subject-matter and treatment and showing how each poem is characteristic of its author.

14 4. Arnold Bennett has said: "Luxury . . . has nothing whatever to do with happiness." Discuss fully Goldsmith's views on this subject.

14 5.

"For I have been accustomed to entwine
My thoughts with Nature rather in the fields,
Than Art in galleries."

What evidence have you in the "Childe Harold" that this statement is true? Discuss fully.

20 6.

"The beings of the mind are not of clay;
Essentially immortal, they create
And multiply in us a brighter ray
And more beloved existence: that which Fate
Prohibits to dull life, in this our state
Of mortal bondage, by these spirits supplied,
First exiles, then replaces what we hate,
Watering the heart whose early flowers have died,
And with a fresher growth replenishing the void."

(*a.*) Write a careful prose paraphrase of the above stanza.

(*b.*) Write a brief note on the characteristics of Byron illustrated by it.

(*c.*) Give the name of the stanza-form and describe it briefly, scanning lines 8 and 9.

FRENCH (Siepmann, etc., and Fraser & Squair, etc.). (Time, 2 hours.)

Value.

10 1. Rewrite, changing all genders:—

Mon oncle avait donné à son cher neveu un boeuf roux. Ma vieille tante n'en était pas contente, parce qu'elle n'aimait pas ce garçon franc. Elle préférait toujours son autre neveu qui était moins impulsif.

10 2. (*a.*) Construct sentences with the following, expressing the comparison indicated and replacing italicized words by possessive pronouns:—

(1.) *Le cadeau de Charles* est—bon—*mon cadeau* (superiority).

(2.) Ces filles sont—belle—Marie (equality).

(3.) Mon chien n'est pas—grand—*votre cheval* (equality).

(4.) Votre lettre était—amusant—*la lettre de ma mère* (inferiority).

(*b.*) Give the superlative of:—

(1.) Celle-ci est (joli) de toutes les fleurs.

(2.) Voici les livres (intéressant).

10 3. Mon ami lui parle.

Rewrite the above sentence, inserting in turn each of the following expressions:—

(demain-pendant que l'homme travaillait—il écoutera quand—je serais content si—quelquefois—s'il avait été possible—dès qu'il eut reçu la lettre—tout à coup—si cela était vrai—envoyez-moi une lettre aussitôt que—)

5 4. (*a.*) Supply suitable relative pronouns:—

(1.) Voici le garçon—j'ai prêté mon livre.

(2.) Rendez-moi le livre—je vous ai prêté.

(3.) C'est votre frère—me l'a prêté.

(4.) C'est la maison—vous me parliez.

10 (*b.*) Rewrite (substituting personal pronouns for italicized words, and changing the second verb in each instance to the past indefinite tense):—

(1.) C'est *sa soeur* qu'il cherche.

(2.) Parlez *à ses amis.* Il les écoute toujours.

(3.) Accompagnez *votre frère.* Nous le cherchons longtemps.

(4.) Voilà *vos cousins.* Quelles belles fleurs ils apportent!

(5.) Je suis bien content. J'ai reçu *quelques lettres.*

8 5. Repeat the following passage, putting the verbs in the past indefinite (perfect), past definite (preterite), or imperfect, according to the meaning:—

"Georges, (demander) sa mère. Où (être)-tu ce matin? (Acheter)-tu ce joli petit chat?"

Voici l'histoire de son aventure.

Louis et lui (se promener) au bord du ruisseau quand ils (rencontrer) cinq ou six cruels enfants avec un pauvre chat qu'ils (tourmenter). Georges en (être) si fâché qu'il (sortir) tout son argent pour acheter la pauvre bête.

7 6. Put into French:—

(1.) What time is it? (2.) It is half-past twelve. (3.) To-day is the 25th of June. (4.) He gave me half of it. (5.) He set out on Thursday. (6.) How many francs have you? (7.) I have only a hundred.

20 7. Put into French:—

(1.) Finally he returned to France. (2.) She is too young to go to school. (3.) He paid three francs for them. (4.) In spring the birds begin to sing. (5.) Our house was a few yards from the school. (6.) Whose is this hat? It is mine. (7.) The tailor would take your measure. (8.) The tallest in the class are not so tall as they. (9.) Are the children having a good time? (10.) How beautiful those flowers are!

Value.

20 8. Put into English:—

(*a.*) Les événements que nous avons rapportés dessinèrent nettement la position de nos personnages. Craignant de perdre à la fois un chat bien-aimé et les avantages qu'elle ambitionnait, la mère Michel redoubla de vigilance et d'attention. Moumouth, sachant désormais à qui il avait affaire, se promit d'éviter le maître d'hôtel, ou de le combattre, au besoin, des griffes et des dents. Quant au père Lustucru, il suffisait que ses projets eussent été déjoués pour qu'il y persistât avec acharnement; il voulait maintenant la perte du pauvre et innocent Moumouth, non plus seulement par jalousie envers la mère Michel, mais par inimitié contre le chat lui-même.

(*b.*) La mère Michel se tut; mais son parti était pris, et, dès qu'elle eut un moment de liberté, elle courut chez la nécromancienne. Celle-ci montra d'abord quelque embarras à l'aspect de la mère Michel; cependant, après avoir fermé une porte vitrée qui communiquait à d'autres pièces, elle revint saluer sa nouvelle cliente, et dit d'un ton solennel:

"Que désirez-vous?"

"Interroger le présent, le passé et l'avenir."

"Je suis à même de vous satisfaire," repartit madame Bradamor.

GEOMETRY. (Time, 2½ hours).

[*N.B.—Draw neat diagrams, use printed capitals, and give authorities.*]

Value.

14 1. (*a.*) State four cases in which two triangles are equal in all respects.
(*b.*) Prove any *one* of these cases in full.

14 2. In a triangle the perimeter is greater than the sum of the medians.

14 3. If there are three or more parallel straight lines, and the intercepts made by them on any transversal are equal, then the corresponding intercepts on any other transversal are also equal.

14 4. P is a given point within the angle AOB. Draw through P a straight line terminated by OA and OB and bisected at P.

14 5. Parallelograms on the same base and between the same parallels are equal in area.

14 6. To find a point equidistant from three given points, A, B, C, which are not in the same straight line.

16 7. Construct a triangle having given the perimeter and the angles at the base. State your construction and give a theoretical proof.

GERMAN. (Time, 2 hours.)

Value.

12 1. Supply correct endings to the adjectives in the following sentences :—

Der lieblich — Garten gehörte ein — alt — Manne, der unſer — Hauſe gegenüber wohnte. Manch — gut — Apfel hat er mir und mein — Vettern geſchenkt. Viele bunt-Blumen brachte er unſer — Mutter. Etwas Gut — hatte er immer für jen — klein — Mädchen das ihn ſo ſehr liebte. Das waren ſchön — Zeiten.

10 2. (*a.*) Supply the correct article or possessive adjective :—

(1.) Ich wohne bei — Tante. (2.) Er ſtellte ſich hinter — Tür. (3.) Sie kauft das Buch für — Vetter. (4.) Wir fahren morgen nach — Stadt. (5.) Georg ſtand hinter — Bruder.

(*b.*) Rewrite the above sentences, substituting phrases with pronouns for those with nouns.

10 3. Connect the following sentences by means of relative pronoun forms :—

(1.) Das war mein Bruder. Sie haben ihn geſtern getroffen. (2.) Kommen Sie in den Garten. Ich habe ſchöne Blumen darin. (3.) Er hat ſchlechte Augen. Es iſt ſchade. (4.) Kannſt du es mir nicht ſagen? Ich bin dein Freund. (5.) Haben Sie den Mann vergeſſen? Wir haben ſein Haus geſtern geſehen.

5 4. (*a.*) Supply correct forms of demonstrative or interrogative pronouns :—

(1.) Weſhalb haſt du — geholfen, der immer dein Feind geweſen iſt? (2.) Er hat von Goethe und Biſmarck geſprochen; — war Dichter, — Feldherr. (3.) — ſind dieſe Manner? (4.) — Hund is das? (5.) Erinnern Sie ſich — nicht?

10 (*b.*) Put into German :—

(1.) What weather! What a storm! (2.) Which one is your brother? (3.) That sort of thing often happens. (4.) This is my book, not my wife's. (5.) I don't like men of that kind.

12 5. Change the verbs in the following sentences to *present* and *perfect* indicative :—

(1.) Der Junge lief nach Hauſe. (2.) Paul wurde müde. (3.) Sie ließ das Buch binden. (4.) Was fraß d[illegible] arme Tier? (5.) Karl ſaß vor der Tür? (6.) Was geſchah geſtern?

4 6. (*a.*) Put into English :—

(1.) Das läſſt ſich leicht machen. (2.) Das Eis will brechen. (3.) Was ſoll das? (4.) Wie dem auch ſein mag.

8 (*b.*) Put into German :—

(1.) I should like to have seen that. (2.) They are said to be very rich. (3.) You should have helped your brother. (4.) He claims to have been here at that time.

9 7. Put into German :—

(1.) Somebody is knocking. (2.) I give the best that I have. (3.) Come at six o'clock on the first of July. (4.) This boy reads best. (5.) He cut his finger. (6.) Let us set out. (7.) How are you today? (8.) Is that you, Ernest? (9.) What has become of them?

20 8. Put into English :—

(*a.*) Heute Ubend waren die zwei älteſten Kinder etwas ausgelaſſen; das eine hüpfte auf einem Beine in ſeinem langen weißen Nachthemdchen, das andere ſtand auf einem Stuhl, umgeben von den Kleidern aller andern Kinder, es ſagte, es wären lebende Bilder. Das dritte und das vierte legten die Wäſche fein

Value.

ordentlich in das Käſtchen, und das muß auch gemacht werden; die Mutter aber ſaß an dem Bette des kleinſten und bedeutete allen, daß ſie ſchweigen ſollten, denn die kleine Schweſter würde das Vater-unſer beten.

(*b.*) Es war mehr als vierzehn Tage her, daß der Mond nicht geſchienen hatte, jetzt ſtand er rund und hell da über den langſam ziehenden Wolken. Höre, was der Mond mir erzählte: „Von einer Stadt in Fezzan aus folgte ich einer Karawane; vor der Sandwüſte auf einer der Salzebenen, die wie eine Eisfläche glänzte und nur ſtellenweiſe mit leichtem Flugſande bedeckt war, wurde halt gemacht.

(*c.*) Dabei machte er ſich nun ſeine Gedanken. Ach! wenn er doch auch das Spinnrad drehen dürfte. Der Vater und die Mutter ſchliefen, er ſah ſie an, ſah das Spinnrad an und kurz darauf guckte ein kleiner nackter Fuß zum Bette heraus, nnd dann noch einer, und dann zwei Beinchen. Da ſtand er. Er ſchaute ſich nochmals um, ob Vater und Mutter auch noch ſchliefen; ja, ſie ſchliefen; und nun ſchlich er leiſe, ganz leiſe, in ſeinem kleinem kurzen Hemde zu dem Spinnrade hin nnd fing an zu ſpinnen.

LATIN. (Time, 2 hours.)

Value.

5 1. Decline in the singular: *spes, pedes, vulnus, fructus, illō* (neuter).

5 2. Decline in full: *qui* (all genders) and *fortior.*

10 3. Compare: *inferus, altus, multus, prudens, nobilis, bene, magnopere, facilis, aeger, malus.*

8 4. What is a Deponent verb? In what tenses does it retain an active formation? Exemplify your answer.

12 5. Give the ordinal numerals from one to ten inclusive, and the cardinals for 20, 30, 40, 50, 60, 70, 80, 90, and 777.

10 6. Conjugate in full:—

(*a.*) Present indicative passive of *rego.*

(*b.*) Present indicative of *patior.*

(*c.*) Present subjunctive of *volo.*

(*d.*) Future indicative of *possum.*

(*e.*) Imperfect subjunctive of *nolo.*

10 7. Give the Latin for:—

I establish friendship; he pitched a camp; to Rome; on the next day; a revolution; provisions; the seventh legion; in the middle of the river; he promised to go there; in the rear.

16 8. Translate into Latin:—

(*a.*) When the signal was given, Caesar joined battle.

(*b.*) Caesar ordered Ariovistus not to bring any infantry to the conference.

(*c.*) After delaying there a few days to secure supplies, he discovered that his soldiers were unwilling to advance.

(*d.*) So great was the valor of the soldiers that the enemy turned and fled.

9. Translate into English:—

Value.

8 (*a.*) Helvētiī proximī sunt Germānīs, quī trāns Rhēnum incolunt; reliquōs Gallōs virtūte *praecēdunt*, quod ferē cotīdiānīs proeliīs cum Germānīs contendunt. Sed undique locī nātūrā continentur: ūnā ex parte est flūmen Rhēnus altissimus et lātissimus; alterā ex parte mōns Jūra altissimus; tertiā ex parte flūmen Rhodanus nostram prōvinciam ab Helvētiīs *dīvidit*. Hīs dē causīs Helvētiī nōn lātē vagārī poterant, nec facile fīnitimīs bellum *īnferre*.

Give the principal parts of the verbs printed in italics.

8 (*b.*) Ubi eum castrīs sē tenēre Caesar intellexit, nē diūtius commeātū *prohibērētur*, ultrā eum locum ubi Germānī cōnsēderant, circiter passūs sescentōs ab iīs, castrīs idōneum locum dēlēgit, aciēque triplicī *īnstrūctā* ad eum locum vēnit. Prīmam et secundam aciem in armīs *esse*, tertiam castra mūnīre jussit.

Give the construction of the verbs printed in italics.

8 (*c.*) Ulixēs simul ac vōcem audīvit adulēscentem esse deum Mercurium sēnsit; nūllō tamen modō ab cōnsiliō dēterrērī potuit. Quod cum Mercurius sēnsisset, herbam quandam eī dedit, quam contrā carmina plūrimum valēre dīcēbat. "Hanc cape," inquit, "et ubi Circē tē baculō tetigerit, dēstrīctō gladiō, impetum in eam fac."

Express *gladio destricto* by some other Latin construction.

PHYSICS. (Time, 2 hours.)

Value.

4 1. (*a.*) Define Physics.

10 (*b.*) If the mass of one cu. cm. of air is 0.001293 gm., find the number of kg. of air in a hall 30 metres long, 15 metres wide, and 6 metres high.

6 (*c.*) Name and briefly explain the fundamental units of mass, length, and time in both the Metric and British systems.

6 2. (*a.*) What is the difference in the manner of transmission of pressure by fluids and by solids? State the law regarding pressure by fluids.

4 (*b.*) To what is pressure in fluids due? Upon what does the amount of pressure depend?

10 (*c.*) What is the pressure on the base of a vessel 15 cm. square if filled with benzine to a depth of 12 cm.? (Specific gravity of benzine 0.9.)

10 3. (*a.*) Explain clearly the three modes of heat transference and mention six applications of these principles in our daily life.

10 (*b.*) How would you proceed to make and graduate a Centigrade thermometer? Why is mercury a good liquid for thermometers?

10 4. (*a.*) Describe an experiment to show that a medium is required to transmit sound-waves. Name five substances that will transmit sound-waves.

10 (*b.*) How many metres distant is an aeroplane if the report of a gun fired from it is heard four seconds after the flash is seen? (Average temperature 15° Centigrade.)

5 5. (*a.*) Define Buoyancy. What is the cause of buoyancy in fluids?

5 (*b.*) Why will an iron ship float while a piece of iron of which it is made will sink?

10 (*c.*) A block of pine has a mass of 24 gm. and a volume of 40 cu. cm. What fraction of the block would be immersed if floating in water? What volume of the block if floating in an acid having a relative density of 1.5 gm. per cu. cm.?

PHYSIOLOGY. (Time, 1½ hours.)

[NOTE.—*Answers should be illustrated with diagrams.*]

Value.

35 1. (*a.*) Trace, briefly, the circulation of the blood.

(*b.*) What part is taken by the blood in the work of nutrition, respiration, and excretion? Why does life cease almost immediately after the heart stops beating?

30 2. (*a.*) Describe the structure of the skin.

(*b.*) Of what importance is the skin in the economy of the body; that is, what work does it perform?

(*c.*) Name three diseases of the skin; give causes, symptoms, and control or cure.

35 3. (*a.*) Briefly describe the nervous system under the headings: Brain, spinal cord, nerves, sympathetic ganglia, and sense-organs.

(*b.*) Describe one of the sense-organs in detail and show how it is related to the central nervous system.

Third-year Course, Commercial.

ARITHMETIC. (Time, 2 hours.)

B. General.

[NOTE.—*The time allowance for Arithmetic, Third-year Course, Commercial, is 2½ hours; after the expiration of 30 minutes, answers to Section A (Rapid Calculation) will be collected, and Section B (General) will then be distributed to candidates.*]

[*All questions of equal value.*]

1. Arrange the following fractions in ascending order of magnitude:—

$$\frac{5}{8}, \quad \frac{105}{163}, \quad \frac{151}{230}, \quad \frac{2211}{3535}.$$

Show your work or explain your method.

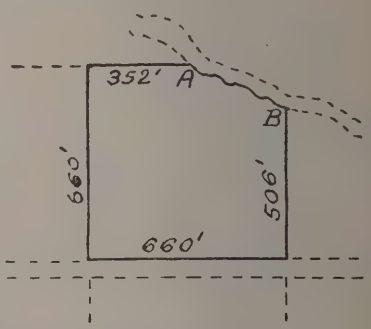
2. The travelling salesman for a Vancouver Wholesale Grocery Company is paid according to the following agreement: $200 per month, and 5% of his sales for the month over $8,000. His monthly sales for the year 1920 were:—

January	$9,600 00
February	8,980 00
March	9,210 00
April	9,210 00
May	8,500 00
June	8,110 00
July	7,540 00
August	6,870 00
September	8,620 00
October	10,750 00
November	9,857 00
December	8,993 00

What is his total salary for the year?

3. As accountant for the Burrard Milling Company you find on hand November 30th, 1920—at the end of your fiscal year—two notes, one from J. H. Black for $730, dated July 3rd, 1920, at 8 months; the other from Murray and Wilson for $475, dated September 17th, 1920, at 6 months and bearing interest at 7%. If the security is satisfactory, what valuation should you place on these notes when preparing a statement of assets?

4. About how many acres are there in this piece of land? What is, approximately, the distance from A to B?



5. The books of the Bruce and Howard Hardware Company show the following:—

Value of stock on hand January 1st, 1920 (valuation taken at cost)		$12,800 00
Purchases for 1920	$27,500 00	
Less returns	690 00	
		26,810 00
Sales for the year 1920	$43,250 00	
Less returns	730 00	
		42,520 00
Value of stock on hand December 31st, 1920 (valuation taken at cost)		15,375 00

Determine:—

(*a.*) The cost of the goods sold.

(*b.*) The gross profit of the business for the year.

(*c.*) The percentage gain on "turnover."

What other considerations have to be taken into account in determining the net profit?

6. A gasoline drum (cylindrical) is 32 in. long and 22 in. in diameter, inside measurements. How many gallons of gasoline will it hold? If the drum itself weighs 76 pounds, and the specific gravity of the gasoline is .74, what will be the total weight of the drum and gasoline?

7. A mortgage for $2,500, bearing interest at 7% per annum payable yearly, has three years to run. How much should a purchaser pay for this in order to make 8% per annum on his investment?

8. The "Gross Takings" (or income from sales) of the Columbia Sheet Metal Works have to be divided as follows:—

	Totals.	Division of the Sales Dollar.
Cost of Raw Material	$29,560 00	
Cost of Manufacturing	19,492 00	
Cost of Administration	16,250 00	
Net Profit	10,795 00	
Gross Takings		$1 00

In order to show more clearly what becomes of the "Takings," express in tabular form the number of cents out of each dollar of "Takings" that have to be allotted to each of the four items named.

ARITHMETIC. (Time, 30 minutes.)

A. Rapid Calculation.

[NOTE.—*The time allowance for Arithmetic, Third-year Course, Commercial, is 2½ hours; after the expiration of 30 minutes, answers to Section A (Rapid Calculation) will be collected, and Section B (General) will then be distributed to candidates. Candidates will complete their work on this sheet and hand it in; no other work is necessary.*]

[*All questions of equal value.*]

1. Add:—

48673
29848
96276
37589
64876
43734
97849
86897
42678

24	Dining Chairs, No. 412	6.35	
9	Oak Rockers, No. 435	16.25	
6	Oak Desks, No. 746	23.75	
5	Library Tables, No. 132	21.25	

4. The following table shows the legal weights per bushel:—

Wheat	60 lb. per bushel.	Oats	34 lb. per bushel.
Barley	48 „ „ „		

Find the cost of:—

63,500 lb. Wheat @ $1.60 per bush.	
78,400 lb. Barley @ .80 „ „	
31,500 lb. Oats @ .44 „ „	

5. Total the following invoice, and find the cost, in Canadian currency, of a draft purchased at 4.85 to pay it:—

£	s.	d.
42	11	6
127	3	8
58	2	9
11	15	10

Cost of draft, $.....

6. Correct the errors in the following:—

BRITISH COLUMBIA DRY GOODS COMPANY.

Profit and Loss Statement for 1920.

	Dry-goods Department.	Shoe Department.	Men's Wear Department.	Totals.
Sales	$165,780	$96,370	$142,960	$405,110
Goods returned	630	250	610	1,490
NET SALES	165,150	96,120	142,350	403,620
Cost of Goods	100,740	70,015	96,370	268,125
GROSS PROFIT	64,410	25,105	45,980	135,495
Overhead Charges	16,480	7,216	10,860	34,556
NET PROFIT	47,930	17,889	35,120	100,939

ACCOUNTANCY PRACTICE. (Time, 3 hours.)

[NOTE TO PRESIDING EXAMINER.—*Please provide candidates with journal and ledger paper.*]

Value.

20 1. As accountant for the Western Trading Co. show how you would record the following transactions in a Cash Book containing special columns for Cash, Bank, Discounts, Cash Sales, Expense, and any others you please:—

(i.) Balances—Cash, $25. On deposit, $1,250.

(ii.) Traveller's memo:—Collected the following: Cheque from J. Brown for invoice No. 131, $300 less 3%. Postal orders from F. White for $115. Cash from L. Green, $25. From W. Weir, cheque to pay account of $145 with 2% deducted. From J. Thomas, cash in full of account of $175 with $3 allowed off. Traveller deducted $47.50 from cash received as his expenses and handed you the balance. The $3 allowed J. Thomas was an error and you deducted it from traveller's salary of $75 and gave him cheque for balance. You deposited all cash, exchange on cheques, ¼ of 1%.

(iii.) Cash sales, $124.65. Paid Small & Co.'s account of $400 less 3% by cheque.

(iv.) Discounted W. May's note for $120, discount $1.45, proceeds deposited.

(v.) Prepaid firm's note of $300, discount $2.50, by cheque.

Balance and close the Cash Book.

20 2. Ames and Bragg are partners. Ames invested $20,000 and withdrew $2,500. Bragg invested $10,000 and withdrew $1,200 during the year; Ames and Bragg to receive $1,500 and $1,000 salaries respectively, and each to receive 6% interest on his net investment; Losses or gains to be divided ⅔ to Ames and ⅓ to Bragg. Their books, recorded by single entry, exhibit the following results at the end of one year:—

Cash on hand, $110; On deposit, $990; Stock on hand, $25,410; Notes on hand, $2,100; Notes outstanding, $5,400; New Building, $20,000; Mortgage on same, $7,000; Debtors, $10,389; Creditors, $15,000.

Show the partners' Accounts properly closed at the end of the year.

15 3. Ames and Bragg are joined by Cowan, Duncan, and Elliott, and organize a Joint Stock Company capitalized at $40,000 to carry on the above business, Ames and Bragg together to receive $32,900 fully paid stock for their interest in the business, any fractional amount due to either of them to be paid in cash. Cowan subscribes 15 shares; Duncan, 25 shares; and Elliott, 20 shares, respectively, and pay 50% in cash.

Give the necessary Journal entries to open the books of the Company.

20 4. Give the Journal entries for the following transactions:—

(*a.*) A. L. Benson has made an assignment in favour of his creditors, who receive 65c. on the dollar. We receive a cheque for $650 in settlement of our claim.

(*b.*) At the close of the financial year a firm has book debts to the value of $8,650. Provide a sum equal to 6% of this amount for possible bad debts.

(*c.*) R. L. Smith owns a business in which his net capital is $4,000. R. Bennett buys a half-interest by investing $800 in the business and paying Smith personally $2,500.

(*d.*) A Company ends its financial year with a net profit of $8,464. The directors declare a Cash Dividend of 8% and a Stock Dividend of 5% on a paid-up Capital of $40,000. The balance of Profits are placed in a Reserve Account. The required cheques and stock certificates are issued.

Value.

25 5. From the following data prepare:—

(*a.*) Trial Balance.

(*b.*) Trading Account.

(*c.*) Profit and Loss Account.

(*d.*) Statement of Assets and Liabilities.

(*e.*) Statement of Distribution of Profits.

Goods on hand Jan. 1, 1920, $12,000; Purchases, $70,000; Sales, $86,000; Expenses, $2.500; Wages, $6,100; Cash on hand, $45; Cash in bank, $3,905; Salaries, $1,250; Rent, $900; Commission paid, $75; Sales rebates, $750; Sales discounts, $400; Purchase credit notes, $400; Purchase discounts, $560; Machinery, $11,000; Book debts, $8,000; Creditors, $7,000; Notes on hand, $2,000; Notes outstanding, $850; Interest on deposits, $100; Office furniture, $600; Repairs, $50; Freight, $200; Duty, $150; Advertising, $1,200; Discounts allowed, $200; Profit and Loss account credit, $1,415; Capital Stock, $25,000.

Inventories.

Stock on hand, $18,500; Advertising prepaid, $60; Wages unpaid, $300; Rent unpaid, $200; Depreciation on machinery 10%, on Office furniture 10%. Provide 8% of Accounts receivable for bad debt reserve.

The Directors instruct you to pay a cash dividend of 8% from Undivided profits account.

ACCOUNTANCY THEORY. (Time, 2 hours.)

Value.

10 1. State briefly the difference between Single and Double Entry systems of Bookkeeping. Which do you prefer? Give your reasons.

15 2. A. Johnston's account on your books shows a debit balance of $1,095. You draw on him at 90 days' sight. The draft is accepted June 1; 1921. On June 16th you discount the draft at the Bank at 8% and deposit the proceeds.
Give the necessary Journal entries to record these transactions.

10 3. How would you deal with items accrued and unpaid (such as rent, commission, wages) when closing the accounts of a business?

10 4. Give the ruling for a Stock or Share Ledger for a Limited Company. Show entries recording stock subscribed, calls paid, and stock transferred.

10 5. Explain the method by which the net result of a double entry Profit and Loss Account may be proved by the use of the Asset and Liability Statement.

6. Give Journal entries to show how you would record:—

5 (*a.*) The receipt of a consignment of apples on which you have paid freight charges by cheque.

5 (*b.*) The sale of the consignment, for which you have received in payment a sight draft, your own note taken at a discount, and an order on Henry Jones for the balance.

10 (*c.*) The closing of the consignment and the rendering of the account sales, charging commission and storage; and remitting the sight draft received above, the order on Henry Jones, and your cheque for balance.

Value.

15 7. Give the main reasons for the use of: (i) A Special Column Cash Book; (ii) A Synoptic Cash Journal; (iii) Self-balancing Ledgers; (iv) Triplicate Sales Invoice; (v) Bank Reconciliation Statement.

4 8. (*a.*) Rule a Purchase Book suitable for a business having three departments.

6 (*b.*) Name the books you would require for a limited company conducting a trading as well as a shipping and commission business.

BUSINESS CORRESPONDENCE. (Time, 2 hours.)

[NOTE TO PRESIDING EXAMINER.—*Please provide candidates with plain white letter paper.*]

[*Candidates may use either pen and ink or typewriter for any portion of their work.*]

Value.

17 1. Write a letter to a delinquent customer enclosing statement of account for $250. Review the facts, and ask for prompt attention and payment. Be courteous but firm.

15 2. 707 Granville St., Vancouver, B.C., March 18th, 1921. Edward J. Wells, Esq., 996 Broadway West, Vancouver, B.C. Dear Sir:—The insurance on your two-story frame dwelling, situated at 1002 Twelfth Ave., for $1,200, with the Aetna Fire and Marine Insurance Company, expires on March 28th.

Please send us your instructions in regard to the renewal of this policy.

We do not wish to leave our clients unprotected, but we cannot renew insurance unless we are directed to do so. Fuller, Denver and Company. J. R. Chelsea, Manager, Insurance Department.

Write a reply to this letter.

17 3. (*a.*) A lumber dealer in Calgary ordered from the Great West Lumber Company, Vancouver, a carload of No. 1, 4-in. fir flooring. In due time he received the shipment and the invoice therefor, but on examination found the flooring to be knotty and sappy.

Write a letter of complaint, making, however, some suggestions and a proposition as to a settlement of this difficulty.

17 (*b.*) Write the Great West Lumber Company's reply.

17 4. Name a line of business and state an oft-occurring event in connection therewith that would justify the use of a "form paragraph" in the correspondence. Write out a good form paragraph to be used under the circumstances.

17 5. "It is seldom that one finds a business in which some use is not made of a booklet, catalogue, or folder, and often the preparation of such material is left to the correspondent."

Describe the various considerations that enter into the issuing of a booklet or catalogue, and explain in logical order the different steps in its preparation.

Or

What is a circular letter?

Why are circular letters freely used?

State the general uses of such letters.

Describe the various points to be observed in the preparation of a circular letter.

Write a circular letter for *one* of the following purposes:—

(*a.*) Calling a meeting of the grocers of your town to discuss the question of uniform hours of opening and closing and a weekly half-holiday for employees.

(*b.*) Announcing to out-of-town customers a special sale of gloves.

(*c.*) On behalf of the law firm of Baker and Jackson, who make a specialty of collections, soliciting accounts for collection.

ECONOMICS AND CIVICS. (Time, 2 hours.)

Value.

6 1. (*a.*) Briefly outline the events as they occurred in the development of the industrial organization of England, which is known as the "Industrial Revolution."

4 (*b.*) Mention some new economic factors which appeared as a result of these changes.

2. Discuss the economic relations between Price and Value under:—

6 (i.) Considerations which determine Value.

6 (ii.) Considerations which determine Price.

3 3. (*a.*) Explain clearly what is meant by "Production."

8 (*b.*) Name the various factors which co-operate in the process of production and tell what each contributes in making the finished product.

5 (*c.*) What do you mean by the "Expenses of Production"?

3 4. (*a.*) What do Economists mean by the term "Distribution"?

6 (*b.*) Upon what principle do they advocate that distribution should be based? Explain.

5 (*c.*) How far is this principle adhered to under present economic conditions?

8 5. (*a.*) Applying your knowledge of the principles of Economics, explain as fully as you can:—

(i.) The causes of present unemployment.

(ii.) The reasons for the high rate of exchange between Canada and the United States.

10 (*b.*) Write brief explanatory notes on the following: Marginal Utility and Disutility; the Law of Diminishing Returns; Competitive Profits; Real Income; the Origin of Labour Unions.

7 6. (*a.*) Give your reasons why the Federal System of government is most suitable for Canada.

10 (*b.*) Outline the various subjects which are under the control of:—

(i.) The Federal Government.

(ii) The Provincial Government.

(iii) The Municipal Government.

5 7. (*a.*) Describe fully how the machinery of government is carried on by means of the Party Government System.

5 (*b.*) Explain fully how the revenue of the country is obtained by (i) Direct Taxation, (ii) Indirect Taxation.

3 (*c.*) What is meant by a "Protective Tariff"?

LAWS OF BUSINESS. (Time, 2 hours.)

Value.

4 1. (*a.*) Define a Contract. Give the main points requisite to a valid Contract.
(*b.*) Give your opinion on the legal points of the following transactions with reasons for your answers, quoting the Statutes where possible:—

4 (i.) A offers B a horse for $200 and agrees to give him until next evening to consider. In the meantime A sells the horse to C. B sues for breach of Contract. Will he succeed?

4 (ii.) X buys an automobile from Y for $1,300 on the understanding that he pays $100 a month. After making the first payment X returns the automobile. Can Y force him to pay?

4 (iii.) A goes with B to a bank and says, "Advance B $1,000 as a loan, and if he does not pay it I will." If B fails to pay can the bank collect from A?

4 2. (*a.*) In what respects does a Chartered Bank differ from: (i) A Private Bank; (ii) A Trust and Loan Company?

3 (*b.*) Explain how the Bank Act guards against loss to the public through banks becoming insolvent.

4 (*c.*) Compare the security given depositors with that given note holders.

4 3. (*a.*) What is meant by the Statute of Limitations? Why was it enacted?

4 (*b.*) How may a Statute-barred debt be revived? How would you use this knowledge to prevent an item in a book account being outlawed?

2 (*c.*) What debts are not affected by this Statute?

4 4. (*a.*) Define Partnership. State the two prime tests of Partnership.

8 (*b.*) Describe fully the four kinds of Partners under: (i) Name; (ii) Investment; (iii) Liability; (iv) Place in firm; (v) Share in results.

4 (*c.*) Smith, a special partner, while on a pleasure trip, takes advantage of an opportunity and buys the stock of a bankrupt firm. What effect will this have on his legal standing as a partner?

4 5. (*a.*) Henderson buys from you some household furniture for $650 and offers you a note at six months or a Chattel Mortgage. Which would you accept? Give reasons for your answer.

4 (*b.*) What steps would you take to maintain your security under a Chattel Mortgage: (i) If the Mortgagor removes the property to another district; (ii) If the Mortgagor fails to pay at maturity?

4 (*c.*) In a Mortgage on real estate explain what is meant by: (i) Foreclosure; (ii) Personal Covenant.

5 6. Adams sells Brown a typewriter for $200, which amount is to be paid in ten equal monthly payments, the first payment to be made on July 1st. Adams instructs you, as his book-keeper, to write a promissory note to meet these conditions and giving him the right to resume possession of the machine in case Brown fails to meet his payments. Write the note.

4 7. (*a.*) State the advantages that a business, which has been carried on as a Partnership, gains by incorporating as a Joint Stock Company.

8 (*b.*) Compare the Liability of: (i) A General Partner; (ii) A Special Partner; (iii) A Shareholder in a Bank; (iv) A Shareholder in any other Joint Stock Company.

Value.

5 (*c.*) Explain what is meant by: (i) Authorized Stock; (ii) Subscribed Stock; (iii) Watered Stock; (iv) Preferred Stock; (v) Stock Dividend.

5 8. (*a.*) You have completed arrangements for the purchase of a house and lot in Vancouver. State in detail what steps you would take to satisfy yourself that the vendor can give you a clear title.

3 (*b.*) Explain what is meant by: (i) An Indefeasible Deed; (ii) A Quit Claim Deed; (iii) A Tax Sale Deed.

5 (*c.*) State fully the advantages of the Torrens System of Land Transfer.

UNIVERSITY OF ILLINOIS LIBRARY

PENMANSHIP. (Time, 1 hour.)

1. Make one copy:—

"Although we interviewed many applicants, few of them seemed to possess anything but a superficial knowledge of business letter writing. Even applicants who had had considerable experience in correspondence work seemed to think that the only requirement was to dictate grammatically, to master routine quickly, and to learn the various prices, terms, adjustments, and other facts and information requested by customers. They didn't seem to comprehend the finer points of business-building letters.

"If we had been able to find a dozen top-notch correspondents with an appreciation of the true possibilities of business letters, they could practically have named their own salaries.

"Competent correspondents seemed so scarce that we finally decided to establish a systematic course of training for all new correspondents, in order to give them a clearer understanding of the broad principles of letter writing, and to teach them not to use unnecessary words, stilted expressions and rambling phrases, but to give their letters personality and a touch of human interest which would drive them straight to the mark, creating friendly feeling and good will wherever they were read.

"We had to show these people that their job was not simply to 'handle correspondence' and to clean up their desks at the end of the day, but that their task was to develop new markets, to bring back old customers who had drifted away, to collect money from accounts long past due, to keep up the fighting spirit of our salesmen on the road, and to turn complaints into orders.

"So we organized a class ———"

(System.)

2. Write one line of each of the following: (8.), %, +, @, ;, #, c, —, $, *, ?, (a.) &.

3. Make one copy:—

The sources and the value of Canadian imports for the year 1918 are shown in the following table:—

By Countries.	1918.
United Kingdom	$ 72,879,109
Australia	6,084,963
British East Indies	17,026,095
British Guiana	5,088,972
British South Africa	1,331,842
British West Indies	8,930,109
Hongkong	2,343,958
Newfoundland	3,287,340
New Zealand	7,014,313
Other British Empire	1,371,069
Argentine Republic	1,726,489
Brazil	1,128,616
China	1,867,405
Cuba	2,034,654
France	3,754,761
Italy	642,071
Japan	13,184,893
Netherlands	582,507
United States	738,142,064
Other foreign countries	18,533,670

4. Make one copy:—

DIRECT FOREIGN BANKING FACILITIES.

South and Central America, Cuba and the West Indies.

We have *direct* connections with the leading financial institutions in Argentina, Uruguay, Chile, and Brazil, and have, in addition, a special representative in Buenos Aires. We cover other countries of South America, Central America, and the West Indies, through our affiliated institution, the Mercantile Bank of the Americas, which has branches and connections as follows:—

COLOMBIA—Banco Mercantil Americano de Colombia: Bogota, Barranquilla, Cartagena, Medellin, Manizales, Girardot, Cali, Honda.

PERU—Banco Mercantil Americano del Peru: Lima, Arequipa, Chiclayo, Callao.

VENEZUELA—Banco Mercantil Americano de Caracas: Caracas, La Guayra.

BRAZIL—American Mercantile Bank of Brazil: Para, Pernambuco.

NICARAGUA—National Bank of Nicaragua: Managua, Bluefields, Leon, Granada.

HONDURAS—Banco Atlantida: La Ceiba, Tegucigalpa, San Pedro Sula, Puerto Cortez.

CUBA—Banco Mercantil Americano de Cuba: Havana.

Agencies in Ecuador, Bolivia, Costa Rica, Salvador, Guatemala.

SHORTHAND DICTATION.

[NOTE TO PRESIDING EXAMINER.—*Please provide candidates with plain white letter paper and No. 7 envelopes.*]

[NOTE.—*The Examiner will read each section twice; first, rapidly, and secondly, at the rate of one hundred and thirty words per minute. Candidates will write at the second reading only. When all the dictation has been given, the candidates will make either a typewritten or a pen and ink transcription of their notes and enclose each letter in a separate envelope, on which must be placed the proper address as if for mailing. The time required by each candidate for making the transcription will be noted by the Presiding Examiner. Both shorthand notes and transcription are to be handed in.*]

Value.

13 1. Victoria, B.C., June 15, 1921. Mr. J. N. Hudson, Nanaimo, B.C. Dear Sir: We have your inquiry of the 12th and are mailing to you under another cover a (32) catalogue of our various products. The prices listed in the catalogue are those at which the machines are sold to users.

Our local agent, Mr. S. E. Richards, will call upon you in (65) a short time to assist you in the selection of a machine that will meet your requirements. Yours very truly (85).

28 2. Vancouver, B.C., February 10th, 1921. Mr. Howard B. Allen, 400 Miller Ave., Calgary, Alta. Dear Mr. Allen: We are enclosing a statement against the Keystone Power Company, 1142 (32) Manitoba Street, your city, in the amount of $935, which we shall ask you to proceed to collect unless you hear from us by wire by 11 o'clock Monday (65) morning. Our reason for asking this slight delay is that a remittance may possibly come to hand Monday morning. If it does, we would not care to have the account presented to (97) them through your office. We shall wire you early Monday morning if a cheque is received. If you do not hear from us by 11 o'clock, kindly follow the matter up in the (130) usual manner.

These people were always prompt in their payments, but have repeatedly ignored our recent letters and have given no explanation whatever for their delay in remitting. Our relations with them (162) have always been most friendly, but their attitude does not leave any other course than this open to us. Very truly yours (184).

12 3. Kelowna, B.C., May 19, 1921. Miss Julia Henderson, The Jack Pines, West Bank, B.C. Dear Madam: We are informed by the Peterborough Canoe Company that you have written them (32) concerning their canoes.

We are the sole agents in this locality for their product and have just received a full line of their new canoes. We shall be pleased to have you call (65) and look them over. Kindly inquire for Mr. Shepard when you come in. Yours very truly (81).

19 4. Vancouver, B.C., October 18, 1920. Messrs. Stone and Mason, Bank of Hamilton Building, City. Gentlemen: A reinspection of the electrical equipment in premises located at 876 King Street (32) was made on October 15, 1920. Our inspector reported the equipment defective and recommended the changes noted on the attached sheet.

The hazard of electricity, when used on a defective installation, is (65) such that unless the improvements recommended are made within the next thirty days, we shall be compelled to recognize the hazard in your insurance rate.

The changes recommended should be made by (97) a responsible electrician. We trust that we shall hear from you within a few days to the effect that the changes referred to will be made without delay. Yours very truly (128).

28 5. Montreal, P.Q., June 11th, 1921. Mr. James M. Taylor, Nelson, B.C. Dear Sir: Please write frankly and let us know what you think of Municipal Bonds as an (32) investment for your own needs. Some people believe that they can afford to take speculative chances with their money.

Personally, we do not believe in investing money in a speculative security which is (65) sometimes called "a business man's investment." Why a business man should be supposed to find it desirable to lose his money any more than a widow or an executor of a trust (97) fund, we fail to understand. An investment is either safe or it is, at least to some degree, unsafe.

We are extremely desirous of establishing business relations with you because we know Municipal (130) Bonds are safe and our clients will never have occasion to reproach us in the future. You may not be in the market at present, but we would like to hear from (162) you so that we could feel that we have convinced you of the merits of Municipal Bonds. Yours very truly (182).

STATUTE LAW. (Time, 2 hours.)

Value.

5 1. (*a.*) Explain what is meant by "Holder in due Course," and tell how his title differs from that of any other holder. In what cases does this special claim not apply?

3 (*b.*) How would you word a note in order to make it: (i) Negotiable by delivery; (ii) Negotiable by endorsement; (iii) Non-negotiable?

2 (*c.*) Explain the significance of the words "Value received" on a note.

2. A draft for $300 was drawn at 30 days' sight by W. Adams on C. Brown, Calgary, favour of M. Cray, and was accepted qualified as to time. It has been endorsed by "blank" endorsement when negotiated to W. Downs; by "qualified" to H. Elliott; for waiving protest to L. Franks; for guarantee to W. Grant; and by restrictive to A. Student.

8 (*a.*) Show the draft, face and back.

3 (*b.*) Give the names of the parties liable, in the order of their liability.

5 (*c.*) If the draft is not paid on the due date, state what steps you would take to enforce collection. What would be the result if you delayed action for a day or two?

12 3. State in order the steps to be taken to complete the incorporation of a Joint Stock Company under: (i) A Dominion Charter; (ii) A British Columbia Charter.

6 4. (*a.*) Describe the documents which must be filed with the Registrar of Joint Stock Companies in order to secure incorporation in British Columbia.

6 (*b.*) Explain the three modes of forming an incorporated company in this Province.

6 (*c.*) Show clearly the difference between a "Private Company" and a "Public Company" incorporated in this Province.

15 5. State briefly the instructions contained in the Dominion Companies Act for: (i) Changing the name; (ii) Increasing or reducing the Capital Stock; (iii) Obtaining further powers; (iv) Borrowing money; (v) Commencing business.

15 6. Outline briefly the steps a company must take under the British Columbia Companies Act: (i) To allot shares; (ii) To change its name; (iii) To alter the objects of the Company; (iv) to reduce its Capital Stock; (v) to wind up the Company.

4 7. (*a.*) Outline the information which must be given in the annual report.

10 (*b.*) In the British Columbia Companies Act what is meant by the following terms: (i) Extra-provincial Company; (ii) Share warrants; (iii) Prospectus; (iv) Special resolution; (v) Extraordinary resolution.

TYPEWRITING.

[NOTE TO PRESIDING EXAMINER.—*Please provide each candidate with plain white letter paper and one sheet of carbon paper.*]

[NOTE.—*Candidates are allowed 5 minutes to read over this paper. Time allowed for Section A, 15 minutes. Section B is to be written in full and the time taken by each candidate to be recorded by the Presiding Examiner. Write each part of Section B on a separate sheet of paper, and hand in carbon copies with originals. A carbon copy of Section A is not required.*]

Value.

50

Section A.

ADVANTAGES OF CARD RECORDS OVER OTHER FORMS, SUCH AS BOUND BOOK AND LOOSE LEAF.

Fundamentally, the situation of Card Records versus the other forms is this:—

The bound book record is as old as modern accounting.

The loose leaf record was a logical step forward.

The card record is the evolution and the higher development of record keeping.

As is always true, the older form gives way slowly to newer ones. Arguments against the new form are being worn down, however, by the distinct superiority of the card record. It is significant that, little by little, loose leaf manufacturers are adding card records and equipment to their product, while the card record manufacturers are abandoning the sale of loose leaf records.

Be that as it may, the bulk of the records of the next business generation will be card records. Still, a legitimate field will always exist for the loose leaf.

The chief points favouring card records are:—

1. *Elasticity.*—The bound book has no elasticity. The loose leaf is limited to a certain size, beyond which it becomes absolutely too bulky for convenience. The card record can expand to any size, without ever becoming difficult to handle.

2. *Perpetuity.*—A bound book carries dead records as long as there is a single live record left. When it is full, a new record book must be used, with constant back reference and confusion. The card record is perpetually alive, as only live records are kept on hand, dead records being removed and filed elsewhere. The loose leaf enjoys this advantage also, but is less convenient.

3. *Easier to Handle Than Other Forms.*—Any book form of record is more awkward than a card record. The leaves of bound books and loose leaf records are flimsy. The books are heavy. There are many operations wasted even in turning to accounts, where the leaves are indexed. Bound books, and especially loose leaf books, are generally bulky and thick. Large records require many books. This causes more operations and much moving and shifting of books. Card records overcome this. There is a distinct economy of energy in the use of card records.

4. *Easier to Keep in Strict Alphabetical or Other Order.*—This is impossible in a bound book without serious waste of space and awkward complications. The loose leaf is satisfactory in this regard as long as it is small. As it gets larger it becomes more and more difficult to use. A card record can be more readily arranged or rearranged than any other form of record.

Value.

5. *In a Card Record Drawer or Tray You Place Only the Cards That Are Needed.*—As only live records are kept there, it is always condensed to the minimum size. This is not true of the bound books.

A loose leaf system has the same advantage as the card record in this regard, but in a lesser degree; and it is more difficult to shift loose leaf records from one binder to another. In this connection, also, if a loose leaf record sheet becomes filled while a man is working on it, he must stop, loosen the binder, take out the old sheet, insert a new one and tighten up the binder again before going on. In a card record a new card is easily inserted—a single operation versus at least five—(generally more).

6. *Very Much More Can Be Done with Cards* than with loose leaf or bound books, in the way of indexing, classifying, cross-referencing, and signalling.

7. *More Than One Person May Work on a Card Record at the Same Time.*—This is not true of book records (bound or loose leaf), without loss of time and frequent interruptions.

8. *In a Given Office Space a Greater Number of Card Records Can Be Used* than is possible with book or loose leaf records.

9. *One Clerk Can Do More on a Card Record* than in a book or loose leaf form. A card record is a distinct time saver. This means greater accuracy and fewer clerks on a large record, and less time of one man on a small record.

10. *The Card Record Is a Definite Saver of Physical Labour.*—One of the factors of mental accuracy is freshness. Fatigue, however slight, impairs the mental efficiency of the employee. Therefore, devices that reduce the physical effort of a man employed in keeping records will increase his value to his employer.

11. *The Card Record Is Generally Actually Less Expensive* than the other forms of records, particularly the loose leaf records. Over a continued period of time the card record is especially economical in the actual dollars-and-cents cost, to say nothing of its convenience and the saving of time and labour.

(Macey.)

50 *Section B.*

Vancouver, B.C., May 25, 1921. Mr. Thomas C. King, 723 Quadra St. Victoria, B.C. Dear Sir: We are very sorry indeed to learn from your letter of the 17th that you have met with financial reverses, and also regret that through an oversight you have allowed your policy to become lapsed.

The company stands ready at any time to help a policy-holder carry his insurance. As you have already made three full premium payments on this policy, you are entitled to a loan value of $111. If you do not desire to borrow any money on the policy to pay the present year's premium, we shall be willing to take your note for the amount of the premium, to become due in thirty, sixty, or ninety days. If you have any cash available, you can send it in, and we shall forward you a note for the difference between the full annual premium and the amount of your remittance. By taking advantage of this offer, you will not need to impair the loan value of your policy. Please let us hear from you. Sincerely yours.

Specifications Model C Drill.

Length, including chuck and Screw Feed .....16 in.
Length, including chuck only .....14 in.
Weight, including chuck and Screw Feed .....22 lb.
Weight, including chuck only .....21 lb.
Weight, equipped with sleeve for No. 1 Morse taper drills .....19 lb.
Capacity in steel or similar metals .....0 to ½ in.
Capacity for tapping in cast iron or sheet steel .....0 to ½ in.
Feed of Screw Feed .....2½ in.
Speeds running idle (two speeds).....250–500 R.P.M.
Consumption under load on 110 volts .....350 watts
Wound for any voltage .....50 to 250 volts
(Carried in stock for 110 and 220 volts.)
Current from ordinary drop cord either A.C. or D.C.

Equipment.

Regular Equipment.—Regular equipment furnished with Model C Drill includes 10-foot cord and attachment plug, handle and a ½-inch chuck for S.S. drills.

Special Equipment.—A ½-inch geared chuck interchangeable with our standard chuck. A special chuck for taking square shank wood bits interchangeable with our standard chuck. The screw feed attachment. A special sleeve for attaching to drill spindle for use with No. 1 Morse Taper drills.

When ordering always *specify your voltage.*

Union Steamship Company of B.C., Limited.

SAILINGS AS FOLLOWS:

S.S. "Cowichan"—Monday, 6 p.m., for Jonstone Strait, Loughborough Inlet.
Thursday, 6 p.m., for Campbell River, Rock Bay route.
Saturday, 2 p.m., for Homfray Channel, Cortes Island, Churchhouse route.

S.S. "Cheakamus"—Monday, 2 p.m., for Okisollo, Kingcome Inlet, Carriden Bay route.
Friday, 6 p.m., for Lewis Channel, Shoal Bay, Topaz Harbour route.

S.S. "Camosun"—Tuesday, 11 p.m., for Ocean Falls, Surf Inlet, Bella Coola.

S.S. "Chelohsin"—Friday, 9 p.m., for Swanson Bay, Prince Rupert and Anyox.

POWELL RIVER SAILINGS—Monday, Wednesday, and Friday, 9.30 a.m.; Monday, Thursday, and Friday, 6 p.m.; Tuesday, 11 p.m.; Saturday, 2 p.m.

BRITANNIA AND SQUAMISH—Daily, 9.15 a.m. (except Sunday).

For Further Particulars Apply to:

Head Office, Foot Carrall Street **Phone Seymour 306**
City Office, 407 Granville Street **Phone Seymour 6120**

Third-year Course, Household Science.

CHEMISTRY. (Time, 2 hours.)

[*All questions are of equal value. Answer any* seven.]

1. What is the source of the principal gaseous fuels? Discuss the advantages of each gas as a fuel.

2. Make a drawing of apparatus that could be used for the preparation of carbon monoxide from carbon dioxide. State what each part of the apparatus is used for. What is the action of carbon monoxide upon the human system?

3. What is the source of the ammonia water of commerce? Show by means of a drawing how ammonia may be prepared in the laboratory.

4. Iron is sometimes a bivalent element, sometimes a trivalent one. What will be the formulæ of the corresponding oxides, chlorides, and sulphates?

5. What is indicated by the terms "hydrocarbon," "acid salt," and "radicle"?

6. What do you understand by "degrees of hardness" as applied to water? How can permanently hard water be softened? Illustrate your answer by means of a chemical equation.

7. Explain fully the process known as saponification. How is this process related to that known as hydrolysis? How can a sample of soap be tested for the presence of soda ash and of sodium silicate?

8. What do you understand by an emulsifying agent? Discuss methods of removing fat-stains from fabrics. What properties should be possessed by a solvent that is to be used in this connection?

COOKERY—THEORY. (Time, 2 hours.)

Value.

4 1. (*a.*) In canning explain the difference between the *hot-pack* method and the *cold-pack* method.

4 (*b.*) Which do you recommend for canning vegetables? Give reasons.

4 (*c.*) Discuss the points leading to success in jelly-making.

6 2. Explain the use of bicarbonate of soda in *two* of the following:—

(*a.*) With molasses in ginger bread.

(*b.*) With sour milk in biscuits.

(*c.*) With tomato in cream soup.

(*d.*) With cheese in scallops.

3 3. (*a.*) What are the chief differences in the cooking of tender and tough cuts of meat?

3 (*b.*) Sketch a side of beef and mark on it in Roman notation three tough cuts and in Arabic three tender cuts.

3 (*c.*) Below the sketch name the cuts and mention how you would serve them.

5 4. How long should the following cook:—

(*a*) A beef tongue (4 lb.); (*b*) mutton stew (2 lb.); (*c*) roast sirloin (6 lb.); (*d*) tenderloin steak (¾ in. thick); (*e*) steamed salmon (3 lb.); (*f*) baked trout (4 lb.); (*g*) dumplings; (*h*) carrots; (*i*) spinach; (*j*) beets; (*k*) soft cooked eggs in the shell; (*l*) sponge cake; (*m*) scalloped rice and cheese; (*n*) bread; (*o*) plain boiled macaroni; (*p*) pumpkin; (*q*) pumpkin pies; (*r*) gems.

Value.

8 5. Give the important points (with reasons) leading to success in combining and cooking *two* of the following:—

(*a*) Baked custard puddings which contain starchy materials; (*b*) omelets; (*c*) breakfast cereals; (*d*) soup stock.

6 6. List the full market order for serving eight persons the following menu:—

Tomato Rice Consomme.
Crackers.
Biscuit Crust Meat Pie. Mashed Potatoes.
Bread.
Fruit Salad. Plain Cake.
Coffee.

4 7. Describe the changes flour undergoes in any *two* of the following:—

(*a*) Bread; (*b*) pie crust; (*c*) fruit cake; (*d*) doughnuts; (*e*) dumplings.

50 Marks for practical work.

DRAWING AND DESIGN. (Time, 2 hours.)

Value.

50 (*a.*) The drawings for the year should be placed in a folder and laid on your desk. These will be collected and marks awarded.

50 (*b.*) Make a design of triangular shape 6" wide, taking the motif from the flower provided. The design to be suitable for embroidery and to be placed on the vest of a garment. Show the stitches on the design and finish in colour.

DIETETICS. (Time, 2 hours.)

Value.

15 1. What are the chief points to be considered in the discussion of the dietetic value of any food? After each give your reasons why that point is worthy of consideration.

15 2. Discuss the food value of any *three* of the following:—

(*a.*) Rare and well-cooked meats.
(*b.*) Graham and patent white flour yeast bread.
(*c.*) Rolled oat porridge and shredded wheat.
(*d.*) Pies and fruit salad with light cake as desserts.
(*e.*) Poached eggs and fried eggs.
(*f.*) Home canned or commercially canned fruit.
(*g.*) Greens or roots as table vegetables.

9 3. Name the types of baking-powders you know and briefly discuss them as lightening agents from the standpoint of health.

5 4. (*a.*) Explain fully "The physiological energy value of 1 lb. of meat is 1,100 calories."

15 (*b.*) Discuss present standards of the food value of any *three* of the proximate principles of foods and give your authority.

15 5. (*a.*) Write out sample balanced menus for one day's meals for a high-school girl who has opportunity to get a warm luncheon.

Value.

5 (*b*.) Discuss warm and cold luncheons.

5 6. (*a*.) Discuss the value of beef tea and milk drinks for an invalid on fluid diet.

3 (*b*.) Name six ways of serving milk as a drink.

5 7. (*a*.) In choosing a dietary, why should we aim at simplicity?

3 (*b*.) What foods would you aim to include every day in all family dietaries?

5 8. What are the chief points in serving vegetables in order to obtain their greatest food value?

DRESSMAKING AND MILLINERY. (Time, 2 hours.)

TEXTILES.

Value.

12 1. (*a*.) Explain the use of the microscope in discovering the qualities and properties of silk.

(*b*.) What is meant by artificial silk, vegetable silk, waste silk, raw silk? Explain the use of each.

(*c*.) "The weave of silk is of paramount importance and ranges through all kinds of designs from plain to the most intricate Jacquard patterns." Explain this paragraph.

3 2. Give three simple tests for doubtful linen.

DRESSMAKING.

10 1. (*a*.) What measurements are required to draft a pattern of a one-piece dress by straight-line system?

(*b*.) Name ten of the most important processes in making a woollen dress with roll collar and long sleeves. Skirt 2 yards round the bottom.

(*c*.) Explain the method of applying collar to bodice and skirt to band.

8 2. (*a*.) A ready-to-wear serge suit which cost $57.50 lasted one year. Compare this as to cost and value with a suit made from cloth at $4.50 per yard and made at home by a dressmaker at $4 per day.

(*b*.) How would you alter a waist pattern that measured too small in the bust? a sleeve that was too short?

MILLINERY.

4 1. Name four of five most important stitches used in millinery and give an example of the use of each.

8 2. Describe the making of a black velvet sailor-shaped hat, using the following headings: (*a*) Drafting pattern, (*b*) making of shape, (*c*) facing, (*d*) covering, (*e*) trimming, (*f*) lining. The whole cost not to exceed $7.

5 3. (*a*.) Make a quick pencil sketch of the hat you describe.

(*b*.) How would you clean a white straw hat?

50 Marks for practical work.

PHYSIOLOGY, HYGIENE, AND HOME-NURSING. (Time, 2 hours.)

Value.

4 1. What special care is necessary to ensure that a child's skeletal system will be strong and well developed?

4 2. Discuss *two* of the following:—

(*a.*) Shoes for general wear.

(*b.*) The use of face creams and powders.

(*c.*) Care of the hair.

(*d.*) Sweets in the diet.

9 3. Discuss the structure and functions of *one* of the following:—

(*a.*) The digestive system.

(*b.*) The circulatory system.

(*c.*) The excretory system.

(*d.*) The nervous system.

4 4. Write as fully as you can upon *one* of the following topics relating to the hygiene of the nervous system:—

(*a*) Concentration; (*b*) worry; (*c*) sleep; (*d*) change of air and scene.

HOME SANITATION.

16 1. Write upon *two* of the following:—

(*a.*) Disposal of house wastes in a city.

(*b.*) Disposal of house wastes in the country.

(*c.*) The best finishing for kitchen floors.

(*d.*) Ventilation of a house by natural means.

(*e.*) The care of the basement or cellar.

(*f.*) Disinfectants for home use.

4 2. Explain any *four* of the following: Sills, house-drain, girders, soil-pipe, trap, chemical closet, window-weights.

HOME-NURSING.

9 1. Write on *one* of the following:—

(*a.*) The transfer of disease and means to prevent it.

(*b.*) The reaction of the body against disease and the means that can be taken to assist such reaction.

(*c.*) Malnutrition in children and the means to prevent it.

50 Marks for practical work.

Third-year Course, Technical.

ARITHMETIC AND ALGEBRA. (Time, 2 hours.)

[N.B.—*Omit any* one *of the last* three *questions. Logarithmic tables and graph paper are provided.*]

Value.

10 1. (*a.*) Given $\frac{1}{v}-\frac{1}{u}=\frac{\mu-1}{r}$, express in simplest form each quantity separately in terms of the other quantities. If $v=5$, $u=10$, $r=10$ find μ.

(*b.*) If $A=\pi R^2$, $C=2\pi R$, express A in terms of C.

10 2. (*a.*) Express $\frac{1+\sqrt{2}}{\sqrt{3}-1}$ with a rational denominator and find its value correct to 3 decimal places.

(*b.*) Simplify $(ab^{-1})^{-2}\times(bc^{-1})^{-\frac{1}{2}}\times(ca^{-1})^{\frac{3}{2}}$.

10 3. (*a.*) Factor the following :—

$x^2+2x-120$.

$(3x+y)^2-5y(3x+y)+6y^2$.

x^4+x^2+1.

$x^{12}+1$.

$12x^2-13x-35$.

(*b.*) Simplify :—

$$\frac{1}{a-b}\left\{\frac{(a-b)^3+(b-c)^3}{a-c}-(a+c-2b)^2\right\}.$$

12 4. Solve the equations :—

(*a.*) $51x^2-53x=21$ (correct to 2 decimal places).

(*b.*) $x^2-20=y^2-5=xy$.

13 5. A wheel has 720 teeth and is rotated 12.6 times per second. A narrow beam of light just passes between 2 teeth, falls on a mirror 8663 metres away, and when it returns, is intercepted by one of the teeth between which it had passed. Find the speed of light.

16 6. The following quantities seem to obey a law of the form $W=aP+w$. Find the probable values of a and w.

W	11	13.2	15.7	17.9	20.2	22.5	24.7	27.2	29.3	31.7
P	1	2	3	4	5	6	7	8	9	10

16 7. Draw a quadrant of a circle radius $3\frac{1}{2}''$ and draw the tangents at its extremities. Use Simpson's Rule (taking 10 divisions) to find the area included between the circumference and the tangents. Find the percentage error in your result.

13 8. Find the number of gallons per minute which flow past a section of a circular pipe of diameter d inches if the speed of the water is f feet per second. How long would it take to fill a spherical vessel of diameter b feet? Complete the two calculations when $d=11.2$, $f=22.8$, $b=7.9$.

13 9. Construct a graph to give the relation between centimetres and inches (1 inch = 2.54 cm.) Thence determine the number of cm. in 3.3 inches and the number of inches in 8.2 cm.

13 10. The time of vibration of a pendulum varies as the square root of the length. If the time is 1.4 seconds when the length is 49 cm., what will be the time of vibration for a pendulum of length 100 cm.?

CHEMISTRY. (Time, 2 hours.)

[*The value of each of the first* eight *questions is 12. Answer any* six.]

(Fe = 56; S = 32; H = 1; O = 16; N = 14; Cu = 63.)

1. Write a short description, with sketches, of the commercial manufacture of nitric acid.

2. Carbon occurs in many *allotropic* modifications. What is the exact meaning of this statement?

3. By what process could you show that water is a compound? How would you proceed to ascertain its quantitative composition?

4. Dalton is often called the "Father of Quantitative Chemistry." Why? What great discoveries did he make?

5. Why is a knowledge of *valency* essential before *equations* can be used in chemistry? Write fully on this topic.

6. Carbon unites with oxygen in two definite proportions. What are the two compounds produced? Show that there are reasons for thinking that there *can* be only two such oxides of carbon.

7. "Water is the most general solvent known." How would you proceed to show that this statement is true?

8. You desire to prepare a sample of pure ammonium nitrate. Give in detail every stage of the process you would adopt.

[*The value of each of the following questions is 14. Answer any* two.]

9. Choose two of the following subjects and write clearly yet briefly on each: (*a*) The blast-furnace; (*b*) the Bessemer converter; (*c*) open-hearth process; (*d*) cementation process.

10. A manufacturer desires to produce 10 tons of 95% sulphuric acid. How much iron pyrites (FeS_2) and what weight of steam must he provide?

11. Complete the following equation and give *all* the information it conveys to you:—
$Cu + HNO_3 = Cu\ NO_3 + H_2O + NO$.

12. 32 grams of sulphur are completely burnt in pure oxygen gas and the gas collected. When measured at 17° C. and 750 mm. pressure the volume is found to be 24.04 litres. From this data calculate (correct to the nearest whole number) the atomic weight of oxygen.

DRAUGHTING. (Time, 2 hours.)

Value.

50 (*a*.) The drawings for the year should be placed in a folder and laid on your desk. These will be collected and marks awarded.

50 (*b*.) Make a freehand sketch of the machine detail supplied and mark the measurements thereon. From this sketch make a finished drawing.
(Project: Such machine parts as a lathe-dog, tool-post, or scribing-block to be used.)

ELECTRICITY. (Time, 2 hours.)

[*The value of each of the first* eight *questions is 12. Answer any* six.]

1. You may choose any *two* of the following instruments to illustrate a short essay on electrical measuring instruments: (*a*) An ammeter; (*b*) a d'Arsonval galvanometer; (*c*) a voltmeter.

2. I wish to measure the resistance of a cold carbon lamp. What instruments should I use? How should I connect up the circuits?

3. Write a full description of the *Brown and Sharpe* wire table. Show if you can how the important points in this table can be easily carried in the memory.

4. Why is A.C. used for long-distance transmission in preference to D.C.? Write fully.

5. What is a *sine curve?* What is its value to an electrical engineer? How would you proceed to obtain the *curve* of an A.C. generator?

6. Define volt, cell, ampere, series, root-mean-square.

7. Give a complete wiring diagram for a motor-generator charging set for charging *storage-batteries.*

8. Write a short essay on the three important types of D.C. generators.

[*The value of each of the following questions is 14. Answer any* two.]

9. How does the ordinary house-meter measure the power supplied to a house? Give sketches and show that you understand not only its construction but the unit it measures.

10. What is the modern conception of the term: *A current of electricity?* Write clearly as to a beginner in the subject of electricity.

11. What would be the combined resistance of three 110-ohm, two 220-ohm, and two 440-ohm carbon lamps all connected in parallel? If such a *bank* of lamps were connected to 110-volt mains, what would be the total current flowing in the circuit? Give a sketch of the *bank* and its connection to the mains.

12. Write a clear description of a *storage-cell.* How is such a cell charged? Give all chemical equations which will render your answer any clearer.

GEOMETRY. (Time, 2½ hours.)

Value.

10 1. If a straight line falling upon two straight lines makes the alternate angles equal to one another, prove that the two straight lines are parallel.

12 2. Show that equal chords of a circle are equally distant from the centre. A chord of a circle is of constant length but its position changes. A point is taken on it at a fixed distance from one of its ends. Find the locus of this point.

11 3. A lighthouse facing N. projects a beam of light covering an angle of 25°. A vessel sailing N.W. at 12 knots sees the light for 10 minutes. Find graphically the ship's shortest distance from the lighthouse. (1 knot = speed of 6,080 feet per hour.)

10 4. Prove that the angle subtended by a diameter of a circle at any point of its circumference is a right angle.

11 5. ABCD is a parallelogram. All its angles are bisected internally and the bisectors form by their intersections a figure HKLM. Prove that HKLM is a rectangle.

Value.

11 6. A man 6 feet high stands x feet from the foot of an electric-light standard. The light is 35 feet high and his shadow is 8 feet long. Find x. Show clearly your calculation and check your answer by a drawing to scale.

11 7. AB is a diameter of a circle and P is any point on its circumference. The tangent at P meets AB produced at D. DE the perpendicular to AD meets AP produced at E. Prove DP = DE.

12 8. Draw a straight line AB 2 in. long and lay off by construction the following angles: ABC = 30°, ABD = 75°, ABE = 120°, all on the same side of AB. Make BC = 3 in., BD = 3.5 in., BE = 2.75 in. Join ACDE and reduce the figure thus obtained to a triangle, vertex at D and base in AB produced. Find its area.

12 9. A regular pyramid 3 in. high stands on a pentagonal base each edge of which is 2 in. long. Using ruler, compasses, and protractor, draw (full size) one of the side faces of the pyramid.

MECHANICS. (Time, 2 hours.)

[*The value of each of the first* eight *questions is 12. Answer any* six. Eight *questions constitute a full paper.*]

1. Sketch and describe the action of: (*a*) The suction and lift pump; (*b*) the suction and force pump; and (*c*) the plunger pump.

2. The distance between the centres of two bodies is 36 inches. The weights of the two bodies being 17 and 90 lb. respectively, where is the centre of gravity of the combination? Define clearly any terms you use and show fully your calculations.

3. Explain clearly the following, giving sketches of each: (*a*) Bevel gears; (*b*) pitch circle; (*c*) worm gear; (*d*) rack and pinion; (*e*) back-lash; (*f*) driver and follower.

4. Assuming that 1 cu. ft. of water weighs 1,000 oz., what would be the total force tending to force upward a cube of wood of 2 ft. edge and specific gravity 0.5 when sunk to a depth of 30 ft. in salt water of specific gravity 1.004?

5. Explain the exact purposes served by a fly-wheel and a governor on an engine.

6. Describe clearly, with sketches, all the forms of barometers you have seen used.

7. Sketch and describe a steam-pressure gauge.

8. At the point of *cut-off* in the cylinder of an engine the volume of steam in the cylinder is 405 cu. in. The pressure as shown by the indicator diagram is 125 lb. per sq. in. What will be the pressure shown on the diagram when the piston reaches the end of its stroke if the volume of the cylinder be 1,200 cu. in.? Explain.

[*The value of each of the following questions is 14. Answer any* two.]

9. What do you understand by *absolute pressure* as used in steam-engine practice? Explain clearly how this pressure could be nearly approached in an engine. Show sketches to illustrate your answer.

10. Sketch and describe clearly a steam engine *indicator*. Give an example of an indicator card and show what information an engineer could obtain from such a diagram.

11. What do you understand by the *modulus of elasticity?* Give any example you can to show its use in mechanics.

12. Write a short essay showing why *perpetual motion* is an impossibility.

PHYSICS. (Time, 2 hours.)

[*The value of each of the first* eight *questions is 12. Answer any* six.]

1. People sometimes say that water-pipes burst when the *thaw comes*. Prove that this is not true by showing when, and why, the bursting actually takes place.

2. Sketch and describe the action of the ordinary kitchen stove and *boiler* for heating water for domestic purposes. By which of the methods of transmission is the heat transferred from the fire to the *boiler?*

3. How do you account for the fact that the furniture of a *sun-parlour* becomes distinctly warm whilst the glass of the windows remains quite cool?

4. Water-mains are being laid in the street. Both ends of the pipe are open. A workman is hammering at one end. The length of the pipe is about 500 feet. If you place your ear at the distant end and the workman gives a series of very slow blows, what could you learn about the transmission of sound?

5. Describe any *reed* instrument you have studied. Sketch and carefully show how the *reed* produces a *musical* sound.

6. Define clearly: (*a*) Mono-chromatic light; (*b*) light wave; (*c*) ray; (*d*) spectrum; (*e*) interference.

7. Motorists often use a *rear-vision* mirror of the diminishing type. Explain clearly how it is that they see everything in its true relative position and only diminished in size?

8. Sketch and describe any apparatus you have seen or used to prove the phenomenon of *refraction.*

[*The value of each of the following questions is 14. Answer any* two.]

9. Define very carefully the following terms: (*a*) Temperature; (*b*) heat; (*c*) specific heat; (*d*) latent heat; (*e*) sensible heat; (*f*) B.t.u.; (*g*) calorie; (*h*) expansion; (*i*) calorimeter; (*h*) heat transference.

10. Using as an illustrative apparatus *the siren*, explain clearly the meaning of the term *interval.*

11. Describe the production of sound by *bowing* a violin. Keep in mind the following points: (*a*) The number of strings; (*b*) tuning; (*c*) fingering; (*d*) rosin; (*e*) the harmonics; (*f*) why the violin is such a beautiful instrument of music.

12. Write a clear account of the cinematograph projection lantern, explaining how it is that we see (with a good instrument) an apparently stationary scene with movement of the figures in it.

TRIGONOMETRY. (Time, 2 hours.)

[N.B.—*Logarithmic tables are provided.*]

Value.

8 1. (*a.*) If A is an acute angle show that tan A is greater than sin A.
(*b.*) Without using tables find the numerical values of the six trigonometrical ratios of 30° and 60°.

7 2. The string of a kite is 250 feet in length. How high is the kite above the ground when the string, supposed stretched tight, makes with the ground an angle $\tan^{-1}\frac{24}{7}$?

15 3. Show that there are two triangles having the following parts: $a=6$, $b=8$, $A=34°$. Solve the triangles.

Value.

13 4. If the sides of a triangle are 297.3, 437.1, and 248.6 units respectively, find the largest angle.

15 5. (*a.*) Show that $\sin (A - B) = \sin A \cos B - \cos A \sin B$ in the case where A and B are acute angles.

(*b.*) Prove $\cos 2\theta = \dfrac{1 - \tan^2 \theta}{1 + \tan^2 \theta}$.

(*c.*) Prove $\dfrac{\sin \theta + \sin \phi}{\sin \theta - \sin \phi} = \tan \dfrac{1}{2}(\theta + \phi) \cot \dfrac{1}{2}(\theta - \phi)$.

15 6. A circular cylinder of radius 2 feet is lying on a horizontal plane. Leaning across it at right angles to its axis is a plank 7 feet long. If the lower end of the plank is on the plane and is 4 feet from the line of contact of the cylinder and plane, find the height of the upper end of the plank above the plane.

12 7. Calculate as accurately as your tables permit:—

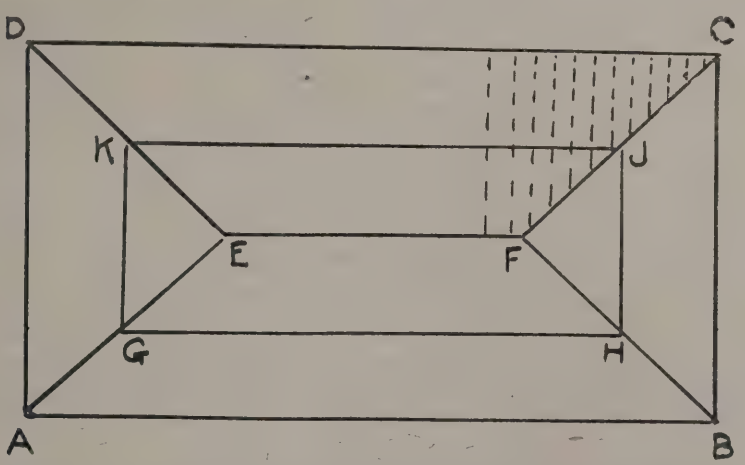
$$\frac{37.93 \times 257.1^{\frac{1}{2}}}{\sqrt[5]{7.98} \times \sqrt[4]{7.673}}.$$

15 8. A man at sea-level observes that the elevation of a mountain is 32° 11′; after walking directly towards it for a mile along a road inclined at an angle of 10° to the horizontal, he finds the elevation of the mountain to be 47° 23′. Find the height of the mountain.

WOOD AND METAL WORK—THEORY.

WOODWORK. (Time, 1½ hours.)

[*Answer* three *questions only. Nos. 1 and 2 together with either 3 or 4.*]



Value.

50 1. The plan of a hipped roof is given. The roof is 54′ long, 26′ wide, and rise ¼ span. The purlins are shown by G, H, J, K, and the jack and common rafters are indicated by dotted lines. Draw the plan and elevation of one truss to a scale of ¼″ to 1′, and from them obtain the following:—

(*a.*) The true length of the hip rafter A, E.

(*b.*) The correct bevels or "cuts" for the top and lower ends of the hip rafter.

(*c.*) The bevels for the jack and common rafters.

Value.

30 2. Place the suitable dimensions on the various roof members and name them. Prepare a list showing the quantity of timber required in the construction of the roof.

20 3. Make freehand sketches explaining the construction of three joints in one of the above trusses.

20 4. Give neat sketches showing the meaning of the following terms: Dog-legged stair; Hyperbola, Ogee, or Cyma recta moulding; Tusk tenon-joint.

METALWORK. (Time, 1½ hours.)

[*Answer* three *questions only. Nos. 1 and 2 together with either 3 or 4.*]

Value.

40 1. Mark on the blue-print provided the following parts of the lathe: Back-gear lever; head-stock; face-plate; tail-stock; apron hand-wheel; cross-feed lever-knob; lead screw; lathe-bed.

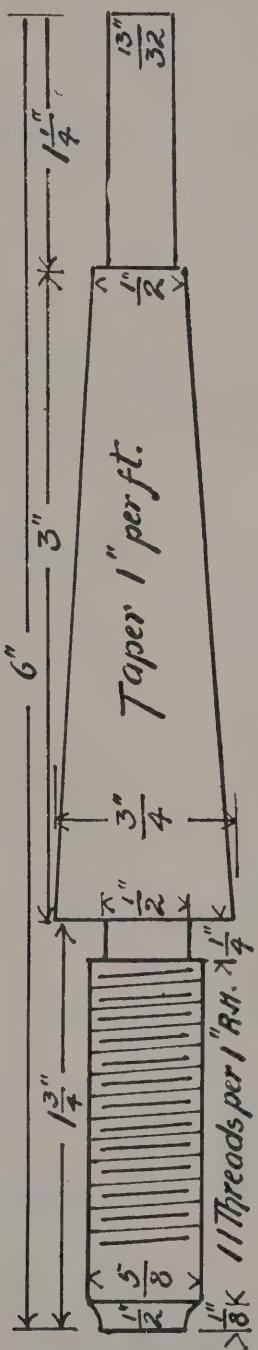
40 2. Give the rule for gearing a lathe for screw-cutting. If the lead screw has eight threads per inch and a bolt is required having eleven threads per inch, what gear would you use?

20 3. Make sketches of three seams in sheet-metal work. Explain why fluxes are used in soldering sheet metal and name those you have used.

20 4. In drawing out stock of any shape it should first be hammered square. Why is this? Explain by words and sketches how you could weld an upset-head bolt 9 inches in length.

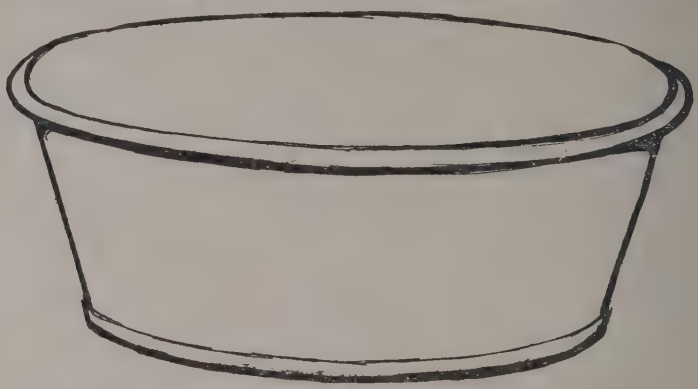
PRACTICAL MACHINE-WORK. (Time, 1½ hours.)

Problem: From stock supplied make a spindle to measurements given below.



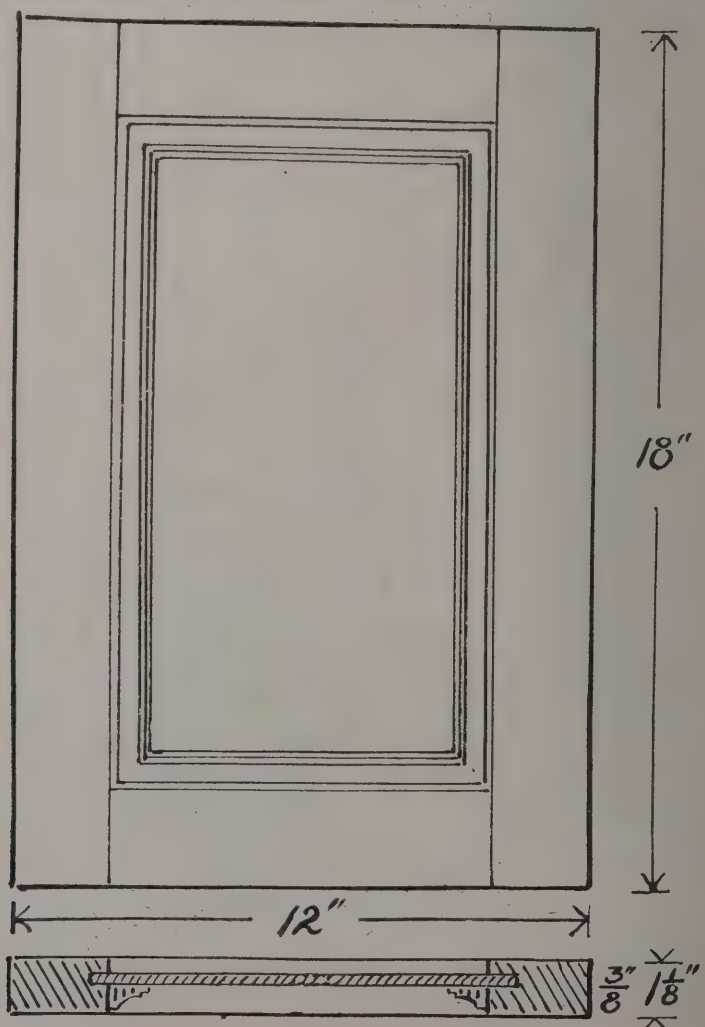
PRACTICAL SHEET-METAL WORK. (Time, 1½ hours.)

Problem: Develop the pattern and make the pan illustrated below. Diameter of top, 6¼"; diameter of bottom, 4¾"; height, 2⅝". Bottom to be burred and soldered; top to be wired.



PRACTICAL WOODWORK. (Time, 3 hours.)

Problem: From the stock and measurements supplied make a panelled door. Joints to be haunched tenons.



University Matriculation (Junior).

AGRICULTURE. (Time, 2 hours.)

[*All questions have equal value. Answer* six *questions only.*]

1. Describe some insect affecting the crops in your neighbourhood and suggest preventive methods.

2. Discuss how the best layers may be selected in a flock of pullets.

3. State, with reasons, your choice of cattle breed and give an account of its typical features.

4. What precautions should be observed in the storing and shipping of milk?

5. Mention your locality and sketch the handling, from planting to harvest, of one of its most important field crops.

6. Discuss principles of selection and the method of seed production in connection with any flower or vegetable of your own choice.

7. State what you understand by crop rotation, and explain why it should be practised.

8. Describe the planting, cultivation, and harvesting of the fruit crop which is most profitably grown in your vicinity.

ALGEBRA. (Time, 2 hours.)

Value.

9 1. (*a.*) Factor:—

(i.) $a^4 - a^2 - 9 - 2a^2b^2 + b^4 + 6a.$

(ii.) $a^3 + 3a^2b + 3ab^2 + 2b^3.$

(iii.) $a^4b - a^2b^3 - a^3b^2 + ab^4.$

4 (*b.*) Find as simply as possible the value of $\frac{.5433^2 - .4567^2}{.5433 - .4567}$.

6 2. (*a.*) Divide $\frac{2x}{x+y} + \frac{y}{x-y} - \frac{y^2}{x^2-y^2}$ by $\frac{1}{x+y} + \frac{x}{x^2-y^2}$.

5 (*b.*) Reduce $\frac{x^{\frac{2}{3}} - 4\sqrt[3]{x^{-2}}}{\sqrt[3]{x^2} + 4 + 4x^{-\frac{2}{3}}}$.

6 3. (*a.*) Show that $\frac{1}{\sqrt{16 + 2\sqrt{63}}} + \frac{1}{\sqrt{16 - 2\sqrt{63}}} = 3.$

4 (*b.*) Simplify $\sqrt[3]{21 + 7\sqrt{2}} \times \sqrt[3]{21 - 7\sqrt{2}}.$

5 4. (*a.*) Solve $\frac{6\sqrt{x} - 11}{3\sqrt{x}} = \frac{2\sqrt{x} + 1}{\sqrt{x} + 6}$.

5 (*b.*) Solve $5x^2 - 15x + 11 = 0.$

13 5. The length of a field exceeds its breadth by 30 yards. If the field were square but of the same perimeter, its area would be $\frac{1}{24}$ greater. Find the sides.

10 6. (*a.*) Solve $\left.\begin{matrix} x^2 - xy = -6 \\ y^2 + 3xy = 10 \end{matrix}\right\}$.

Value.

8 (*b.*) Solve $\frac{2x-27}{x-14}+\frac{x-7}{x-8}=\frac{x-12}{x-13}+\frac{2x-17}{x-9}$.

13 7. A number has three digits, the units being $\frac{1}{2}$ of the tens and $\frac{1}{3}$ of the hundreds. If 396 be substracted from the number, the digits are reversed. Find the number.

12 8. Prove that the points (3, 2), (8, 8), (−2, −4) lie on a straight line. Find its equation.

Prove algebraically and graphically that it cuts the x-axis at a distance of $1\frac{1}{3}$ from the origin. (Graph paper will be supplied.)

BOTANY. (Time, 2 hours.)

[NOTE.—*(a.) Illustrate your answers by the use of diagrams. (b.) All questions are of equal value. Answer* three *only.*]

1. Write an account of stems under the following heads, giving examples:—
   (*a.*) Structure in relation to the work of support and of food conduction.
   (*b.*) Describe three stems which are specialized as food-storage parts of the plant.

2. Give an example of an alga, a fungus, a moss, and a fern. Tell briefly how each:—
   (*a.*) Obtains its food materials.
   (*b.*) Reproduces.
   (*c.*) Tides over adverse conditions such as drought or cold.

3. Give five examples of Conifers. How would you distinguish each from the others? Describe the leaves as to their shape, structure, and arrangement, and tell how they are related to conditions of living. Describe the cones and give an account of how the seeds are produced and scattered. Write a note on the economic importance of each conifer mentioned.

4. (*a.*) Mention a plant of each of the following families: Ranunculaceæ, Rosaceæ, Ericaceæ, Labiatæ, Compositæ. Describe and compare the corollas of the five plants named.

   (*b.*) Name a plant of each of the following families: Gramineæ, Cruciferæ, Rosaceæ, Leguminosæ, Compositæ. Describe and compare the carpels and fruits of these plants.

CHEMISTRY. (Time, 2 hours.)

[*All questions are of equal value. Answer* seven *only.*]

1. Describe an experiment by means of which you could prove the statement that in any chemical reaction the total weight of the reacting substances is the same after the reaction as before.

2. Explain carefully what contributions Dalton made to the Science of Chemistry.

3. At a temperature of 22.5° C. and a pressure of 750 mm. of Hg., what volume will be occupied by the hydrogen that is set free by the action of 2.5 grams of sodium on water, the weight of a litre of hydrogen being 0.09 gm. at 0° C. and 760 mm. pressure? (H = 1.008; Na = 23.05.)

4. What acids do you know that contain the element chlorine? Describe the preparation and properties of one of these acids.

5. What significance does the number 22.4 (litres) have when applied to the volume of a gas? Upon what hypothesis does the application of this number to gas volumes depend for its usefulness?

6. Write chemical equations illustrating the interaction of manganese dioxide and hydrochloric acid, of steam and red-hot iron, and of sulphuric acid and bleaching-powder.

7. If you were given a piece of marble in the laboratory, how would you proceed to prepare a solution of calcium hydroxide?

8. Write as fully as you can regarding the occurrence and the properties of the element sulphur.

ENGLISH COMPOSITION. (Time, 2 hours.)

Value.

25 1. Write a well-constructed paragraph of about a page on *one* of the following topics:—

(*a.*) Gareth, the Scullion.

(*b.*) The Wrestling Match in "As You Like It."

(*c.*) Plans for the Summer.

60 2. Write an essay of not less than two pages on *one* of the following:—

(*a.*) An Old English Christmas ("Sketch Book").

(*b.*) Nelson's Greatest Qualities as an Admiral.

(*c.*) The Character of Silas Marner.

(*d.*) Queen Elizabeth as depicted by Scott.

5 3. (*a.*) Punctuate the following sentence:—

There is one pursuit commerce one type the business man one idea that of increasing wealth.

10 (*b.*) With as few changes as possible, rearrange in an effective paragraph the following passage concerning the life of a peasant:—

Fourteen hours of sun and labour and hard fare—now tell him what to do—to go straight to his plank bed in the cowhouse—to eat a little more dry bread, borrow some cheese or greasy bacon—munch it alone, and sit musing until sleep came—he who had nothing to muse about—I think it would need a very clever man indeed to invent something for him to do, some way for him to spend his evenings—read—to recommend a man to read after fourteen hours of burning sun is a mockery—darn his stockings would be better.

ENGLISH LITERATURE. (Time, 2 hours.)

[*Candidates will answer Section A, and* either *Section B* or *Section C.*]

SECTION A. POEMS OF THE ROMANTIC REVIVAL.

Value.

20 1. Discuss, in about two pages, three characteristic qualities of Tennyson's poetry as illustrated by the selections studied in this course.

14 2. Write on any *two* of the following (about a page on each):—

(*a.*) The ideas that most appeal to you in "Intimations of Immortality."

(*b.*) Keats' style in "The Eve of St. Agnes."

(*c.*) The spirit of revolt in the poems of Shelley.

Value.

16 3. Make a brief note of explanation on any *four* of the following quotations, naming the author and poem from which each is taken:—

(*a.*) "Yet the will's somewhat—somewhat, too, the power—
And thus we half-men struggle."

(*b.*) "The Moon of Mahomet
Arose, and it shall set:
While, blazoned as on heaven's immortal noon
The cross leads generations on."

(*c.*) "Have sight of Proteus rising from the sea;
Or hear old Triton blow his wreathèd horn."

(*d.*) "It may be we shall touch the Happy Isles,
And see the great Achilles, whom we knew."

(*e.*) "Lest you should think he never could recapture
The first fine careless rapture."

SECTION B. "THE MERCHANT OF VENICE."

21 1. In about three pages discuss the character of Portia. Use short quotations whenever possible.

14 2. Write on *two* of the following (about a page on each):—

(*a.*) The meaning of the song beginning, "Tell me where is fancy bred."

(*b.*) The purpose served by the introduction of the Prince of Morocco and the Prince of Arragon.

(*c.*) The character of Antonio.

15 3. Give the context of each of the following and explain:—

(*a.*) "We freely cope your courteous pains withal."

(*b.*) "For the close night doth play the runaway
And we are stay'd for at Bassanio's feast."

(*c.*) "Give him a livery
More guarded than his fellows: see it done."

(*d.*) "With purpose to be dress'd in an opinion
Of wisdom, gravity, profound conceit."

(*e.*) "A golden mind stoops not to shows of dross."

SECTION C. "HENRY V."

21 1. Discuss, in about three pages, the character of Henry V. as revealed to you in the following long speeches delivered by him in the course of the play:—

(*a.*) The address to the army before Harfleur, beginning:—
"Once more unto the breach, dear friends, once more."

(*b.*) The lines on ceremony, beginning:—
"O ceremony, show me thy worth."

(*c.*) The reply to Westmoreland, beginning:—
"No, my fair cousin,
If we are mark'd to die, we are enow
To do our country loss."

In the course of your answer quote a passage of about ten lines from one of these extracts.

14 2. Write on *two* of the following (about a page on each):—

(*a.*) Falstaff's connection with the play.

(*b.*) The purpose and dramatic effectiveness of the chorus.

(*c.*) The best drawn humorous figure in the play.

Value.

15 3. Give the context of each of the following and explain:—

(*a.*) "I stay but for my guidon: to the field."

(*b.*) "For indeed these three antics do not amount to a man."

(*c.*) "Each battle sees the other's umber'd face."

(*d.*) "I have no cunning in protestation."

(*e.*) "For, hearing this, I must perforce compound
With mistful eyes, or they will issue too."

HISTORY. (Time, 2 hours.)

[*Answer* four *questions only.* Two *are to be selected from Part A and* two *from Part B. All questions have equal value.*]

A.

1. Estimate the contribution of Egypt to the civilization of mankind during the period 4000–3000 B.C. and also during the Empire.

2. Sketch the leading features of Athenian civilization during the Empire.

3. Under the following heads, trace the history of the Roman Republic from its foundation to the end of the Punic wars:—

(*a.*) Political Struggles.

(*b.*) Conquests.

4. Account for the decline of Roman civilization during the Empire and outline the chief causes of its fall.

B.

5. What were the chief characteristics and activities of the Mediæval Church?

6. Write on the origin and results of the Crusades, and give an account of the First Crusade.

7. Discuss the Renaissance in Europe under the following heads:—

(*a.*) Art and Literature.

(*b.*) Explorations and Discoveries.

(*c.*) Religious Movements.

8. Show how Absolute Monarchy triumphed in France under Louis XIV. and failed to triumph in England under the Stuarts.

GEOMETRY. (Time, 2½ hours.)

[*N.B.—Draw neat diagrams, use printed capitals, and give authorities.*]

Value.

10 1. (*a.*) Enunciate two theorems in each of which, from data given relating to the angles of a triangle, a conclusion is drawn regarding the sides of the triangle.

(*b.*) Prove *one* of these in full.

10 2. If two triangles are equal in area, and stand on the same base and on the same side of it, they are between the same parallels.

Value.

16 3. ABC is a given triangle and X is a given point. Draw a triangle equal in area to ABC, having its vertex at X and its base in the same straight line as BC. State your construction and give a theoretical proof.

14 4. The angles made by a tangent to a circle with a chord drawn from the point of contact are respectively equal to the angles in the alternate segments of the circle.

18 5. From any external point P two tangents are drawn to a given circle touching it at A and B. A and B are joined and P is joined to the centre of the circle, X. PX cuts the chord AB at Y. Prove that the rectangle contained by PX and XY is equal to the square on XB.

14 6. To draw an isosceles triangle having each of the angles at the base double of the vertical angle.

18 7. AB is a fixed chord of a circle and AC is a movable chord passing through A. If the parallelogram CB is completed, find the locus of the intersection of its diagonals.

FRENCH GRAMMAR. (Time, 2 hours.)

Value.

10 1. Put the following sentences in the plural (*all parts* of the sentence are to be given in the plural as far as the sense permits) :—
Ce beau bateau traverse la Manche.
Le cheval qui galopait au loin était effrayé.
Pourquoi ne répondis-tu pas?
Il accrocha son fusil à un clou.

10 2. Put the following sentences in the plural:—
Qu'est-il devenu?
Il l'a vu.
S'est-il blessé?
Son frère s'en est repenti.
Il s'est coupé le doigt.

10 3. Substitute in the following a personal pronoun for the portions printed in italics:—
Parlez *de la littérature française.*
Va *à l'école.*
Il a envoyé *la lettre à son frère.*
Il m'a donné *la pomme.*
Vous l'avez vu *au match de football.*
Voici *la Tour Eiffel.*
Parlez *à votre père de mes ennuis.*

25 4. Give:—

(*a.*) The imperfect indicative of *ressembler à son frère* (possessive of the same person and number as the subject).

(*b.*) The future of *concevoir une mauvaise idée de leur hospitalité.*

(*c.*) Present subjunctive of *choisir, voir, devenir, s'en aller, s'y attendre.*

(*d.*) Present indicative, first person singular and first person plural only of *voir, dire, descendre, dormir, se repentir, couvrir.*

(*e.*) Past participle of *concevoir, aller, couvrir, dormir, mourir, dire, souffrir, voir, vivre.*

Value.

10 5. Reply in French in complete sentences to the following questions:—

(*a.*) Où demeurez-vous?

(*b.*) Qu'avez-vous fait pendant les vacances de Paques?

(*c.*) Combien de frères et de soeurs avez-vous?

(*d.*) Quel sport préférez-vous?

(*e.*) N'aimez-vous pas le français?

10 6. (*a.*) Give the comparative and superlative of une bonne mère; un mauvais moment.

(*b.*) Give the adverbs corresponding to vif, brusque, fier, parfait, majestueux, naturel.

10 7. Put the word for this (or that) before the following words: Mur, oiseau, homme, femme, oiseaux, hommes, femmes, horloge, murs, horloges.

15 8. Make the necessary changes in the following verbs printed in italics:—

(*a.*) Il est malade depuis qu'il *être* rentré à la maison.

(*b.*) J'ai arrosé les fleurs afin qu'elles *être* plus fraîches.

(*c.*) Je le lui ai donné de crainte qu'il *revenir*.

(*d.*) Il avait dix ans lorsqu'il *perdre* sa mère.

(*e.*) Pour qu'on vous *obéir*, obéissez aux lois.

(*f.*) Quoi qu'il *faire* froid je dois sortir.

(*g.*) Je le punirai à moins qu'il ne le *faire*.

(*h.*) Elle s'amusait pendant que les vaches *brouter* l'herbe.

(*i.*) Quand j'*avoir* de l'argent je vous payerai.

(*j.*) Je lui demande s'il *venir*.

(*k.*) Je serais venu si j'en *avoir* eu le temps.

(*l.*) Il est sorti parce qu'il *faire* beau temps.

(*m.*) Il y a huit ans que Jean *être* élève au Lycée.

(*n.*) Il y a longtemps qui je le *désirer*.

FRENCH TRANSLATION. (Time, 2 hours.)

[N.B.—*Candidates should work slowly and revise carefully. Every sentence is framed to illustrate some point of grammar or syntax. Careless work entails serious loss of marks.*]

Value.

40 1. Translate into good English:—

Ce jour-là plus d'un Parisien a dû dire en rentrant chez lui le soir pour se mettre à table: "Quel singulier petit bonhomme j'ai rencontré aujourd'hui."

C'était justement une journée de la fin de l'hiver, une de ces journées tièdes et lumineuses qui, à Paris, souvent sont plus le printemps que le printemps lui-même. Il y avait beaucoup de monde dehors. Un peu étourdi par le va-et-vient bruyant de la rue, j'allais devant moi, timide, et le long des murs. Je me gardais bien de m'arrêter devant les magasins, et pour rien au monde je n'aurais demandé ma route.

Je marchai ainsi près d'une heure jusqu'à un grand boulevard. Il y avait là tant de bruit, tant de gens, tant de voitures, que je m'arrêtai presque effrayé. Comment me tirer d'ici? pensai-je en moi-même. Comment rentrer à la maison? Je risquais fort de rester là jusqu'au grand coup de trompette du jugement dernier, quand soudain Jacques parut à mes côtés. Il était aussi étonné que moi.

(N.B.—Tiède—mild, warm.)

Value.

60 2. Put into French:—

Louis—How long have you been in Bordeaux?

Harry—We have been here three weeks. We did not expect to stay so long when we left Paris. We are on the way to Pauillac.

Louis—You find the city so beautiful that you have decided to stay longer.

Harry—That was scarcely the reason. As our train was going along the banks of the Loire it was derailed. We were not injured, but very many others were less fortunate. Madame Dubois was so much agitated by the accident that she was long in recovering.

Louis—I hope she is better to-day.

Harry—Yes, she is in quite good health at last. But her illness was far from being the last of our misfortunes. The day after we arrived, Jean, Marcel, and I went walking to see the sights of Bordeaux. We were in the park. The weather was very hot. Marcel was hot and tired. He sat down on the grass. He did not notice that it had just been watered. He took a bad cold and has been very ill for a fortnight. The Bordeaux doctors are scarcely so good as the Paris ones.

Louis—Did you expect that?

Harry—You are laughing at me because I say what I think.

Louis—We have become accustomed to it. Parisians always think themselves superior to the inhabitants of any other city in the world. I hope that little Marcel is better.

Harry—Oh, yes, but we shall not be able to leave for Pauillac before Thursday. To-day is Monday. We have only four weeks' vacation. It would have been better to stay in Paris. We could have visited the Zoo every day, which would have been at once instructive and amusing.

GERMAN GRAMMAR. (Time, 2 hours.)

Value.

10 1. Add the correct case endings after the prepositions in the following:—

Mein Freund iſt mit ſein — Frau und ſein — Kind — (plural) auf d — Land gegangen. Er wird da während d — Sommer wegen ſein — Geſundheit bleiben. Ihr Haus liegt an — See neben ein — Wald. Die Kinder laufen durch d — Wald ohne ihr — Eltern und kommen nur zu ihr — Mahlzeiten nach d — Haus zurück.

6 2. (*a.*) Make a complete sentence out of each of the following pairs of sentences:—

(1.) Sie neckten ihn. Er war ſo klein. (weil.)

(2.) Sie kamen alle zuſammen. Sie ſchrieen und pfiffen. (Als.)

(3.) Sie wurden lange nicht einig. Sie ſetzten einen Tag zum Wettfliegen feſt. (Da.)

(*b.*) Turn the second sentence into a relative clause:—

(1.) Die Vögel hielten eine Verſammlung. Sie wollten einen König wählen.

(2.) Er verſteckte ſich in die Federhoſen des Adlers. Dieſer bemerkte es nicht.

(3.) Die Jüngere beſtand auf ihrem Entſchluß. Ihre Geduld ging zu Ende.

Value.

15 3. Change the infinitives in the following sentences to 3rd person singular—present, imperfect and perfect:—

(1.) Der Mann tragen das Kind.

(2.) Der Knabe eſſen ſein Butterbrot.

(3.) Das Mädchen verſtehen die Lehrerin.

(4.) Sein Vater ankommen heute.

(5.) Das Buch gefallen ihm.

12 4. (*a.*) Translate:—

Thank you. Give it to me. He showed it (masc.) to her. They introduced (vorſtellen) him to us.

(*b.*) Rewrite in the passive:—

Der Kutſcher holt den Wagen, Der Sohn erſchoß den Sperber.

(*c.*) Write the comparative and superlative forms of: Der hohe Baum. Er läuft ſchnell.

25 5. Complete the following sentences by inserting appropriate articles, giving correct endings to the adjectives and making the verbs agree—the verbs of the first sentence to be present tense; second, imperfect; third, perfect; fourth, pluperfect; fifth, future. Then rewrite the sentences in the plural throughout:—

(1.) — gut — Kutſcher holen — ſchön — Pferd und groß — Wagen.

(2.) — klein — Zaunkönig verkriechen in — dick — Federhoſen — ſtolz — Adler—.

(3.) — klug — Reiſender wünſchen — bequem — Platz an — warm — ofen zu haben.

(4.) Sein jünger — Bruder bitten um ſein — freundlich — Rat ſein — arm — Freund — halber.

(5.) — alt — Profeſſor zubringen — ganz — Sommer bei ſein — deutſch — Verwandt — in Berlin.

32 6. Translate:—

(1.) He must go to Victoria on Sunday at the latest.

(2.) The farmer, whose son shot the hawk, was angry.

(3.) Your book is larger than hers, but mine is the largest.

(4.) You may go home if you want to. (singular.)

(5.) It happened on Monday, the first of January, nineteen hundred and twelve, at half-past six.

(6.) He likes to play, but he prefers to read.

(7.) There are many beautiful pictures on the walls.

(8.) One morning, a farmer found that his horse had been stolen.

GERMAN TRANSLATION. (Time, 2 hours.)

Value.

48 1. Translate :—

(*a.*) Ein Reisender kam zitternd vor Kälte und ganz naß in ein Wirtshaus. Er wünschte einen Platz am warmen Ofen zu haben, um sich zu wärmen und seine Kleider zu trocknen. Dieser aber war besetzt. Da wandte er sich an den Wirt und sagte: Bringen Sie meinem Pferd ein Dutzend "Austern!" Der Wirt sah ihn erstaunt an und tat was der Reisende verlangt hatte. Zugleich verließen alle Gäste das Zimmer, um zu sehen, ob das Pferd die Austern fressen würde. Nun nahm er den besten Platz am Ofen und machte es sich bequem.

(*b.*) Da beschaut er sich der Menschen Tun und Treiben und liebt es wohl, sie auf allerlei Weise zu necken und sein Spiel mit ihnen zu treiben; denn das müßt ihr wissen, Rübezahl ist ein eigner Kauz, launisch, schadenfroh, heftig, wankelmütig; manchmal aber auch sehr gutmütig und edel; in einem Augenblick ganz weich von Herzen und im andern so hart wie Stein; heute ist er dein Feind, morgen dein Freund, wie's ihm gerade einfällt.

(*c.*) Und siehe, wie sie um eine Biegnng des Weges kamen, stand da — sie trauten ihren Augen kaum — ein Wirtshaus am Wege. An einem langen, kunstvoll geschmiedeten Arme, der über der Tür angebracht war, hing ein grüner Kranz und in seiner Mitte eine herrliche Traube, die schon, von ferne dem durstigen Wanderer entgegenlachte und ihn zur Einkehr einlud. In der Tür des Wirtshauses aber stand der dicke Wirt; eine rote Weste mit großen, blanken Knöpfen bedeckte sein stattliches Bäuchlein; die kurzen, dicken Beine staken in glänzend schwarzen Kniehosen, von denen die schönen roten Strümpfe recht säuberlich abstachen.

(*d.*) Als das Brautpaar aber freudestrahlend aus der Kirche trat, kam ihnen plötzlich der gute Kräutersammler entgegen, wünschte den beiden von Herzen Glück nnd gab der Braut eine blanke Münze in die Hand, indem er sprach: „Beschau sie oft, liebe Susi, und nimm dir dabei vor, stets deine guten Eigenschaften zu bewahren, so wirst du sicherlich das wahre unde echte Glück finden." — Kaum hatte er ausgeredet, so wuchs seine Gestalt riesengroß, um dann plötzlich in den Lüften zu verschwinden. „Rübezahl!" erscholl es plötzlich von aller Munde; denn alle wußten, daß es kein andrer gewesen war, als der Herr der Berge.

12 2. Translate (at sight) :—

Einst gab es große Not unter den Mäusen; denn die Katze war schlau, und es schien, als habe sie ihnen allen den Tod geschworen. Da kamen die Mäuse zusammen und hielten einen Rat. „Was fangen wir an?" sprach die älteste unter ihnen, „unsere Zahl wird täglich kleiner. Bald werden wir von der Erde verschwunden sein. Wie retten wir uns vor der Katze?" — „Nichts ist leichter als das," sprach eine junge Maus, „ich wüßte wohl zu helfen. Wir hängen der Katze eine Schelle an, dann mag sie kommen. Wir haben alle feine Ohren, und ehe sie uns erblickt, haben wir uns schnell verkrochen."

24 3. Translate :—

A poor robin came one day in winter to a farmer's window and pecked upon it because it was so cold outside. When the farmer's son noticed the little bird he opened the window and the robin flew into the warm room. They gave it something to eat, for it was hungry, and the bird soon became quite tame. It remained happily all winter in the house, but, when spring came and the sun shone bright, it became sad. Then the farmer opened the window again and the robin quickly flew out into the garden where it sat in a tree and sang.

16 4. Write in German a short description of the room you are sitting in.

GREEK. (Time, 2 hours.)

Value.

12 1. Decline in agreement: ὁ ἀγαθὸς ἄνθρωπος; πλοῖον μακρόν; ἡ μικρὰ σκηνή.

9 2. Decline in full: οὗτος (all genders), ἐγώ, σύ.

10 3. Illustrate by short sentences in Greek the common meanings of the prepositions διά and περί.

20 4. Give the principal parts of the following verbs: γράφω, βοάω, βούλομαι, πράττω, ἀκούω, φεύγω, ἐθέλω, λαμβάνω, δοκέω, ἡγέομαι.

7 5. How is a "prohibition" expressed in Greek? Give examples.

12 6. Conjugate in full:—

(*a.*) The present optative passive of τιμάω.

(*b.*) The present subjunctive middle of δηλόω.

(*c.*) The first aorist subjunctive active of λύω.

(*d.*) The pluperfect indicative passive of λείπω.

12 7. Translate into Greek:—

(*a.*) I fear they will destroy the bridges.

(*b.*) If he had done this, it would have been well.

(*c.*) We are leading him away that he may not do our friends harm.

(*d.*) I myself shall offer sacrifice in that village.

18 8. Translate into English:—

καὶ δή ποτε ἐν στενῷ καὶ πηλῷ ταῖς ἁμάξαις δυσπορεύτῳ ἔταξεν ὁ Κῦρος δύο ἄρχοντας τῶν Περσῶν λαμβάνειν τοῦ βαρβαρικοῦ στρατεύματος καὶ συνεκβιβάζειν τὰς ἁμάξας. ἐπεὶ δ' ἐδόκουν αὐτῷ σχολαίως ποιεῖν, ὥσπερ ὀργῇ ἐκέλευσε τοὺς περὶ αὐτὸν Πέρσας τοὺς καλοὺς κἀγαθοὺς συνεπισπεύδειν τὰς ἁμάξας. ἔνθα δὴ μέρος τι τῆς εὐταξίας ἦν θεᾶσθαι.

LATIN AUTHORS AND SIGHT TRANSLATION. (Time, 2½ hours.)

A.

Value.

12 1. Translate:—

Huic imperat, quas *possit, adeat* civitates horteturque, ut populi Romani fidem sequantur, seque celeriter eo venturum nuntiet. Volusenus perspectis regionibus omnibus, quantum ei *facultatis* dari potuit, qui navi egredi ac se barbaris committere non *auderet*, quinto die ad Caesarem revertitur quaeque ibi *perspexisset* renuntiat.

(*a.*) Account for the mood of *possit, adeat, auderet, perspexisset*, and for the case of *facultatis*.

11 2. Translate:—

Nam quod omni ex reliquis partibus demesso frumento pars una erat reliqua, suspicati hostes huc nostros esse venturos noctu in silvis *delituerant;* tum *dispersos* depositis armis in *metendo* occupatos subito adorti paucis interfectis reliquos incertis *ordinibus* perturbaverant, simul equitatu atque essedis circumdederant.

(*a.*) Parse *dispersos, metendo, ordinibus*, and give the principal parts of *delituerant*.

Value.

9 3. Translate:—

Caesar exposito exercitu et loco castris idoneo capto, ubi ex captivis cognovit quo in loco hostium copiae consedissent, cohortibus decem ad mare relictis et equitibus trecentis, qui *praesidio* navibus essent, de tertia vigilia ad hostes contendit, eo minus veritus navibus, quod in litore molli atque aperto deligatas ad ancoram relinquebat; et praesidio *navibus*que Q. Atrium praefecit.

(*a.*) Explain the case of *praesidio* and *navibus*.

8 4. Translate:—

Sed ea *celeritate* atque eo impetu milites ierunt, cum *capite* solo ex aqua *exstarent*, ut hostes impetum legionum atque equitum sustinere non *possent*, ripasque dimitterent ac se fugae mandarent.

(*a.*) Account for the case of *celeritate* and *capite*, and for the mood of *exstarent* and *possent*.

B.

14 1. Translate:—

'o socii, neque enim ignari sumus ante malorum,
o passi graviora, dabit deus his quoque finem.
vos et *Scyllaeam* rabiem penitusque sonantes
accestis scopulos, vos et *Cyclopea* saxa
experti: revocate animos, maestumque timorem
mittite; forsan et haec olim meminisse iuvabit.
per varios casus, per tot discrimina rerum
tendimus in Latium, sedes ubi fata quietas
ostendunt; illic fas regna resurgere Troiae.
durate, et vosmet rebus servate secundis.'

(*a.*) Write notes (not more than two lines) on *Scyllaeam* and *Cyclopea*.

10 2. Translate:—

Aeolus haec contra: 'tuus, o *regina*, quid *optes*,
explorare labor; mihi iussa capessere fas est.
tu mihi quodcumque hoc *regni*, tu sceptra Iovemque
concilias, tu das epulis accumbere *divom*,
nimborumque facis tempestatumque potentem.'

(*a.*) Write notes (not more than two lines) on *Aeolus*, *regina*, and explain the mood of *optes*, the case of *regni* and the form *divom*.

7 3. Translate:—

'parce metu, *Cytherea:* manent inmota tuorum
fata tibi; cernes urbem et promissa *Lavini*
moenia, sublimemque feres ad sidera caeli
magnanimum *Aenean;* neque me sententia vertit.

(*a.*) Write notes (not more than two lines) on *Cytherea*, *Lavini*, and *Aenean*.

9 4. Translate:—

constitit, et lacrimans 'quis iam locus,' inquit, '*Achate*,
quae regio in terris nostri non plena laboris?
en *Priamus!* sunt hic etiam sua praemia laudi;
sunt lacrimae rerum et mentem mortalia tangunt.
solve metus; feret haec aliquam tibi fama salutem.'

(*a.*) Write notes (not more than two lines) on *Achate*, *Priamus*.

(*b.*) Scan lines 1 and 2.

C.

20 Translate:—

Erat inter Labienum atque hostem difficili transitu flumen ripisque praeruptis. Hoc neque ipse transire habebat in animo neque hostes transituros existimabat. Augebatur auxiliorum cotidie spes. Loquitur in concilio palam, quoniam

Germani appropinquare dicantur, sese suas exercitusque fortunas in dubium non devocaturum et postero die prima luce castra moturum. Labienus noctu tribunis militum convocatis quid sui sit consilii proponit et, quo facilius hostibus timoris det suspicionem, majore strepitu et tumultu quam populi Romani fert consuetudo castra moveri jubet.

Palam—openly, publicly: Quoniam = cum causal. In dubium devocare—to risk. Fert—is.

LATIN GRAMMAR AND COMPOSITION. (Time, 2 hours.)

Value.

20 1. Write the ablative singular and the genitive plural of *hoc animal, quae vis, eadem navis, major res, totus exercitus.*

5 2. Compare *audax, acriter, diu, parum, similis.*

5 3. Write all the infinitives and participles of *fero.*

8 4. Write:—

(*a.*) The second singular future indicative of *eo.*

(*b.*) The third plural future indicative of *possum.*

(*c.*) The first singular present subjunctive of *volo.*

(*d.*) The first singular imperfect subjunctive passive of *capio.*

(*e.*) The first singular imperfect subjunctive of *fio.*

(*f.*) The third plural perfect subjunctive active of *jubeo.*

(*g.*) The second singular present imperative of *hortor.*

(*h.*) The second singular future indicative of *sequor.*

10 5. Write the principal parts of *consisto, accido, opprimo, desilio, adorior, ignosco, frango, adjuvo, meto, consuesco.*

10 6. Translate into Latin:—

By night; leap down (second plural imperative); on all sides; in a loud voice; it is best to do; at great risk; for what reason; according to custom; as bravely as possible; we are of good courage.

42 7. Translate into Latin:—

(*a.*) Obtaining suitable weather, he set out at dawn.

(*b.*) He used the same material for refitting the ships.

(*c.*) He showed what he wished to be done.

(*d.*) If they send hostages, we shall make peace.

(*e.*) So great a storm suddenly arose that we could not hold our course.

(*f.*) I shall leave you on the mainland to find out what is going on.

(*g.*) He thought it would be of great use to him if he only visited the island.

(*h.*) Learning his design, they promised to collect reinforcements.

(*i.*) Let us urge the neighbouring states to come to treat for peace.

PHYSICS. (Time, 2 hours.)

Value.	
5	1. (*a.*) Distinguish clearly the terms *relative density* and *specific gravity.*
5	(*b.*) The specific gravity of platinum is 21.5, of iridium 22.4. Find the volume of 1 Kg. of an alloy containing 9 parts of platinum to 1 part of iridium.
10	2. Describe fully an experiment to find the relative density of a solid that is lighter than water.
5	3. (*a.*) Discuss the two common types of wave-motion. Upon what does the intensity of a sound depend? Explain fully.
5	(*b.*) A man standing before a cliff shouts, and 3 seconds later hears the echo. How far is he from the cliff? (Temperature 10° C.)
10	4. Show clearly (use drawings) the difference in construction, working, and use of lift-pumps and force-pumps.
10	5. Describe an experiment to show the effect of pressure on the boiling-point. What practical applications are made of this in manufacturing? In high altitudes how do we overcome the difficulties which this change in the boiling-point creates?
10	6. How much heat is required to change 20 gm. of ice at — 10° C. into steam at 100° C.? (Specific heat of ice = 0.5.)
10	7. Explain fully what you understand by refraction and mention various phenomena which can be explained by this principle. (Make drawings.)
5	8. (*a.*) An object is placed in front of a convex mirror. Illustrate and describe the position and relative size of the image.
5	(*b.*) What is a lens? Draw and name the principal classes.
4	9. (*a.*) What is meant by electrical potential? What is the unit for measuring it and what is taken as the standard or zero?
6	(*b.*) What are the uses of a step-up and a step-down transformer? Where and why is each used?
5	10. (*a.*) Describe fully the apparatus necessary to decompose water by an electric current.
5	(*b.*) A constant current is passed through a silver voltameter for 15 minutes, and it is found that 5.031 gm. of silver have been deposited. What is the strength of the current?

University Matriculation (Senior).

ALGEBRA. (Time, 3 hours.)

Value.

7 1. If a, b, c, d are in continued proportion, show that $b+c$ is a mean proportional between $a+b$ and $c+d$.

8 2. Find two numbers in the ratio $1\frac{1}{2}$ to $2\frac{2}{3}$ such that when each is increased by 15, they shall be in the ratio $1\frac{2}{3}$ to $2\frac{1}{2}$.

9 3. The pressure of the wind on a plane area varies jointly as the area and the square of the velocity of the wind. If the pressure on 3 sq. ft. is 4 lb. when the velocity of the wind is 16 miles an hour, find the velocity of the wind when the pressure on 2 sq. yd. is 54 lb.

8 4. Find the quadratic equation each of whose roots exceeds by 2 the roots of the equation $2x^2+3x+5=0$.

10 5. In the following series find the sum to $2n$ terms and, where possible, to infinity :—

(*a.*) $3-2+\frac{4}{3}-\ldots.$

(*b.*) $1\frac{1}{4}-1\frac{1}{3}+1\frac{7}{12}-\frac{4}{5}+1\frac{1}{12}\frac{1}{2}-\frac{2}{5}+\ldots.$

10 6. The digits of a number which lies between 400 and 500 are in A.P., and the number is 70 times the sum of its digits. Find the number.

12 7. (*a.*) Simplify and express with positive indices :—

$$\sqrt[3]{\frac{(2a)^{-2}\,b^{\frac{3}{2}}}{a^{-\frac{1}{2}}(6b)^{-3}}}.$$

(*b.*) Find n when $\sqrt[3]{9^n \times 3^{n-1}} = 6^n \times 2^{-n} \times 3^{n+1}$.

12 8. (*a.*) Find in simplified form the coefficient of x^{-7} in the expansion of

$$(2x^2-\frac{1}{3x^3})^9.$$

(*b.*) Use the binomial theorem to evaluate $(1004)^{\frac{2}{3}}$ correct to 4 places o deci mals

10 9. (*a.*) Prove that $\log(MN) = \log M + \log N$.

(*b.*) Given $\log 2 = .30103$, $\log 3 = .47712$, $\log 7 = .84510$:—

(i.) Find x if $\log x = \bar{4}.47712$.

(ii.) Find the number of digits in $6^{37} \times 21^{14}$.

14 10. How many numbers of 5 digits can be formed, using the digits 0, 1, 2, 3, 4, 5, 6, 7: (*a*) if repetitions are allowed; (*b*) if no repetitions are allowed? In how many of the latter numbers will the digit 0 occur?

CHEMISTRY. (Time, 3 hours.)

[*All questions are of equal value. Answer* ten *only.*]

1. Describe three methods of preparing hydrogen. Illustrate these methods by means of chemical equations and line drawings. What volume of this gas measured at 748 mm. Hg. pressure and 22° C. can be obtained by acting on sulphuric acid with 14.5 grams of zinc? (Zn = 65.4; H = 1.008; S = 32.06; O = 16.00.)

12

2. Explain fully what is indicated by the terms "sublimation," "hydrolysis," "reversible action," and "exothermic reaction." Give examples.

3. Compare the physical and chemical properties of hydrogen chloride, hydrogen bromide, and hydrogen iodide.

4. Describe two methods for the preparation of chlorine and illustrate by means of chemical equations. How can you prove that the formula of chlorine is Cl_2? What is the result of the action of chlorine upon methane?

5. Write as fully as you can regarding the solubility under varying conditions of the sulphides of the common metals.

6. If 35.5 cc. of ammonia, measured at a pressure of 748 mm. Hg. and a temperature of 22.5° C., were entirely decomposed at 750° C., what volume would the resulting gases occupy under a pressure of two atmospheres?

7. Describe a method for the preparation of sodium carbonate. Show by means of chemical equations the various stages of the reactions involved. What are the characteristic properties and chief uses of sodium carbonate?

8. In what form does aluminium occur in nature? How can the metal be isolated on a commercial scale? What properties render the metal useful industrially?

9. What reaction takes place when ethyl alcohol and acetic acid are mixed? What effect will the addition of concentrated sulphuric acid have on this reaction? Show by means of equations how the above reaction is related to the process known as saponification.

10. What is the usual method of preparing a solution of hypochlorous acid? Discuss the properties of this acid and its application to the process of bleaching.

11. How can ethylene be prepared? Give its structural formula and explain the reaction between ethylene and iodine.

(A maximum of fifteen marks will be given for laboratory exercise-books.)

ENGLISH COMPOSITION. (Time, 3 hours.)

Value.

16 1. Write a full, coherent, and effective *paragraph* on *one* of the following topics:—

(*a.*) A character from Chaucer *or* Spenser.

(*b.*) An aspect of Spenser's allegory.

(*c.*) Classical influence upon English Literature in the age of Shakespeare (1564–1616).

Value.

16 2. Apply the principles of (*a*) paragraph coherence and (*b*) exposition in an examination of the following paragraph:—

"There was in Goldwin Smith that note, characteristic of the prophet, that you could not argue with him, for, like other prophets, he was eventually a solitary soul, and did his thinking alone, brooding in silence over all he read or saw, seldom influenced by others. When he began to deliver himself, it would hardly have startled one if the first sentence had been 'Thus saith the Lord.' Without the glowing intensity of Mazzini, he gave the same impression of unshakable conviction. The weakness of this splendid independence is that it often disables a man from following the movements of opinion in the world around him. As Mazzini would never admit that Italy could be free and prosperous except under a republic, Goldwin Smith continued to cling to the ideals and doctrines of his early manhood. Some of those doctrines have been proved to be sound. It would have been well for the British people if they had taken the advice he gave them forty years ago to reconstruct their House of Lords in a deliberate way before a party crisis arrived. But even before old age overtook him he had lost touch with British politics, though he continued to write about them with the old confidence. About seventeen years ago I had from him one letter after another urging that English Liberals should unite themselves and find a live political issue in a campaign for the disestablishing of the Church of England. That was just the time when every careful observer in England had begun to perceive that the sentiment for disestablishment was becoming weaker, because other questions had begun to fill the public mind, and that to raise the issue would bring no strength to any party that raised it. Aversion to ecclesiastical power had been always among the principles he most cherished. It was the only thing he had in common with Froude, whom he heartily distrusted and disliked. Though he had dropped all dogmas, he was of a profoundly religious temper, and held that religion had suffered and would continue to suffer from any connection with the civil power, whether as ruled or as ruler."

18 3. State definitely what is wrong with the following passages and rewrite them correctly:—

(*a*.) Nelson now met the Spanish fleet off Cape St. Vincent, and in the engagement that followed he saw that the Spanish showed signs of retreating, so he disobeyed orders and engaged four of the enemy at once, and the English were victorious.

(*b*.) The opposing side scatters its men so that each one has a certain part of the field to guard, and in order to be in a position to catch the ball when it is kicked.

(*c*.) Chaucer began to write at an early age, and he was a page for some court lady and went to France when she did, and we may presume that his stay there gave him an acquaintance with French literature which was later of service to him.

(*d*.) By placing on file with us a description of your present position, salary, opportunities, evidences of your work, and a few strong references, and also under what conditions you would make a change, this agency feels confident it can be of service to you.

50 4. Write an essay on *one* of the following subjects:—

(*a*.) City (or Town, or Village) Beautifying.

(*b*.) Why Read Spenser?

(*c*.) Effort, the Condition of Success.

ENGLISH LITERATURE. (Time, 3 hours.)

Value.

24 1. Write as fully as you can on each of the following:—

(*a.*) Early Celtic Literature.

(*b.*) Anglo-Saxon War-Poetry.

(*c.*) Confessio Amantis.

(*d.*) Sir Philip Sidney's contribution to English Literature.

(*e.*) Gorboduc and Ralph Roister Doister.

(*f.*) Shakespeare's dramatic contemporaries and their work (Marlowe and Jonson may be omitted for the purposes of this question).

12 2. What were the chief literary, historical, and social influences upon the poetry of: (*a*) Chaucer; (*b*) Spenser; and (*c*) Milton?

Support your statements by definite references to their works.

Answer any *two* of the parts (*a*), (*b*), and (*c*).

20 3. Write on the first book of the "Faerie Queene" under *one* of the following heads:—

(*a.*) A Religious Poem.

(*b.*) A Poem for its Age.

12 4. Quote a passage of at least sixteen consecutive lines from "The Prologue to the Canterbury Tales."

Give some directions for the scansion of Chaucer's lines with suitable illustration from the passage quoted.

14 5. To whom do the following passages allude?

(*a.*) "With scaled browes blake and piled berd."

(*b.*) "And ever he rood the hyndreste of our route."

What traits of character do the lines suggest?

Give full illustration from "The Prologue" of Chaucer's skill in thus *hinting* at the characteristics of his pilgrims.

18 6. Set forth the substance of the scene in "Comus" in which the Lady sits in the enchanted chair. Suggest interpretations of the symbolism of the scene.

FRENCH LANGUAGE. (Time, 3 hours.)

Value.

40 1. Put into French:—

Seeing that I was resolved to risk everything, bursting into tears and taking me into his arms, he cried: "Go, child of nature, regain man's independence of which Lopez would not deprive thee. If I were younger I would go with thee into the wilderness and would restore thee to thy mother's arms. When thou art in thy forests think sometimes of this old Spaniard who gave thee hospitality and recall, that thou mayst love thy neighbour, that thy first experience of the human heart has been all in its favour."

Value.

20 2. Put into French:—

(*a.*) When he comes back he will come and see you.

(*b.*) I have not seen his brother or his sister. No more have I.

(*c.*) He asks for something to eat.

(*d.*) Yes, Colonel, replied the old soldier, *I* took this flag.

(*e.*) I had known him for twenty years.

(*f.*) English was the only language he spoke.

(*g.*) It is possible that it is too late.

(*h.*) She never takes more than one small piece of cake; she eats no more than a sparrow.

(*i.*) Don't you remember what I told you?

(*j.*) The more difficult a thing is, the more it is worth while doing.

10 3. Change the principal sentences in the way indicated and make any other changes thus rendered necessary:—

(*a.*) Cette femme ne parle pas mieux qu'elle écrit. (Take the negative out.)

(*b.*) Je vous assure qu'il a été reçu. (Make negative.)

(*c.*) J'ignorais que vous fussiez arrivé. (Make negative.)

(*d.*) Récitez-moi la poésie que vous savez par coeur. (Substitute *quelque* for *la.*)

10 4. Give the primary tenses of falloir, lire, mourir, concevoir, boire, manger, ouvrir, aller, vivre, voir.

10 5. Give the plural of: un jeu nouveau; un vent glacial; le carnaval de Venise; un beau cheval.

Siepmann asks in one of the exercises for the plural of: *un conseil amical.* Now the masculine plural of *amical* is not used. How would you express this idea (the plural of: *un conseil amical*) in every-day French?

7 6. Make the necessary changes in the verbs in italics:—

(*a.*) Ils se sont *sauver.*

(*b.*) Ils *courir* aux sports qui auront lieu la semaine prochaine.

(*c.*) Il *descendre* (past indefinite) les malles.

(*d.*) Il *naître* (past indefinite) à Paris.

(*e.*) Il *devenir* (pluperfect) riche.

(*f.*) Il *changer* (past definite or preterite) d'habits.

(*g.*) Vous *aller* (past indefinite) trop vite.

3 7. Substitute demonstrative pronouns for the parts printed in italics:—

Quand a-t-il écrit *ces lettres-là?*

Ces champs là sont *les champs* de mon oncle.

Ce qu'il a dit n'est pas vrai.

FRENCH LITERATURE. (Time, 3 hours.)

Value.

10 1. Why is Molière regarded as a great writer of comedy?

10 2. Sometimes reference is made to the dramatic talent of La Fontaine. Why?

10 3. Who were the great prose writers of the eighteenth century? Give some account of their work.

10 4. What do you understand by the term *Romantic Movement?* Who took part in it?

5. Translate the following passages and comment on the words or expressions in italics:—

15 (*a.*)

Mourir sans tirer *ma* raison!
Rechercher un trépas si mortel à ma gloire!
Endurer que l'Espagne impute à ma mémoire
D'avoir mal soutenu l'honneur de ma maison!
Respecter un amour dont mon âme égarée
Voit la perte assurée!
N'écoutons plus ce *penser suborneur*,
Qui ne sert qu'à ma peine
Allons, mon bras; sauvons du moins l'honneur,
Puisqu'après tout il faut perdre Chimène.

15 (*b.*) DON CARLOS (SEUL). Charlemagne, pardon! ces voûtes solitaires
Ne devraient répéter que paroles austères.
Tu t'indignes sans doute à ce bourdonnement
Que nos ambitions font sur ton monument.
—Charlemagne est ici! Comment, sépulcre sombre,
Peux-tu sans éclater contenir si grande ombre?
Es-tu bien là, géant d'un monde créateur,
Et t'y peux-tu coucher de toute ta hauteur?
—Ah! c'est un beau spectacle à ravir la pensée
Que l'Europe ainsi faite et comme il l'a laissée!
Un édifice, avec *deux hommes* au sommet,
Deux chefs élus, auxquels tout roi né se soumet.
Presque tous les états, duchés, fiefs militaires,
Royaumes, marquisats, tous sont héréditaires,
Mais le peuple a parfois son pape ou son césar,
Tout marche, et le hasard corrige le hasard.
De là vient l'équilibre, et toujours l'ordre éclate.

10 (*c.*) Tu ne nous as point donné un coeur pour nous haïr, et des mains pour nous égorger; fais que nous nous aidions mutuellement à supporter le fardeau d'une vie pénible et passagère; que les petites différences entre les vêtements qui couvrent nos débiles corps, entre tous nos langages insuffisants, entre tous nos usages ridicules, entre toutes nos lois imparfaites, entre toutes nos opinions insensées, entre toutes nos conditions si disproportionnées à nos yeux, et si égales devant toi; que toutes ces petites nuances qui distinguent les atomes appelés hommes ne soient pas des signaux de haine et de persécution.

20 (*d.*) Grandet alla, muni de sa fortune liquide et de la dot, muni de deux mille louis d'or, *au district*, où, moyennant deux cents doubles louis offerts par son beau-père au farouche républicain qui surveillait la vente des domaines nationaux, il eut *pour un morceau de pain*, légalement, sinon légitimement, les plus beaux vignobles de l'arrondissement, une vieille abbaye et quelques *métairies*. Les habitants de Saumur étaient peu révolutionnaires; le père Grandet passa pour un homme hardi, un républicain, un patriote, pour un esprit qui donnait dans les nouvelles idées, tandis que le tonnelier donnait tout bonnement dans les vignes.

GEOMETRY. (Time, 3 hours.)

Value.

10 1. (*a.*) Show how to divide a given straight line internally and externally in the ratio of 3 to 2. Give proof.

(*b.*) Construct a square having an area of 6 sq. in. Omit proof.

8 2. Prove that the areas of similar triangles are proportional to the squares on corresponding sides.

12 3. Prove that the rectangle contained by the diagonals of a quadrilateral inscribed in a circle is equal to the sum of the two rectangles contained by its opposite sides.

14 4. O is the centre and OD a radius of a circle. E is any point in OD, and F is taken in OD produced such that OF is a third proportional to OE and OD. If P is any point on the circumference of the circle, prove that the angles FPD and DPE are equal.

14 5. A piece of paper is cut in the form of a triangle ABC having AB = 5 in., BC = 12 in., and AC = 13 in. The triangle is folded so that A and C coincide. Find the length of the crease.

12 6. AB and CD are two given skew lines and P is a given point not on AB or CD. Show how to draw a straight line from P which shall cut the two given skew lines.

12 7. Prove that the sum of any two face angles in a trihedral angle is greater than the third.

8 8. (*a.*) Prove that two skew lines have a common perpendicular.

10 (*b.*) Given two skew lines, show how to draw a straight line from one line to the other so as to make equal angles (not right angles) with each.

GERMAN GRAMMAR AND COMPOSITION. (Time, 3 hours.)

Value.

25 1. Translate :—

Some American students who had been attending the University at Leipzig, wanted to take a vacation trip and see all they could of the country. So they got a map and arranged a tour, which conducted them through the Black Forest to the Rhine. From there they took the beautiful steamer trip to Cologne and saw the picturesque old castles on both banks of the historic river. Arrived at Cologne, they admired the wonderful cathedral, one of the most famous monuments of Gothic architecture in the world. Their return trip to Leipzig was equally interesting, as they took a walking tour through the Harz mountains and so were able to see the places made familiar to them by Heine's charming Harzreise.

40 2. Translate :—

(1.) The professor asked them if they wished to take a long trip.

(2.) The farther they went the more things occurred to them.

(3.) They preferred to take the street car because the Wienhold family was to accompany them.

(4.) Here, waiter, please give us two cups of coffee and fifty pfennigs' worth of rolls and sausages.

(5.) We should enjoy the scenery more, if the window were open.

Value.

(6.) I told the old gentleman that we were not too proud of our pronunciation.

(7.) They took a room at five marks, and asked the porter to have their things brought up.

(8.) Luther is said to have thrown his inkwell at the devil.

(9.) When he had read their letter, he asked for his old friend and was pleased to learn that he was well.

(10.) After introducing them to his wife and daughters, he proposed that they should have coffee together in the garden.

20 3. Translate (at sight) :—

I received a letter a few days ago from my friend in Leipzig, in which he says he intends to spend next term at the University in Breslau because there are too many Americans and English in Leipzig. He declares he has been forced to put off his examination, because it is impossible to become master of German in such a crowd of English-speaking students. I suppose, of course, he understands the language when spoken, and can express himself very well in ordinary conversation, for he wrote me that he had been introduced into a good many refined families in Leipzig. What he wanted, however, was a closer acquaintance with German students, and that seemed quite impossible in Leipzig.

15 4. Write in German, a geographical description of Germany *or* the story of the polite Dutchman.

GERMAN TRANSLATION. (Time, 3 hours.)

Value.

1. Translate :—

8 (*a.*) Er hatte seit Jahren, wo er deren habhaft werden konnte, die im Volke lebenden Reime und Lieder gesammelt, und ging nun daran, seinen Schatz zu ordnen und womöglich mit neuen Aufzeichnungen aus der Umgegend zu vermehren.— Elisabeth war zu allen Zeiten sanft und freundlich; Erichs immer gleichbleibende Aufmerksamkeit nahm sie mit einer fast demütigen Dankbarkeit auf, und Reinhardt dachte mitunter, das heitere Kind von ehedem habe wohl eine weniger stille Frau versprochen.

8 (*b.*) Draußen auf der Straße war es tiefe Dämmerung; er fühlte die frische Winterluft an seiner heißen Stirn. Hie und da fiel der helle Schein eines brennenden Tannenbaums aus den Fenstern, dann und wann hörte man von drinnen das Geräusch von kleinen Pfeifen und Blechtrompeten und dazwischen jubelnde Kinderstimmen. Scharen von Bettelkindern gingen von Haus zu Haus, oder stiegen auf die Treppengeländer und suchten durch die Fenster einen Blick in die versagte Herrlichkeit zu gewinnen.

Value.

2. Translate :—

8 (*a.*) Eine bittere Wehmut umfing sie, das Gefühl, als ob sie aus einer schöneren Welt ausgestoßen wäre und jetzt als ein glückloser Schatten in der Öde herumirre ; denn wenn das Bild auch zu einem Ideal erhoben war, so stellte es gerade dadurch das ursprüngliche innere Wesen Eugenias dar, das durch ihre Schulfuchserei nur verhüllt wurde, und er war ein edleres Gefühl als Eitelkeit, durch welches sie ihr besseres Selbst in dem magischen Mondglanz nun erkannte. Das machte ihr eben zu Mute, wie wenn sie die unrechte Karte ausgespielt hätte, um modern zu reden, da es damals keine Karten gab.

8 (*b.*) „Gieb mir diese Dinge wieder nnd du kannst wohl mein Weib dafür haben!" erwiderte Gebizo bitter lachend, und jener rief blitzschnell : „Es gilt! Suche unter dem Kopfkissen deiner Frau, dort wirst du finden, was für deine ganze Lebenszeit ausreicht, alle Tage ein Kloster zu bauen und tausend Menschen zu speisen, und wenn du hundert Jahre alt würdest ! Dafür bringe mir dein Weib hier zur Stelle, unfehlbar am Abend vor Walpurgistag ! "

3. Translate :—

9 (*a.*) — Und all das Unheil, hat der böse Geist Journalismus angerichtet. Alle Welt klagt über ihn und jedermann möchte ihn für sich benutzen. Mein Oberst hat so lange die Zeitungsschreiber verachtet, bis er selbst einer geworden ist, und Senden läßt keine Gelegenheit vorüber, auf meine guten Freunde von der Feder zu schelten, nur um selbst an ihre Stelle zu treten. Ich sehe kommen, daß Piepenbrink und ich auch noch Journalisten werden und zusammen ein kleines Blatt unter dem Titel : „Der unartige Bolz" herausgeben.

9 (*b.*) Es ist möglich, daß, wie jetzt Sie, auch eine spätere Zeit unsern politischen Hader, unsere Parteibestrebungen und was damit zusammenhängt, sehr niedrig schätzen wird. Es ist möglich, daß unser ganzes Arbeiten resultatlos bleibt ; es ist möglich, daß vieles Gute, das wir ersehnen, sich, wenn es erreicht ist, in das Gegenteil verkehrt, ja es ist höchst wahrscheinlich, daß mein eigner Anteil an dem Kampfe oft peinlich, unerquicklich und durchaus nicht das sein wird, was man eine dankbare Thätigkeit nennt ; aber das alles darf mich nicht abhalten, dem Kampf und Ringen der Zeit, welcher ich angehöre, mein Leben hinzugeben ; denn es ist trotz alledem dieser Kampf das Höchste und Edelste, was die Gegenwart hervorbringt.

8 4. Translate :—

Der Herr kommt siegesbewußt — statt der Skalpe der erschlagenen Feinde trägt er einige Medaillons mit braunen und blonden Locken an der Uhrkette.— Er kommt also und sagt einige gewöhnliche Worte. Man empfängt ihn kalt—sieht ihm scharf in das Auge — und sagt herablassend : „Sehr erfreut." Dann schweigt man und läßt ihn reden — ab und zu ein Wort und ein Blick von der Seite. Je länger er redet — desto eher wird er eine Torheit herausbringen — dann zuckt man die Achseln — lächelt etwas höhnisch — wieder ein Seitenblick — etwa so — als wenn man sagen wollte „Sie machen ja entsetzliche Anstrengungen." Das setzt ihn in Verlegenheit — man winkt ihm gnädig und er geht — um bald wieder an unserer Seite zu sein.

14 5. Discuss briefly the above passages in their proper context.

5 6. Translate :—

(*a.*) Um den Frack ist mir nicht. Das geht nicht. Das wird sich finden Wollen Sie mich zum Besten haben ? Dafür kann man nicht.

Value.

5 (*b.*) Es handelt ſich um deine Ehre. Ich habe es ſatt bei dem Koriolan. Dem geſchieht recht. Es iſt zum Tollwerden. Sie müſſen uns ſchon etwas zu gute halten.

18 7. Write briefly, in German, the story of Immensee, *or* one of Keller's Legenden.

GREEK AUTHORS. (Time, 3 hours.)

Value.

24 1. Translate:—

μέχρι μὲν δὴ τούτων γελάσιμα καὶ μειρακιώδη τὰ εἰρημένα· τὰ μετὰ ταῦτα δὲ οὐκέτι εὐκαταφρόνητα, ὦ ἄνδρες, ἀκούσεσθε, ἀλλὰ καὶ πάνυ φιλικόων ἀκροατῶν δεόμενα· ἵνα γὰρ καθ' Ὅμηρον εἴπω

θεῖός μοι ἐνύπνιον ἦλθεν ὄνειρος
ἀμβροσίην διὰ νύκτα

ἐναργὴς οὕτως, ὥστε μηδὲν ἀπολείπεσθαι τῆς ἀληθείας. ἔτι γοῦν καὶ μετὰ τοσοῦτον χρόνον τά τε σχήματά μοι τῶν φανέντων ἐν τοῖς ὀφθαλμοῖς παραμένει καὶ ἡ φωνὴ τῶν ἀκουσθέντων ἔναυλος· οὕτω σαφῆ πάντα ἦν. δύο γυναῖκες λαβόμεναι ταῖν χεροῖν εἷλκόν με πρὸς ἑαυτὴν ἑκατέρα μάλα βιαίως καὶ καρτερῶς· μικροῦ γοῦν με διεσπάσαντο πρὸς ἀλλήλας φιλοτιμούμεναι· καὶ γὰρ ἄρτι μὲν ἂν ἡ ἑτέρα ἐπεκράτει καὶ παρὰ μικρὸν ὅλον εἶχέ με, ἄρτι δ' ἂν αὖθις ὑπὸ τῆς ἑτέρας εἰχόμην. ἐβόων δὲ πρὸς ἀλλήλας ἑκατέρα, ἡ μέν, ὡς αὐτῆς ὄντα με κεκτῆσθαι βούλοιτο, ἡ δέ, ὡς μάτην τῶν ἀλλοτρίων ἀντιποιοῖτο. ἦν δὲ ἡ μὲν ἐργατικὴ καὶ ἀνδρικὴ καὶ αὐχμηρὰ τὴν κόμην, τῷ χεῖρε τύλων ἀνάπλεως, διεζωσμένη τὴν ἐσθῆτα, τιτάνου καταγέμουσα, οἷος ἦν ὁ θεῖος, ὁπότε ξέοι τοὺς λίθους· ἡ ἑτέρα δὲ μάλα εὐπρόσωπος καὶ τὸ σχῆμα εὐπρεπὴς καὶ κόσμιος τὴν ἀναβολήν. τέλος δ' οὖν ἐφιᾶσί μοι δικάζειν, ὁπότερα βουλοίμην συνεῖναι αὐτῶν.

(*a.*) Explain the construction of ἄν - - - ἐπεκράτει, βούλοιτο, τὴν κόμην, τύλων, ξέοι.
(*b.*) Give the principal parts of ἀκούσεσθε, ἀπολείπεσθαι, φανέντων, παραμένει.

18 2. Translate:—

διελθόντες δὲ καὶ τούτους ἐς τὸ πεδίον ἐσβάλλομεν τὸ Ἀχερούσιον, εὑρίσκομέν τε αὐτόθι τοὺς ἡμιθέους τε καὶ τὰς ἡρωΐνας καὶ τὸν ἄλλον ὅμιλον τῶν νεκρῶν κατὰ ἔθνη καὶ κατὰ φῦλα διαιτωμένους, τοὺς μὲν παλαιοὺς τινας καὶ εὐρωτιῶντας καὶ ὥς φησιν Ὅμηρος, ἀμενηνούς, τοὺς δ' ἔτι νεαλεῖς καὶ συνεστηκότας, καὶ μάλιστα τοὺς Αἰγυπτίους αὐτῶν διὰ τὸ πολυαρκὲς τῆς ταριχείας. τὸ μέντοι διαγιγνώσκειν ἕκαστον οὐ πάνυ τι ἦν ῥᾴδιον· ἅπαντες γὰρ ἀτεχνῶς ἀλλήλοις γίγνονται ὅμοιοι τῶν ὀστῶν γεγυμνωμένων· πλὴν ἀλλὰ μόγις τε καὶ διὰ πολλοῦ ἀναθεωροῦντες αὐτοὺς ἐγιγνώσκομεν. ἔκειντο δ' ἐπ' ἀλλήλοις ἀμαυροὶ καὶ ἄσημοι καὶ οὐδὲν ἔτι τῶν παρ' ἡμῖν καλῶν φυλάττοντες. ἀμέλει πολλῶν ἐν ταὐτῷ σκελετῶν κειμένων καὶ πάντων ὁμοίων φοβερόν τι καὶ διάκενον δεδορκότων καὶ γυμνοὺς τοὺς ὀδόντας προφαινόντων ἠπόρουν πρὸς ἐμαυτόν, ᾧτινι διακρίναιμι τὸν Θερσίτην ἀπὸ τοῦ καλοῦ Νιρέως ἢ τὸν μεταίτην Ἶρον ἀπὸ τοῦ Φαιάκων βασιλέως ἢ Πυρρίαν τὸν μάγειρον ἀπὸ τοῦ Ἀγαμέμνονος.

(*a.*) Explain the construction of διαιτωμένους, ὀστῶν, διακρίναιμι.
(*b.*) Explain the allusions in the last sentence.

Value.

18 3. Translate:—

ΜΙΚ. Ω Ζεῦ τεράστιε καὶ Ἡράκλεις ἀλεξίκακε, τί τὸ κακὸν τοῦτ ἐστίν; ἀνθρωπικῶς ἐλάλησεν ἀλεκτρυών.

ΑΛΕΚ. Εἶτά σοι τέρας εἶναι δοκεῖ τὸ τοιοῦτον, εἰ ὁμόφωνος ὑμῖν εἰμι;

ΜΙΚ. Πῶς γὰρ οὐ τέρας; ἀλλ' ἀποτρέποιτε, ὦ θεοί, τὸ δεινὸν ἀφ' ἡμῶν.

ΑΛΕΚ. Σύ μοι δοκεῖς, ὦ Μίκυλλε, κομιδῇ ἀπαίδευτος εἶναι μηδὲ ἀνεγνωκέναι τὰ Ὁμήρου ποιήματα, ἐν οἷς καὶ ὁ τοῦ Ἀχιλλέως ἵππος ὁ Ξάνθος μακρὰ χαίρειν φράσας τῷ χρεμετίζειν ἔστηκεν ἐν μέσῳ τῷ πολέμῳ διαλεγόμενος ἔπη ὅλα ῥαψῳδῶν, οὐχ ὥσπερ ἐγὼ νῦν ἄνευ τῶν μέτρων, ἀλλὰ καὶ ἐμαντεύετο ἐκεῖνος καὶ τὰ μέλλοντα προεθέσπιζε καὶ οὐδέν τι παράδοξον ἐδόκει ποιεῖν, οὐδὲ ὁ ἀκούων ἐπεκαλεῖτο ὥσπερ σὺ τὸν ἀλεξίκακον ἀποτρόπαιον ἡγούμενος τὸ ἄκουσμα. καίτοι τί ἂν ἐποίησας, εἴ σοι ἡ τῆς Ἀργοῦς τρόπις ἐλάλησεν ἢ Δωδώνη αὐτόφωνος ἐμαντεύσατο, ἢ εἰ βύρσας εἶδες ἑρπούσας καὶ βοῶν κρέα μυκώμενα, ἡμίεφθα, περιπεπαρμένα τοῖς ὀβελοῖς;

(*a.*) Explain the construction of ἀποτρέποιτε, ἀνεγνωκέναι, εἶδες.

(*b.*) Give the principal parts of δοκεῖ, ἀνεγνωκέναι, εἶδες.

(*c.*) Explain the allusions in the last sentence.

τί σεσίγηται δόμος Ἀδμήτου;
ἀλλ' οὐδὲ φίλων πέλας οὐδείς,
ὅστις ἂν εἴποι πότερον φθιμένην
χρὴ βασίλειαν πενθεῖν, ἢ ζῶσ'
ἔτι φῶς λεύσσει Πελίου τόδε παῖς
Ἄλκηστις, ἐμοὶ πᾶσί τ' ἀρίστη
δόξασα γυνὴ
πόσιν εἰς αὐτῆς γεγενῆσθαι.
κλύει τις ἢ στεναγμὸν ἢ
χειρῶν κτύπον κατὰ στέγας
ἢ γόον ὡς πεπραγμένων;
οὐ μὰν οὐδέ τις ἀμφιπόλων
στατίζεται ἀμφὶ πύλας.
εἰ γὰρ μετακύμιος ἅτας,
ὦ Παιάν, φανείης.

(*a.*) Scan the first line and name the metre.

(*b.*) Explain the construction of φανείης.

21 5. Translate:—

ΗΡ. οὗτος, τί σεμνὸν καὶ πεφροντικὸς βλέπεις;
οὐ χρὴ σκυθρωπὸν τοῖς ξένοις τὸν πρόσπολον
εἶναι, δέχεσθαι δ' εὐπροσηγόρῳ φρενί.
σὺ δ' ἄνδρ' ἑταῖρον δεσπότου παρόνθ' ὁρῶν,
στυγνῷ προσώπῳ καὶ συνωφρυωμένῳ
δέχει, θυραίου πήματος σπουδὴν ἔχων.
δεῦρ' ἔλθ', ὅπως ἂν καὶ σοφώτερος γένῃ.
τὰ θνητὰ πράγματ' οἶδας ἥν ἔχει φύσιν;
οἶμαι μὲν οὔ· πόθεν γάρ; ἀλλ' ἄκουέ μου.
βροτοῖς ἅπασι κατθανεῖν ὀφείλεται,
κοὐκ ἔστι θνητῶν ὅστις ἐξεπίσταται
τὴν αὔριον μέλλουσαν εἰ βιώσεται·
τὸ τῆς τύχης γὰρ ἀφανὲς οἳ προβήσεται,
κἄστ' οὐ διδακτὸν οὐδ' ἁλίσκεται τέχνῃ.

(*a.*) Scan the next to the last line and name the metre.

(*b.*) Explain the construction of *οὗτος, σεμνόν, προσώπῳ, ἔχει, θνητῶν.*

(*c.*) Explain the situation, and discuss the character of the speaker and its appropriateness in the play.

(*d.*) Would the play have been improved, if, instead of having one of the characters tell the audience that Admetus begged his friends to die for him the poet had represented this in a separate scene?

GREEK COMPOSITION, SIGHT TRANSLATION, AND HISTORY. (Time, 3 hours.)

A. COMPOSITION.

Value.

50 Translate into Greek :—

(1.) Lucian's father sent him to his uncle so that he might become a sculptor.

(2.) By hard toil they became so famous that people came from all around to see them.

(3.) After Lucian became wealthy (use participial construction), his uncle was glad to see him.

(4.) Alexander fought the Persians for two years before he went to Egypt.

(5.) If Charon takes Menippus in his boat, he will get no fare.

(6.) Hermes said that Menippus was a philosopher.

(7.) Alexander knew that he was greater than the other generals.

(8.) Whoever came to this river was carried over by Charon in a small boat.

(9.) I did not know why he had not come the day before.

(10.) This general saw to it that his soldiers had food.

B. SIGHT TRANSLATION.

A DISASTROUS CAPTURE.

30 *Μάλα δὲ πιεζόμενοι οἱ Θηβαῖοι σπάνει σίτου διὰ τὸ δυοῖν ἐτοῖν μὴ εἰληφέναι καρπὸν ἐκ τῆς γῆς, πέμπουσιν ἐπὶ δυοῖν τριήροιν ἄνδρας εἰς Παγασὰς ἐπὶ σῖτον δέκα τάλαντα δόντες. Ἀλκέτας δὲ ὁ Λακεδαιμόνιος φυλάττων Ὠρεόν, ἐν ᾧ ἐκεῖνοι τὸν σῖτον συνεωνοῦντο, ἐπληρώσατο τρεῖς τριήρεις, ἐπιμεληθεὶς ὅπως μὴ ἐξαγγελθείη. ἐπεὶ δὲ ἀπήγετο ὁ σῖτος, λαμβάνει ὁ Ἀλκέτας τόν τε σῖτον καὶ τὰς τριήρεις, καὶ τοὺς ἄνδρας ἐζώγρησεν οὐκ ἐλάττους ὄντας ἢ τριακοσίους. τούτους δὲ εἶρξεν ἐν τῇ ἀκροπόλει, οὗπερ αὐτὸς ἐσκήνου.*

NOTE.—*ζωγρεῖν* = take prisoners.

C. HISTORY.

20 1. The relations of Athens and Sparta, 479-431 B.C.

2. Causes other than outside military pressure that contributed to the defeat of Athens in the Peloponnesian War.

HISTORY. (Time, 3 hours.)

[*All questions are of equal value. Answer* five *only.*]

1. Trace the development of the English parliamentary system during the 17th and 18th Centuries.

2. What were the leading features of the Old Régime in Europe? Illustrate your answer by reference to 18th Century France.

3. Outline the rôle played by the Jacobins in the French Revolution.

4. Was Napoleon Bonaparte greater in statesmanship than in war?

5. Outline the effects of the Industrial Revolution on 19th Century England.

6. State the problems confronting the Congress of Vienna. To what extent was its solution of the problems satisfactory?

7. "The middle years of the 19th Century witnessed a great revival of nationalism." Discuss with especial reference to Italy and Germany.

8. Sketch the relations between Church and State in France under the Third Republic.

9. To what extent has the history of England since 1832 been a "progress towards democracy"?

10. What is your explanation of the origin of the World War?

(*d.*) Camillus, Fabricius, Marcellus, Flamininus, Cato.

PHYSICS. (Time, 3 hours.)

Value.	
8	1. (*a.*) Write out in full: (1) Pascal's law regarding fluid pressure; (2) laws of transverse vibration of strings; (3) laws of electrolysis; (4) Ohm's law.
7	(*b.*) What is the *molecular theory?* Discuss fully, giving reasons for its acceptance.
5	2. (*a.*) Define: pound-weight, pound-mass, pound-force, foot-pound and poundal.
5	(*b.*) Find the weight of a pound-mass on the surface of the planet Mars, assuming the density of Mars to be seven-tenths that of the earth, its diameter 4,230 miles and the diameter of the earth 7,918 miles.
5	3. (*a.*) Define the unit of: (1) current strength; (2) resistance; (3) E.M.F.
5	(*b.*) The resistance of the filament of an incandescent lamp is 200 ohms, and it carries a current of 6 amperes. Find the amount of heat (in calories) developed in this filament per minute.
5	4. (*a.*) Explain the terms intensity, pitch, and quality as applied to sounds, mentioning upon what each depends and describing the devices for determining or explaining pitch and quality.
5	(*b.*) The wave length of a sound at 59° Fahrenheit is 5 inches. Find its frequency.
5	5. (*a.*) Describe an experiment for finding the specific heat of brass.
5	(*b.*) The weight of a litre of air at standard temperature and pressure is 1.293 gm. Find the weight of 800 c.c. of air at 37° C. and 70 cm. pressure.
5	6. (*a.*) Describe a laboratory method of showing that, when a magnetized steel needle is broken in pieces, each piece becomes a magnet.
5	(*b.*) Show how to electrify positively a piece of metal by friction.
5	7. (*a.*) Discuss the meaning of the dark lines in the solar spectrum.
5	(*b.*) Make a diagram to show how an object is viewed through a compound microscope.
5	8. (*a.*) Write a note on radiant energy, mentioning source, mode of transmission, and effects.
5	(*b.*) A stone is dropped down a deep mine and one second later another stone is dropped. How many feet apart will they be when the first stone has been falling five seconds?
15	9. Laboratory exercise-book, for which a maximum of fifteen marks will be allowed.

TRIGONOMETRY. (Time, 3 hours.)

Value.

1. Prove :—

4 (*a.*) $\tan^2 60° - 2\tan^2 45° = \cot^2 30° - 2\sin^2 30° - \frac{3}{4}\operatorname{cosec}^2 45°$.

6 (*b.*) $\dfrac{\cot(90° - A)\sec A \cot^3 A}{\operatorname{cosec}^2 A \sin^2(90° - A)} = \sqrt{1 + \tan^2 A}$.

10 2. A ship steaming due E. sights at noon a lighthouse bearing N.E., 15 miles distant. At 1.30 p.m. the lighthouse bears N.W. How many knots a day is the ship making? Given 60 knots = 69 miles.

3. Solve for all the positive angles less than four right angles :—

5 (*a.*) $3\tan\theta + \cot\theta = 5\operatorname{cosec}\theta$.

7 (*b.*) $\sin 7\theta = \sin 4\theta - \sin\theta$.

5 (*c.*) $\tan x - \sqrt{3}\cot x + 1 = \sqrt{3}$.

6 4. (*a.*) Prove geometrically that $\sin(A - B) = \sin A \cos B - \cos A \sin B$.

6 (*b.*) Prove geometrically that $\sin(270° - A) = -\cos(360° - A)$.

5. In any triangle prove :—

6 (*a.*) $\sin\dfrac{A}{2} = \sqrt{\dfrac{(s-b)(s-c)}{bc}}$.

6 (*b.*) $\tan\dfrac{A - B}{2} = \dfrac{a-b}{a+b}\cot\dfrac{C}{2}$.

14 6. In the triangle ABC, $a = 9$, $b = 12$, $A = 30°$, find c, given :—

log 9 = .95424. L sin 30° = 9.69897.
log 12 = 1.07918. L sin 11° 48′ 39″ = 9.31108.
log 171 = 2.23301. L sin 41″ 48′ 39″ = 9.82391.
log 368 = 2.56635. L sin 71° 48′ 39″ = 9.97774.

13 7. Find the greatest angle of the triangle whose sides are 183, 195, 214 feet, given
log 82 = 1.9138139. L tan 34° 26′ = 9.8360513.
log 101 = 2.0043214. L tan 34° 27′ = 9.8363221.
log 113 = 2.0530784.
log 296 = 2.4712917.

8. In any triangle prove :—

6 (*a.*) $\sin A + \sin B + \sin C = 4\cos\dfrac{A}{2}\cos\dfrac{B}{2}\cos\dfrac{C}{2}$.

6 (*b.*) $\dfrac{b^2 - c^2}{a}\cos A + \dfrac{c^2 - a^2}{b}\cos B + \dfrac{a^2 - b^2}{c}\cos C = 0$.

ANNUAL REPORT

OF THE

MINISTER OF MINES

FOR THE

YEAR ENDING 31ST DECEMBER

1921

BEING AN ACCOUNT OF

MINING OPERATIONS FOR GOLD, COAL, ETC.

IN THE

PROVINCE OF BRITISH COLUMBIA

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty.
1922.

To His Honour WALTER CAMERON NICHOL,

Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

The Annual Report of the Provincial Mineralogist upon the Mining Industry of the Province for the year 1921 is herewith respectfully submitted.

WILLIAM SLOAN,

Minister of Mines.

Minister of Mines' Office,

February 24th, 1922.

Similkameen River, below Keremeos.

To the Honourable William Sloan,
Minister of Mines.

SIR,—I have the honour to submit herewith my Annual Report on the Mining Industry of the Province for the year ending December 31st, 1921.

The statistical tables give the total mineral output of the Province to date, and show in considerable detail the actual mineral production of the past year, as based on smelter or mill returns; also, a summary of the production of each of the last four years, thus illustrating by comparison the progress made in productive mining during this period.

To facilitate comparison with information previously given, I have retained, as closely as was possible, the general form already established for such tables and for the Report.

I have the honour to be,
Sir,
Your obedient servant,

WILLIAM FLEET ROBERTSON,
Provincial Mineralogist.

Bureau of Mines, Victoria, B.C.,
February 24th, 1922.

MINERAL PRODUCTION OF BRITISH COLUMBIA.

METHOD OF COMPUTING PRODUCTION.

In assembling the output of the lode mines in the following tables, the established custom of this Bureau has been adhered to, viz.: The output of a mine for the year is considered that amount of ore for which the smelter or mill returns have been received during the year. This system does not give the exact amount mined during the year, but rather the amount credited to the mine on the company's books during such year.

For ore shipped in December the smelter returns are not likely to be received until February in the new year, or later, and have, consequently, to be carried over to the credit of such new year. This plan, however, will be found very approximate for each year, and ultimately correct, as ore not credited in one year is credited in the next.

In the lode mines tables, the amount of the shipments has been obtained from certified returns received from the various mines, as provided for in the "Inspection of Metalliferous Mines Act, 1897." In calculating the value of the products, the average prices for the year in the New York Metal Market have been used as a basis. For silver 95 per cent., for lead 90 per cent., and for zinc 85 per cent. of such market prices have been taken. Treatment and other charges have not been deducted, except that in copper the amount of metal actually recovered has been taken, thus covering loss in slags.

TABLE I.—TOTAL PRODUCTION FOR ALL YEARS UP TO AND INCLUDING 1921.

Gold, placer	$ 76,177,403
Gold, lode	105,557,977
Silver	55,259,485
Copper	166,393,488
Lead	48,330,575
Zinc	21,848,531
Coal and coke	225,409,505
Building-stone, bricks, etc.	34,072,016
Miscellaneous minerals, etc	1,210,639
Total	$734,259,619

TABLE II.—PRODUCTION FOR EACH YEAR FROM 1852 TO 1921 (INCLUSIVE).

1852 to 1892 (inclusive)	$ 81,090,069
1893	3,588,413
1894	4,225,717
1895	5,643,042
1896	7,507,956
1897	10,455,268
1898	10,906,861
1899	12,393,131
1900	16,344,751
1901	20,086,780
1902	17,486,550
1903	17,495,954
1904	18,977,359
1905	22,461,325
1906	24,980,546
1907	25,882,560
1908	23,851,277
1909	24,443,025
1910	26,377,066
1911	23,499,072
1912	32,440,800
1913	30,296,398
1914	26,388,825
1915	29,447,508
1916	42,290,462
1917	37,010,392
1918	41,782,474
1919	33,296,313
1920	35,543,084
1921	28,066,641
Total	$734,259,619

Table III. gives a statement in detail of the quantities and value of the different mineral products for the years 1919, 1920, and 1921. It is difficult to get absolutely complete statistics regarding building-stone, lime, bricks, tiles, and other miscellaneous products, but the detail figures shown in Table V. are as nearly accurate as can be obtained.

TABLE III.

QUANTITIES AND VALUE OF MINERAL PRODUCTS FOR 1919, 1920, AND 1921.

TABLE VI.—PLACER GOLD.

Table VI. contains the yearly production of placer gold to date, as determined by the returns sent in by the banks and express companies, of gold transmitted by them to the mints, and from returns sent in by the Gold Commissioners and Mining Recorders. To these yearly amounts one-third was added up to the year 1878; from then to 1895 and from 1898 to 1909, one-fifth; and since then one-tenth, which proportions are considered to represent, approximately, the amount of gold sold of which there is no record. This placer gold contains from 10 to 25 per cent. silver, but the silver value has not been separated from the totals, as it would be insignificant.

YIELD OF PLACER GOLD TO DATE.

PROGRESS OF MINING.

The gross value of the mineral production of the Province for the year 1921 was $28,066,641, a decrease from that of the preceding year of $7,476,443, or equivalent to a decrease of about 21.06 per cent.

While this decrease must be admitted, it is extremely gratifying to find that British Columbia's mining industry has been as well maintained as it has, under the phenomenally strenuous conditions that the industry has had to face during the year 1921.

As mining is a business, the condition of the metal market and of the current prices therein is the first essential to the success of the year's business.

The stagnation of the metal market, with its resultant great diminution in the market prices of all the metals, has been a matter of such common knowledge that a great falling-off in the value of the mineral production for the year 1921 was realized as inevitable and arising from world conditions not in any way connected with our mines; the results obtained will prove a very agreeable surprise, in that the discrepancies prove to be much less than was feared they would be, and in comparison with other mining communities we should consider ourselves very fortunate.

To appreciate how strenuous have been the obstacles with which metal-mining has had to contend with this past year, one has to take a broad view of the general conditions as they exist in the world at large, for our conditions cannot be considered a local matter, as they are governed and controlled by world conditions, and we are but a small factor in the world's production of metals.

Europe is the world's metal market, to which practically all export metals find their way. As Europe is the consumer, the industrial conditions of Europe regulate the consumption of and the demand for the metals.

With the unsettled condition of Europe at the present time, Europe cannot buy our metals; with the result that there has been on this continent a greatly overstocked metal market, which has brought about the usual result, a tremendous drop in the market prices of the metals.

To illustrate what this drop has been during the past year, the following table shows the average market prices of the various metals for the years 1920 and 1921:—

AVERAGE METAL-MARKET PRICES FOR YEAR.

	Silver.	Copper.	Lead.	Zinc.
	Cents.	Cents.	Cents.	Cents.
1920	100.90	17.45	7.96	7.67
1921	62.65	12.50	4.54	4.65
Percentage drop in 1921	37.90	28.36	42.90	39.36

To show what this drop in prices actually means, it might be said that, if exactly the same quantities of metals produced in 1920 had had to be sold at 1921 prices instead of 1920 prices, the value of the 1920 product would have been diminished 31 per cent. solely by such lower prices.

This means that in 1920, on an average, the miners received nearly 50 per cent. greater an amount than for a similar quantity of metals in 1921. This is the financial handicap from outside sources that our miners have had to meet throughout the year, and few of them made a profit at these prices, so that the mining companies deserve great credit for the very good output they made.

Towards the end of the year the costs of mining, including wages and supplies, have been materially decreased, so that the outlook for the next year's mining is somewhat brighter.

To indicate how fluctuating the market has been, charts have been prepared to accompany this Report (pages 15 and 16) which show the monthly fluctuations of metal-market prices from 1913 to date.

It is quite apparent from the charts that there has been a great drop from war-days in all metal prices, but, for all this, it is to be noted that the market prices even at the end of the year are not lower than the normal pre-war prices, at which profitable mining was carried on.

During 1921 all the large copper-producers of this continent, by concerted action, reduced their output to about 25 per cent. of normal, or shut down entirely, so as to reduce the stocks of copper on hand; but we now hear of some of these companies preparing to start up again, which is a sign tending to optimism for the future of the copper market, although it is doubtful if the copper market will go higher than 14 cents a pound for some years yet.

There has been a market for copper at a low price, but during most of the year no demand for lead or zinc, and a great amount of such metals in refined state accumulated at the Trail smelter to an extent that prohibited the purchase of such ore by the custom smelters, which cause absolutely shut down many of the Slocan mines.

During the latter part of the year the Trail smelter, it is reported, was fortunate in finding an outlet in the Orient for the greater part of its accumulated lead and zinc stocks on hand, which again permitted prompt cash payment for ores of these metals to be made, and thus again started up these mines in the Slocan, so that it is probable next year will again see these properties working on a normal basis.

In 1921 the tonnage of lead and of zinc produced was greater than in 1920, due to the large production of the Consolidated Mining & Smelting Company's *Sullivan* mine in East Kootenay.

The amount of copper produced was less in 1921 than in 1920 by nearly 6,000,000 lb., but if the *Britannia* mill had not been burned down late in the fall of 1920, and this property—which can ordinarily be counted on for from 15,000,000 to 20,000,000 lb. of copper—being thus temporarily disabled, this year also there would have been an increase in copper production.

The collieries of British Columbia pretty nearly held their own, having made a net coal production of 2,483,995 tons (2,240 lb.), as against 2,595,125 tons in 1920, a decrease of 111,130 tons, equal to about 4.3 per cent.

With the exception of the year 1920, the net coal-output for 1921 is larger than any other year since 1912, or of any previous year, except 1910.

There was no coke produced in the Coast District by the collieries, although the Anyox smelter converted coal into coke for their own use.

The Crowsnest District produced 59,434 tons (2,240 lb.) of coke, of which about two-thirds was used in Canada and one-third exported to the United States.

The aggregate of the values of British Columbia colliery products in 1921 was $12,836,013, this very nearly equalling the gross value of this year's metalliferous products of $13,153,598.

It is noteworthy that the Northern Coast District produced nearly 70 per cent. to the tonnage of ore mined in British Columbia in 1921, carrying about 55 per cent. of the total value of the metalliferous output of the Province.

The following table shows the number of mines which shipped ore during the year 1921, the districts in which they are situated, and the tonnage produced in each district, together with the number of men employed, both above ground and underground.

In explanation of the table it should be said that, in its preparation, a mine employing twelve men for four months is credited in the table with four men for twelve months, so that the total given is less than the actual number of individuals who worked in the mines during the year.

TABLE SHOWING DISTRIBUTION OF SHIPPING MINES IN 1921.

SUMMARY OF STATISTICAL TABLES.

Referring to the preceding tables of the mineral production of the Province, the following is a summary of their contents:—

TABLE I. shows the total gross value of each mineral product mined in the Province up to the end of 1921, aggregating $734,259,619. From this table it will be seen that coal-mining has produced more than any other separate class of mining, a total of $225,409,505; followed next in importance by copper at $166,393,488, and next in order is lode gold at $105,557,977, with placer gold in fourth place at $76,177,403.

TABLE II. shows the value of the total production of the mines of the Province from 1852 to 1892 (inclusive) and for each year from 1893 to 1921 (inclusive), during which period the output increased tenfold, and had a gross production for the year 1921 of $28,066,641.

The value of the total mineral production of the Province up to the end of 1921 was $734,259,619.

TABLE III. gives the quantities in the customary units of measure, and the values, of the various metals or minerals which go to make up the total of the mineral production of the Province, and also, for the purpose of comparison, similar data for the two preceding years.

The table shows that there has been this year an increase in the production of placer gold of $11,600 and an increase in output of lode gold of $322,762, making a total increase of $334,362 in the total production of the precious metal.

The amount of silver produced this past year was 2,673,389 oz., having a gross value of $1,591,201, a decrease in the number of ounces produced of 704,460.

The table shows an output of lead amounting to 41,402,288 lb., valued at $1,693,354, an increase in quantity of 2,071,070 lb., but a decrease in value of $1,122,761.

The production of copper this year was 39,036,993 lb., valued at $4,879,624, a decrease in amount of 5,850,683 lb., or about 13 per cent. The value of the product was less than that of the preceding year by $2,953,275, due to lower prices.

The other metals are specifically mentioned under the headings which follow this summary.

TABLE IV. shows the proportions of the total mineral productions made in each of the various districts into which the Province is divided.

It will be noted that this year the Southern Coast District has again the honour of first place on the list, followed, in order of importance, by the East Kootenay, Cassiar, West Kootenay, and Boundary Districts. The Southern Coast and East Kootenay Districts owe a considerable proportion of their output to the coal-mines situated within their limits, whereas, in the other districts, the production is chiefly from metal-mining.

The Southern Coast District also derives a fair proportion of its production from "Miscellaneous products," such as building materials, etc., due to the larger cities therein; this year this amounted to $1,744,572, as shown in Table V.

TABLE V. is an endeavour to show in some detail the production of those products, such as building materials, previously summarized under "Miscellaneous products," and which amounts this year to $2,077,030. Much difficulty has been found in obtaining reliable figures regarding these products, and in many cases they have had to be estimated; but, while the figures are not as complete as desired, they are at least approximate, and show what an important branch of mineral production this has become, despite the falling-off due to the war and depressed financial conditions.

TABLE VI. shows the statistical record of the placer mines of the Province from 1858 to 1921, and shows a total production of $76,177,403. The output for 1921 was $233,200, an increase, as compared with the previous year, of $11,600.

TABLE VII. relates entirely to the lode mines of the Province, and shows the quantities and values of the various metals produced each year since the beginning, in 1887, of such mining in the Province. The gross value of the product of these mines to date is $397,390,056; this figure includes the zinc production of 1909 and all subsequent years.

TABLE VIII. contains the statistics of production of the coal-mines of the Province. The total net amount of coal produced to the end of 1921 was 56,693,490 tons (2,240 lb.), worth $201,209,783. Of this, there was produced in 1921 2,483,995 tons valued at $12,419,975. In these figures of coal production the coal used in making coke is not included, as such coal is accounted for in the figures of output of coke. The amount of coal used in making coke in 1921 was 85,644 tons, from which was made 59,434 tons of coke, having a value of $416,038, a decrease in amount from the preceding year of 8,358 tons. The total value of the output of the collieries of the Province in 1921 was $12,836,013.

More detailed statistics as to the coal production of the Province and of the separate districts are given elsewhere in this Report.

TABLE IX. gives the details of production of metalliferous mines of the Province for the years 1918, 1919, 1920, and 1921, and the districts in which such productions were made, showing the tonnage of ore mined in each district, with its metallic contents and its market value.

The total tonnage of ore mined in the Province during the year 1921 was 1,562,645 tons, having a gross value of $12,920,398, and, with the placer gold, a total value of $13,153,598.

The following table shows the tonnage derived from the various districts of the Province:—

Cassiar and Omineca District	1,061,414
Southern Coast District	48,716
Boundary-Yale District	41,658
Slocan Mining Division	5,692
East Kootenay District	298,956
Trail Creek Mining Division	89,107
Ainsworth Mining Division	5,523
Nelson Mining Division	11,048
Other Mining Divisions	531
Total	1,562,645

In reports previous to 1910 there has been included in Table IX. the "Miscellaneous products," and in 1910 these were shown distributed to the various districts; the great increase of these products in the past few years has rendered it advisable that this table be reserved exclusively for metalliferous products, and so a new table (No. V.) was introduced in 1911, giving in some detail the output of these miscellaneous products.

In making comparisons of this table with similar tables in previous reports, the fact that "Miscellaneous" has been removed will have to be borne in mind.

Table X. presents in graphic form the facts shown in figures in the tables, and demonstrates to the eye the rapid growth of lode-mining in the Province, and also the fluctuations to which it has been subject.

It will be seen that, although coal-mining has been a constantly increasing industry during this whole period of thirty years, lode-mining did not begin, practically, until 1894, since when it has risen with remarkable rapidity, though not without interruption, until it reached its maximum in 1916, the $31,500,000 line. The total mineral production in 1910 reached the $26,000,000 line, in 1912 it reached the $32,000,000 line, in 1916 the $42,000,000 line, in 1920 it reached the $35,500,000 line, while this year it is just a little above the $28,000,000 line.

GOLD.

Placer Gold. The recovery of placer gold for 1921 was $233,200, of which practically all was obtained in the Cariboo and Cassiar Districts, only about one-twentieth of the total coming from the other districts. An approximate apportionment is as follows: From Cariboo District, $70,400; Atlin, Stikine, and Liard Divisions of Cassiar District, $146,200; remaining parts of the Province, $16,600. This production for 1921 shows an increase over the preceding year of $11,600, or about 5.2 per cent.

During the past four years the production of placer gold in the Province steadily decreased. The chief reason is to be found in the economic conditions of high prices for labour and supplies, which made placer-mining less profitable than in former years. Shortage of labour also handicapped operations.

Information available regarding the Atlin Division shows that the production was somewhat greater than in 1920, although some of the former operating companies were closed down during the year.

Gold from Lode-mining. The value of lode gold produced in 1921 was $2,804,154, as compared with $2,481,392 in 1920, an increase of $322,762, or about 13 per cent. During the year 1919 the Granby Company closed its mines and smelter in the Boundary-Yale District and therefore made no production in that district during the past year. The low-grade copper ore handled carried small gold and silver values, and in former years this gold production amounted to a considerable total. The *Nickel Plate* mine in this district also made no production, the mine being closed down in September, 1920, remaining closed during 1921, so the output from this district became negligible.

The Rossland mines, which prior to 1917 contributed annually about one-half of the output of lode gold, made a decreased production in 1920 as compared to the preceding year; but during 1921 somewhat recovered, exceeding the 1920 production, but not reaching that of 1919 by 5,000 oz.

The very small gold-output of the Southern Coast District is due to the shut-down of the *Britannia* mine owing to fire and flood.

The following table shows the gold production of 1919, 1920, and 1921:—

District.	1919.	1920.	1921.
	Oz.	Oz.	Oz.
Cassiar District	60,076	54,531	85,185
Rossland (Trail Creek)	50,229	36,425	44,980
Boundary-Yale	33,526	20,687	735
Coast (Southern)	5,514	6,031	750
Lillooet	2,506	120	374
Nelson	297	1,924	3,587
All others	278	330	52
Totals	152,426	120,048	135,663

From the above table it will be seen that the only districts showing marked increases are the Cassiar, Nelson, and Rossland Districts. In the latter case the increase is small. The output in Cassiar is mainly from the *Surf Inlet* mine, and the new shipper—namely, the *Premier* in the Salmon River section. The outlook for the future in this latter district is most promising and a largely increased production of gold and other metals may be expected.

The increase in Nelson Division is mainly due to the *Nugget* mine being again operated. Developments in this district at present under way may bring the production up again to that of former years.

The production of gold in British Columbia during each of the last four years has only been about one-half of the annual output immediately preceding the war, and shows that gold-mining in this Province has, as elsewhere in the world, been adversely affected by the conditions of high costs and a standard price for the product. Nevertheless, from the developments now in progress it would seem that in a short time the annual production of gold in British Columbia should increase considerably.

SILVER.

The quantity of silver produced was 2,673,389 oz., worth $1,591,201, a decrease from the production of 1920 in quantity of 704,460 oz., and a decrease in value of $1,644,779, or nearly 50 per cent.

The market price of silver gradually and steadily fell during the whole year of 1920, but rose again in 1921. The average price for the year 1920 was 100.9 cents an ounce, while for 1921 it was 62,65 cents.

An accompanying diagram illustrates the fluctuations of market prices (pages 15 and 16).

The following table shows the silver production for 1919, 1920, and 1921:—

District.	1919.	1920.	1921.
	Oz.	Oz.	Oz.
Slocan and Slocan City	1,556,714	738,515	188,142
Skeena, Nass, etc.	920,413	1,317,832	1,563,999
Boundary-Yale	231,599	390,994	160,051
Fort Steele	205,500	362,143	546,631
Ainsworth	167,453	266,963	115,772
Rossland	....	....	60,184
Coast (Southern)	104,806	93,417	8,548
Omineca	72,573	103,020	3,745
Windermere-Golden	68,634	53,510	18,508
Nelson	44,280	7,065	2,130
All others	31,147	44,390	5,679
Totals	3,403,119	3,377,849	2,673,389

The above table shows an increase in the silver production from the Skeena and Fort Steele Districts, with decreases in all the others.

The greatest increase was made in the Skeena District and is accounted for by new shippers entering the lists. Of these, the *Premier* and the *Alice Arm* mines give promise of swelling the silver production very materially during future years.

The greatest decrease is found in the Slocan District, where mining has been greatly retarded due to the greatly reduced market value of silver and its associated metals, lead and zinc, which latter two metals were nearly unsaleable for most of the year, and has nothing to do with the mines proper.

It is a pleasing surprise to find a very considerable output in the Boundary-Yale District, despite the cutting-off of the production of the Granby and Canada Copper Corporation, which formerly produced 50 per cent. of the silver of the district.

The silver-output of this district this year is chiefly derived from the *Providence*, *Horn Silver*, *Sally*, and *Bell* mines.

COPPER.

The amount of copper produced in 1921 shows, as compared with the previous year, a decrease in quantity, and owing to the lower market selling-price, a still greater decrease in value. The production was 39,036,993 lb., which is 5,850,683 lb. less than the 1920 output; the value for this year is $4,879,624, which, compared with $7,832,899 made in 1920, shows a decrease of $2,953,275.

The demoralized condition of the copper market during 1919 was referred to somewhat fully in the report for that year, so that it is not necessary to further discuss it here.

The following table shows the production of copper, according to districts, in 1919, 1920, and 1921:—

District.	1919.	1920.	1921.
	Lb.	Lb.	Lb.
Cassiar (Skeena, Nass, etc.)	20,411,421	26,153,406	34,841,767
Coast (Southern)	17,062,100	16,311,962	1,456,146
Boundary-Yale	3,835,516	1,306,515	432,505
Trail Creek Division	1,112,133	1,113,085	2,277,392
All others	38,169	2,708	29,183
Totals	42,459,339	44,887,676	39,036,993

From the above table it will be seen that there has been a large increase in the Skeena and in the Trail Creek Division. In the Coast (Southern) District the main producer has been the *Britannia*, and this property mined and milled a larger tonnage in 1920 than in any previous year; but the mine had its mill burned down almost at the beginning of the year, so that it did no productive mining in 1921, thus depriving the district of an expected output of about 15,000,000 lb. of copper and also of considerable gold and silver.

In June, 1919, the Granby Company was forced to close down the low-grade mines at Phoenix and smelter at Grand Forks, resulting in a great decrease in the copper production of Boundary-Yale District.

The Granby Company made an increased production at its mines and smelter at Anyox, with the result that the copper production was greater than that of last year by about 8,000,000 lb.

The *Marble Bay* mine at Vananda was not operated during the year.

The *Rocher Déboulé* mine, in Omineca Division, was closed all year, with the result that practically no copper was produced in that district.

LEAD.

The total amount of lead produced in 1920 was 41,402,288 lb., valued at $1,693,354. This represents, as compared with the previous year, an increase in quantity of 2,071,070 lb., but a decrease in value of $1,122,761.

Immediately after the Armistice and during early part of 1919 the price of lead in New York fell to 5 cents, but by the end of the year had gradually risen to 8 cents, and remained at about

that price until September, 1920, when, in company with all the other metal prices, it fell rapidly, and at end of the year had reached the pre-war standard of about 4 cents. The average price for 1921 was 4.54 cents.

The following table shows the production of lead, according to districts, for the years 1919, 1920, and 1921:—

District.	1919.	1920.	1921.
	Lb.	Lb.	Lb.
Fort Steele	10,729,483	26,926,319	38,066,820
Slocan	12,156,845	6,135,581	1,614,425
Ainsworth	4,336,602	4,072,807	1,264,845
Windermere-Golden	1,659,279	1,095,486	385,000
Nelson	292,010	719,219	1,301
Grand Forks	.....	.....	51,268
All others	301,749	381,806	18,629
Totals	29,475,968	39,331,218	41,402,288

From the above table it will be seen that there was an increase in Fort Steele and a decrease in all other districts.

The Fort Steele District this year made an output over treble that of 1919, and this year leads all the other districts, producing over 90 per cent. of total lead-output of Province. This great increase is due to the great output of the *Sullivan* mine, owned by the Consolidated Mining and Smelting Company, of Trail. The *North Star* mine produced about 41,202 lb. lead.

In the Slocan District the heaviest producer in 1921 was the *Silversmith*, followed by the *Rosebery-Surprise* and *Standard*.

In the Ainsworth Division the largest producer was the *Florence*, with an output of about 610,205 lb., followed by the *Bluebell*, with approximately 379,520 lb., and thirteen smaller shippers.

The production from Windermere-Golden was chiefly from the *Paradise* mine, with a production of about 385,000 lb.

ZINC.

The quantity of zinc produced in 1921 amounted to 49,419,372 lb., which, compared with 47,208,268 lb. produced in 1920, shows an increase of 2,211,104 lb. This production is valued at $1,952,065, which shows a decrease, as compared with the 1920 value, of $1,125,914, or about 37.5 per cent.

The zinc market was not as much affected as the copper and lead markets by the transition period from war demands to peace conditions, with the result that the price of the metal did not fluctuate greatly and production continued uninterruptedly.

During the latter half of 1920, although the prices of the metal were sustained, there were but small sales and the market for zinc ore disappeared, while many zinc-smelting plants and mines on this continent closed down temporarily at least.

The average price in New York for the year 1921 was about 4.65 cents a pound; the market price at end of the year was about 4.85 cents.

The following table shows the production of zinc, according to districts, for the years 1919, 1920, and 1921.

District.	1919.	1920.	1921.
	Lb.	Lb.	Lb.
Fort Steele	46,460,703	42,881,092	49,319,198
Slocan	10,015,624	3,715,471	65,984
Omineca	224,539	453,512	11,561
Ainsworth	36,785	158,193	22,629
All others	.....	.....	.....
Totals	56,737,651	47,208,268	49,419,372

Some uncertainty was felt as to the production of zinc this year, as labour troubles have been general in the zinc-producing districts and considerable ore has been shipped to the United States.

From the above table it would seem that practically all of the zinc ore mined in the Province this last year was from the Fort Steele District. The output in this district was made chiefly by the *Sullivan* mine, and was due to a large tonnage being sent to the Consolidated Company's electrolytic zinc-refinery at Trail, where the ore is treated.

In the Slocan District the heaviest shipper was the *Bosun*, with a production of 52,612 lb. The next largest shipper was the *Canadian*, followed by the *Ivanhoe*.

The figures for Ainsworth show a greatly decreased production.

The Omineca production is entirely a silver-zinc concentrate from the *Silver Standard* mine at Hazelton.

OTHER MINERALS.

Iron. So far there has been no metallic iron produced in British Columbia, but it has been strongly advocated in many quarters that the conditions are favourable for the establishment of an iron-smelting plant somewhere on the British Columbia coast. So far nothing definite has materialized, although there is apparently a prospect of such a plant being established. As is well known, there is on the Coast, in the aggregate, an adequate supply of magnetite-iron ore, quite sufficiently free from impurities as to be within the "Bessemer limit" to supply ore for such a plant.

Further investigation of the Taseko limonite-deposits was made during 1920 by a party sent out by the Department of Mines. The deposits were also examined in detail by Dr. J. D. MacKenzie, of the Geological Survey of Canada.

The only shipments of iron ore made this past year were 985 tons from the *Good Hope*, Texada island, and 25 tons from the Puget Sound Iron Company, Texada island.

Platinum. The well-known fact of the wide occurrence of platinum throughout the Province in connection with our placer-gold deposits gives reasonable hope that such may be found in payable quantities and justifies further investigations. As far as reports received indicate, the only output this year is about $100 worth from the Similkameen District.

Molybdenite. Since the Armistice the market is dormant, like other metal prices, but nominal quotations vary from 45 to 50 cents a pound. No advice has been received of any shipment this year.

Chromite. In 1918 about 800 tons of chromite ore, carrying from 30 to 45 per cent. chromic oxide, was shipped from the *Mastodon* claim, Grand Forks Division; and a deposit on Scottie creek, near Clinton, was opened up, but no shipments were made. With the end of the war the market for chromite temporarily collapsed, as large stocks were available, with no purchasers in sight. It is believed that no ore was shipped since that date.

No manganese was produced in 1921.

Non-metallic Minerals. About 6,742 tons of fluorspar concentrates was shipped from the *Rock Candy* group, in the Grand Forks Division. This property is owned by the Consolidated Mining and Smelting Company and is equipped to make steady shipments in the future. The growth of this property has been very interesting during the last two or three years. The property is now equipped with an efficient concentrating mill, which produced concentrates carrying about 88.5 per cent. calcium fluoride and 5.3 per cent. silica, and having a total value of about $157,000. The mineral is shipped to Trail smelter and is used for making hydrofluoric acid, which is used in the lead-refinery, and to other points in Canada and to the United States.

The Lillooet Soda Company produced 200 tons of sodium carbonate.

Deposits of hydromagnesite in the Clinton Division, which are reported to be large and of great purity, have attracted considerable attention during the past year. A shipment of 1,000 tons was made to Vancouver.

No arsenic was produced in 1921.

Talc.—Some 167 tons of talc was mined and ground in the Victoria Mining Division, for which product there appears to be a large demand.

Iron Pyrites.—At the *Sullivan* mine in East Kootenay some 1,121 tons of iron pyrites was mined and shipped to Trail.

COAL.

The gross production of coal in 1921 was 2,569,639 long tons, of which 85,644 tons was made into coke, leaving the net production at 2,483,995 tons. These figures show a decrease, as compared with 1920, of 127,135 tons gross and of 111,130 tons net. The quantity of coke made was 59,434 tons, which is a decrease of 8,358 tons as compared with 1920. For purposes of comparison the following table is shown:—

	1916.	1917.	1918.	1919.	1920.	1921.
Coal, gross.....tons, 2,240 lb..	2,485,580	2,398,715	2,578,724	2,408,948	2,696,774	2,569,639
Less made into coke "	401,487	248,740	276,479	141,407	101,649	85,644
Coal, net..... "	2,084,093	2,149,975	2,302,245	2,267,541	2,595,125	2,483,995
Coke made..... "	267,725	159,905	188,967	91,138	67,792	59,434

Summarizing the Provincial gross production of coal, the following table shows the output:—

	1918.	1919.	1920.	1921.
Vancouver Island mines.....tons, 2,240 lb.	1,666,211	1,699,348	1,698,254	1,625,931
Nicola and Similkameen mines..... "	179,179	149,042	149,731	183,153
Crowsnest mines..... "	732,864	558,806	847,389	759,755
Omineca-Telkwa ..... "	470	1,752	1,400	800
Total quantity of coal mined.. "	2,578,724	2,408,948	2,696,774	2,569,639
Less made into coke..... "	276,479	141,407	101,649	85,644
Net quantity of coal produced "	2,302,245	2,267,541	2,595,125	2,483,995

In addition to the above net production of coal, there was made by the collieries the coke production shown in the following table:—

	1918.	1919.	1920.	1921.
Vancouver Island collieries.....tons, 2,240 lb.	24,887	34,071	*Nil*	*Nil*
Nicola and Similkameen collieries... "	*Nil*	*Nil*	*Nil*	*Nil*
Crowsnest District collieries..... "	164,080	57,067	67,792	59,434
Total coke production..... "	188,967	91,138	67,792	59,434

As will be seen from the above figures, the net coal production this year is 111,130 tons less than it was in 1920, and greater than it has been since 1912, except in 1920.

The greater part of the gross Provincial coal production is still being mined by three companies—the Crow's Nest Pass Coal Company of East Kootenay, the Canadian Collieries (Dunsmuir), and the Western Fuel Corporation of Vancouver island, which mined, collectively, 77 per cent. of the gross output.

Of the other collieries: In the Coast District, on Vancouver island, the Pacific Coast Coal Mines, Limited, produced only 29 tons, having been in litigation; the Nanoose Collieries, Limited, 50,206 tons; and the Granby Company, from their colliery near Cassidy, produced 268,962 tons. In the Nicola Valley section of the district, the Middlesboro Colliery Company mined 67,792 tons; the Fleming Coal Company, 35,391 tons; the Princeton Coal and Land Company, 13,966 tons; the Coalmont Colliery, 63,344 tons; and the Chu Chua Colliery, 2,160 tons of coal.

A new coalfield has been opened up in the Omineca District, where a small colliery is being developed on the Telkwa river that last year shipped 800 tons of coal. For convenience this has been included in the Coast District figures.

In the East Kootenay District, in addition to the Crow's Nest Pass Coal Company, which produced 691,824 tons, the Corbin Coal and Coke Company produced 67,931 tons.

The collieries of the Coast District, including the Nicola-Princeton and Telkwa fields, are to be credited this year with about 70 per cent. of the total coal-output.

The gross output of the collieries of the Province for the past year was, as already stated, 2,569,639 tons; there was also 4,718 tons of coal taken from stock.

Of this gross amount, there was sold for consumption in Canada, 1,269,566 tons; sold for consumption in the United States, 815,441 tons; sold in other countries, *nil;* making the total coal sales for the year 2,085,007 tons of 2,240 lb.

In addition to the coal sold, there was used in the manufacture of coke 85,644 tons, and used under companies' boilers, etc., 213,558 tons; while 190,148 tons was lost in washing and screening.

The coke sales of the Province for the past year amounted to 59,970 tons, of which 536 tons was taken from stocks on hand.

The following table indicates the markets in which the coal and coke output of the Province was sold:—

Coal.	Coast District.	Crowsnest Pass District.	Total for Province.
Sold for consumption in Canada ....tons, 2,240 lb.	1,165,305	104,261	1,269,566
" export to United States .... "	320,110	495,331	815,441
" export to other countries .... "	.....	.....	.....
Total coal sales	1,485,415	599,592	2,085,007
Coke.			
Sold for consumption in Canada ....tons, 2,240 lb.	.....	41,878	41,878
" export to United States .... "	.....	18,092	18,092
" export to other countries .... "	.....	.....	.....
Total coke sales	.....	59,970	59,970

COLLIERIES OF COAST DISTRICT.

The collieries of the Coast District, which includes those on Vancouver island and in the Nicola-Princeton fields, and a small colliery on Telkwa river mined 1,809,884 tons of coal in 1921, in addition to which 18,577 tons was taken from stock, making 1,828,461 tons distributed from these collieries in 1921. This amount was distributed thus:—

	Tons.	Tons.
Sold as coal in Canada	1,165,305	
Sold as coal in United States	320,110	
Sold as coal in other countries	*Nil.*	
Total sold as coal		1,485,415
Used under companies' boilers, etc.		152,898
Used in making coke		.....
Lost in washing, etc.		190,148
		1,828,461
Minus coal taken from stock		18,577
Gross output		1,809,884

The total coal sales of the Coast collieries for the year show, as compared with the sales of the previous year, a decrease of 14,112 tons, equivalent to about 1 per cent.

The coal sold in Canada by the collieries of the Coast District this year shows a decrease of 13,624 tons, or about 1.15 per cent. from the preceding year; the amount exported to the United States was 7,159 tons more than the preceding year, an increase of about 2.2 per cent.

There was no coke produced in the Coast District this year.

On Vancouver island five companies produced coal this year—the Canadian Collieries, Limited, the Canadian Western Fuel Company, the Granby Consolidated Mining, Smelting, and Power Company, the Pacific Coast Coal Mines, and the Nanoose Collieries, Limited; the majority of these companies each operate two, or more, collieries. The combined gross output of the Island collieries was 1,625,931 tons.

In the Nicola and Princeton coalfields of the Coast District, the Middlesboro Colliery Company produced 67,792 tons of coal; the Fleming Coal Company, 35,891 tons; the Princeton Colliery, 13,966 tons; the Coalmont Collieries, 63,344 tons; and the Chu Chua Collieries, 2,160 tons.

The total output of this portion of the sub-district was 183,153 tons. The Telkwa Collieries produced 800 tons.

East Kootenay Coalfield.

There were only two companies operating in this district this past year—the Crow's Nest Pass Coal Company, operating two separate collieries, the combined output of which was 691,824 tons; and the Corbin Coal and Coke Company, which made an output of 67,931 tons; making a gross output for the district for 1921 of 759,755 tons of coal.

Of the coal mined, 13,859 tons was added to stock, making the amount of coal distributed from the collieries 745,896 tons.

Of this gross tonnage, 85,644 tons was used in the manufacture of coke, of which there was produced 59,434 tons (2,240 lb.).

The coke sold this year amounted to 59,970 tons, in addition to which 536 tons was taken from stock.

The following table shows the distribution made of the coal of this district:—

	Tons.	Tons.
Sold as coal in Canada	104,261	
Sold as coal in United States	495,331	
Total sold as coal		599,592
Used by the companies in making coke		85,644
Used by the companies under boilers, etc.		60,660
		745,896
Plus coal added to stock		13,859
Gross output		759,755

BUILDING MATERIALS.

The output during 1921 of structural materials, such as cement, lime, building-stone, sand and gravel, brick and other clay products, was less than in the preceding year, being $1,903,799 as against $2,176,460.

Approximately 90 per cent. of the total production of building materials comes from the Coast District, and the larger part of this finds its markets in the Coast cities.

It is probable that an output amounting to about $1,500,000 represents the steady yearly demand for these materials for use in repairs, renewals, and various small demands, with but little new construction-work.

Cement production is less than 1920.

Building-stone.

Public works and several large buildings have caused the quarrying of a good deal of building-stone, and the production in 1921 is valued at $233,650.

Excellent building-stone of various sorts is found in abundance in almost every part of the Province; the fact of its widespread distribution has, however, been somewhat against the establishment of large quarrying industries, as a sufficient local supply could always be obtained, and, except within reach of the larger cities, few regularly equipped quarries have been opened.

On the Coast, chiefly between Vancouver island and the Mainland, there are several well-equipped quarries taking out granite, sandstone, and andesite, all of excellent quality. These quarries supply the stone building material of the Coast cities, and have also exported to the United States.

A detailed description of the more important quarries was given in the Report of this Bureau for 1904.

Red Brick. The sale of red brick during the past year was about 6,000 M.; the price varies from $12 to $18 a thousand, according to quality and demand. This small output shows very clearly that but little construction-work has been carried on. It is probable, however, that a considerable quantity of brick is still imported into the Province.

Firebrick. The only company producing firebrick in the Province is the Clayburn Company, Limited, with a plant at Clayburn. The fireclay is found here as a bed occurring in bedded rocks of Eocene age. Shales, sandstones, and conglomerates, all but little consolidated, make up this sedimentary series. The shales are quarried or mined for brick-making and one bed is an excellent fireclay. Associated with these rocks is a bed of lignite which is sufficiently good to be used for firing the boilers of the plant. Firebrick is the principal manufactured article produced by this company, but, in addition, considerable quantities of common brick, paving-brick, tiles, drain-pipes, and prepared fireclay are made.

Lime. The manufacture of lime is conducted in a small way at a large number of points in the Province, but only on the Coast has any attempt been made at more extensive operations. In the neighbourhood of Victoria, on Esquimalt harbour, two kilns are in operation, and there are two kilns on Saanich inlet. On Texada island —in addition to the plant at Marble bay—a new and extensive plant was erected at Blubber bay a few years ago. The limestone being used is of exceptional purity, but in some instances the limestone-beds are cut by igneous dykes which have to be rejected, and this somewhat increases the cost of quarrying.

The production of lime and limestone for 1921 is valued at $299,191, as compared with $338,151 in 1920; of this about $25,865 worth of limestone was quarried for use as smelter flux by the Granby and Consolidated Companies and $19,595 worth quarried by the paper and pulp mills for their own use.

Portland Cement. There were two large and well-equipped cement plants in the Province, both situated on Saanich inlet. These two concerns have recently been amalgamated under the name of the British Columbia Cement Company, with plant at Tod inlet, which made a production in 1921 of over $600,000. Portland cement is thus the most important item in the production of building materials.

Crushed Rock and Gravel. The returns for crushed rock and gravel indicate an increased demand for this material, although some of the plants have not been in operation for the past two or three years. During the boom years of 1911 and 1912 a number of well-equipped plants were put up near Vancouver and Victoria for supplying washed sand and gravel, properly screened to size. Some of these companies use a system of mining the gravel by hydraulic streams and carrying the product to the screens by the water used.

BUREAU OF MINES.

WORK OF THE YEAR.

The work of the Bureau of Mines naturally increases year by year, this growing activity being due to the following causes: The extension of the mining area of the Province, with the proportional increase in the number of mines; the increasing desire of the outside public for the free information which the Bureau supplies with regard to the various mining districts and camps, and the appreciation by the prospector of the fact that he may obtain, gratis, a determination of any rock or mineral which he may send to the Bureau.

The routine work of the office, and the preparation and publication of the Report for the year just ended, followed by the examination in the field of as many of the mines and mining districts as the season would permit, together with the work of the Laboratory, fully occupied the staff for the year.

The permanent staff of the Bureau now consists of the Provincial Mineralogist and Assayer, Wm. Fleet Robertson; the Assistant Provincial Assayer and Provincial Analyst, D. E. Whittaker; John Adams as Laboratory Assistant; H. T. Nation, general office assistant; and H. Pearson, clerk.

MINERAL SURVEY DISTRICTS AND RESIDENT ENGINEERS THEREOF.

During the session of 1917 the Hon. the Minister of Mines brought in the "Mineral Survey and Development Act," which was passed on May 19th, 1917, and under the provisions of which the Province was divided into six Mineral Districts, to each of which there was appointed a Resident Engineer with headquarters at a centrally located point in such district.

In the district to which he was appointed the Resident Engineer is expected to devote his whole time to the performance of the duties of his office, and to carry on continuously a mineral survey of his district, keeping records of the same and of the mining and mineral developments taking place, and at the same time to assist prospectors and others with such advice as may be necessary and may come within the scope of a mining engineer's work.

Aside from special reports which may be called for by the Minister, the Resident Engineers are expected annually to make a comprehensive report covering all matters relating to mining, mine development, and prospecting that have occurred within the year in their respective districts.

These annual reports of the Resident Engineers are given later in this general Report, and form the basis of the information given in respect to the mineral industry and its development within the Province.

The following are the six Mineral Districts into which the Province is divided, with the Mining Divisions included in each and the location of the permanent office of the district, with the name of the Resident Engineer appointed to each district:—

The North-western Mineral Survey District (No. 1) shall consist of that portion of the Province contained within the following Mining Divisions, that is to say: Atlin, Stikine, Liard, Skeena, Nass River, Portland Canal, Bella Coola, and Queen Charlotte; and shall have its permanent survey station and office at the City of Prince Rupert. Resident Engineer, Geo. A. Clothier, B.Sc.

The North-eastern Mineral Survey District (No. 2) shall consist of that portion of the Province contained within the following Mining Divisions, that is to say: Omineca, Peace River, Cariboo, and Quesnel; and shall have its permanent survey station and office at Hazelton. Resident Engineer, John D. Galloway, M.Sc.

The Central Mineral Survey District (No. 3) shall consist of that portion of the Province contained within the following Mining Divisions, that is to say: Clinton, Lillooet, Kamloops, Ashcroft, Nicola, Vernon, and Yale; and shall have its permanent survey station and office at the City of Kamloops.

It is with much regret that it has to be reported that R. W. Thomson, who has been the Resident Mining Engineer of this district since its establishment in 1917, died at Kamloops on January 6th, 1922, after a lingering illness. A successor to the position has not as yet been appointed.

The Southern Mineral Survey District (No. 4) shall consist of that portion of the Province contained within the following Mining Divisions, that is to say: Similkameen, Greenwood, Grand Forks, and Osoyoos; and shall have its permanent survey station and office at the City of Grand Forks. Resident Engineer, Philip B. Freeland.

The Eastern Mineral Survey District (No. 5) shall consist of that portion of the Province contained within the following Mining Divisions, that is to say: Golden, Windermere, Fort Steele, Ainsworth, Slocan, Slocan City, Trout Lake, Nelson, Arrow Lake, Revelstoke, Lardeau, and Trail Creek; and shall have its permanent survey station and office at the City of Revelstoke. Resident Engineer, A. G. Langley, B.Sc.

The Western Mineral Survey District (No. 6) shall consist of that portion of the Province contained within the following Mining Divisions, that is to say: Nanaimo, Alberni, Clayoquot, Quatsino, Victoria, Vancouver, and New Westminster; and shall have its permanent survey station and office at the City of Nanaimo. Resident Engineer, W. M. Brewer.

ASSAY OFFICE.

The following is a summary of the work of the Assay Office of the Bureau of Mines for the year 1921 as reported by the Assistant Provincial Assayer, D. E. Whittaker:—

During the year 1921 there were made by the staff in the Government Assay Office, 3,455 assays or quantitative determinations; of these the majority were for the Bureau of Mines or for the other departments, for which no fees were received.

The fees collected by the office were as follows:—

Fees for analyses	$ 513 55
Fees for assaying	66 50
Fees for assayers' examinations	240 00
Total cash receipts	$ 820 05
Determinations and examinations made for other Government departments for which no fees were collected—	
Attorney-General's Department	$ 712 00
Agricultural Department	585 00
Board of Health	258 00
Treasury Department	16 65
Other departments	215 00
	$1,786 65
Value of work done outside of Mines Department work	$2,606 70

The value of gold melted during the year 1921 was $775 in 11 lots, as against $3,116 in 15 lots in 1920.

Free Determinations.

In addition to the above quantitative work, a large number of qualitative determinations, or tests, were made in connection with the identification and classification of rocks or minerals sent to the Bureau for a report; of these no count was kept, nor were any fees charged, as it is the established custom of the Bureau to examine and test qualitatively, without charge, samples of minerals sent in from any part of the Province, and to give a report on the same. This has been done for the purpose of encouraging the search for new or rare minerals and ores, and to assist prospectors and others in the discovery of new mining districts, by enabling them to have determined, free of cost, the nature and probable value of any rock they may find. In making these free determinations, the Bureau asks that the locality from which the sample was obtained be given by the sender.

EXAMINATIONS FOR ASSAYERS.

REPORT OF D. E. WHITTAKER, SECRETARY OF BOARD OF EXAMINERS.

I have the honour, as Secretary, to submit the Annual Report for the year 1921 of the Board of Examiners for Certificates of Competency and Licence to Practise Assaying in British Columbia, as established under the "Bureau of Mines Act Amendment Act, 1899."

Examinations were held in Victoria, in the Government Laboratory, on April 11th, May 17th, and December 12th and the following days. Thirteen candidates came up for examination. Seven obtained the required number of marks and the Board recommended that Certificates be granted to them. Three candidates applied for exemption under section 2, subsection (2), of the Act, and the Board recommended that Certificates be issued to them.

In accordance with the recommendation of the Board, Certificates have been duly issued by the Honourable the Minister of Mines to the ten candidates.

LIST OF ASSAYERS HOLDING PROVINCIAL CERTIFICATES OF EFFICIENCY UNDER THE "BUREAU OF MINES ACT AMENDMENT ACT, 1899."

(Only the holders of such certificates may practise assaying in British Columbia.)

NORTH-WESTERN DISTRICT (No. 1).

REPORT OF GEO. A. CLOTHIER, RESIDENT ENGINEER.

INTRODUCTORY.

This district comprises the following eight Mining Divisions of the Province: Bella Coola, Skeena, Queen Charlotte, Nass River, Portland Canal, Stikine, Liard, and Atlin. The southern portion of the district, from Seymour inlet to Portland canal, lies west of the Coast Range summit. The northern portion lies east of the Coast Range summit which forms the Alaska-British Columbia boundary-line, and is therefore behind the Alaska strip. There is consequently a great diversity of geological and geographical conditions which are very favourable for prospecting and mining operations. These conditions have been described in preceding reports, but I think their importance justifies a brief review of their more salient features in this report for the information of new readers, at the risk of uninteresting repetition for readers of former reports.

The chief geological features are the three immense belts, running north-west and south-east, into which the district may be divided. Of these, the all-important one is the granite Coast range of mountains, extending the full length of the Province to near the head of Lynn canal, from which point it gradually merges into the Yukon plateau about Kluane lake. The range is from 60 to 100 miles in width, and its intrusion through the sedimentary formation has created exceptionally favourable conditions along its borders for the circulation of ascending, heated, mineral-bearing solutions and the deposition of their mineral loads, comparatively near the surface, under conditions of diminishing temperature and pressure.

For the purpose of this report, the zone along the eastern border of the granite range is called the Eastern Contact Belt and that west of the range the Western Contact Belt.

The only access to the Eastern Contact Belt in this district is from the Coast, and, unfortunately, the major portion of the belt is behind the Alaska strip, which rather complicates matters in the construction of roads and trails. The Coast range is, however, penetrated in several places by rivers and inlets to its eastern border and can therefore be reached in spots—up the Skeena river (Canadian National Railway); up the Nass river as far as Ayansh; to the heads of Observatory inlet and Portland canal; up the Unuk river; up the Taku river; and from Skagway over the White Pass Railway to the Atlin country.

The principal developments so far have been at Anyox and Alice Arm, at the head of Observatory inlet; Stewart, at the head of Portland canal; and Atlin, at the extreme north end of the Province, about 250 miles from Stewart. In these few isolated spots have been developed the *Dolly Varden*, *Granby* mines, *Premier*, and *Engineer* mines. If these partially prospected areas are any criterion, some idea of the immense potentialities of the balance of the belt may be had. It is the future great mineral-producing zone of the Province.

Everything possible should be done by the Government in the way of opening up navigation and building roads and trails, to keep reconnaissance, prospecting, and development well in advance of the producing areas. To this end a mining-trail should be started from Stewart, the farthest north seaport in the Province, and extended over the Bear River divide to the eastern slope of the Coast range. The slope then followed north to a point on the Stikine river, a straight distance of about 125 miles, keeping as close to the contact mineral-belt as is consistent with the building of a good-grade trail that can eventually be converted into a wagon-road. South of the Bear River pass shorter sections of trail could be built to connect accessible spots; as from the Bear River pass to the Kitsault river and Alice Arm, about 35 miles of trail; from Alice Arm by way of the Illiance river to the Nass river, about 20 miles of new trail; and from the Nass River to Terrace, on the Canadian National Railways, repairing of the present trail of about 70 miles. Altogether this would open up another 125 miles along this belt.

East of the Eastern Contact Belt the whole northern end of the Province, comprising an area of over 90,000 square miles in this district alone, is an unexplored empire in itself. The only route into this area is up the Stikine river to Telegraph Creek and from there by trail

to Dease lake, from which point are waterways. All that is known of it is that several millions of dollars were taken out in placer gold in the vicinity of Dease lake forty years ago. It is an ideal field for exploration, with hydroplanes as the means of transportation, on account of the ideal landings provided in the innumerable lakes that dot the whole country. Two weeks' reconnaissance-work from such a point as Hazelton, the most northerly point on the Canadian National Railways, would map the country sufficiently to select routes of travel and stations. A radius of 300 miles would reach any part of the country. Prospecting parties with supplies could be put down at any desired point, and the extent of exploration would only be limited by the number of parties. By this means more of the northern interior country could be prospected in one or two seasons and more information gained than has been to date, or could be in the next twenty years by present methods.

Though developments are proving that the formations of the Eastern Contact Belt are particularly favourable for the occurrence of the economic minerals, the Coast range and the Western Belt, with their unsurpassed transportation facilities, should not be passed up by the prospector and operator. A low-grade ore that would not pay transportation charges from the interior might make a mine on tide-water. The granite-belt is, as yet, the greatest mineral-producer in the district, from the two mines, the *Belmont-Surf Inlet* at Surf inlet and the *Granby* at Anyox.

There has been a notable increase in the amount of prospecting and exploratory work done in this belt in the past two years, and there are several properties that give good reasons to believe that they will, with development, make shippers.

The Western Belt includes all the Coast islands west of the granite and the Queen Charlotte group. This zone is receiving more attention than heretofore, and a number of showings on the smaller, inshore islands, as well as on the Queen Charlottes, are showing up well with the work being done on them by the owners. Should the steel industry amount to anything on the Pacific coast, the big magnetite and magnetite-chalcopyrite deposits in this belt would no doubt come into prominence.

The Summary Report, 1920, Part A, published this year by the Department of Mines of Canada, contains a preliminary report of S. J. Schofield and George Hansen on the geology and ore occurrences of the Salmon River section. This report, together with the geological map, which has later been issued, gives opportune information to the prospector and mining operator. The detail report will be published early in the year. George Hansen this year completed the Geological Survey work in the Kitsault River section, and the publication of his report and map will be sincerely appreciated by those interested in the development of that area.

THE MINING SITUATION.

The general financial and metal market depression during the year has, of course, not slighted the mining industry of the Province, but the effect on this northern portion of the Province has been surprisingly slight. About the only difference to be noted, in so far as mining is concerned, is that there has been probably less capital with which to take hold of new properties, and also that some of the smaller operators have had to suspend operations and relinquish their options. The latter has not in any way reflected against the merit of the property, for in nearly every case the owners have gone ahead with the development of the property themselves.

Last year's important shippers, with the exception of the *Dolly Varden* at Alice Arm, have been continuously operated and have shipped throughout the year. Very fortunately for the mining industry of this North Coast country, the Granby Consolidated Mining, Smelting, and Power Company has been able to maintain production all year. Though it is estimated that it will take about another year, under present industrial conditions, to absorb the excess reserves of copper, it is expected and hoped that such a calamity as the closing of the Granby plant will be averted. The production of the Premier Gold Mining Company, Limited, of Stewart, of over $1,500,000 this year is indicative of the output that is to be expected from that property in the future. At the *Belmont-Surf Inlet* mine, on Princess Royal island, the completion of a tramway from the *Pugsley* mine, where large ore reserves have been developed, to the concentrator will ensure the production of the property for some time to come. The production of the *Dolly Varden* mine at Alice Arm, under operation for the last two years by the Taylor Engineering Company, has been a disappointment this year and has had a somewhat depressing

effect on that mining section. Little or no development has been done and the tonnage shipped was ore that had been broken down the previous year. The policy of capacity extraction to the exclusion of development-work during the high price of silver was probably a commendable one, but apparently no provision was made for financing development-work when the higher-grade ore was exhausted. Litigation over the *Engineer* mine, on Tagish lake, Atlin, has unfortunately not yet reached the highest Court. The *Maid of Erin* property, in the Rainy Hollow section of the Atlin Mining Division, is developing very satisfactorily and has every appearance of becoming an important shipper of high-grade copper ore as soon as hauling facilities from the mine to tide-water at Haines are provided. There are several other properties throughout the district that are gradually being developed beyond the prospect stage and give reason to believe that they will make shippers. The placers of Atlin, Stikine, and Liard Mining Divisions have made about the same production as last year. Though Ruby and Otter creeks, in the Atlin country, did exceptionally well this year, it is not expected that the present output will ever be very greatly exceeded unless new diggings are struck. In the Liard Division the Dease Lake diggings produced only about $5,000 all told, but with better conditions in sight for next season a greater clean-up is looked for.

A great deal of prospecting has been done in all sections of the district, with results that are surprising the old-timers themselves. It looks, in fact, as if the older mining sections were just beginning to be seriously prospected, with results proportionate to the thoroughness of the work. If some provision to the "Mineral Act" could be devised, eliminating the "claim hog," who is always a "restaker," because it is impossible for him to perform the legal assessments on his many claims, it would compel a great deal more assessment-work, which is the one vital necessity to a mining district; prove a great incentive to the prospector in every way; and remove a very serious handicap to mining progress.

There has been an epidemic of oil-land staking (no rock formation barred) and about 350 locations have been made, principally in the Kitsumgallum and Lakelse valleys, Nass River valley, and Queen Charlotte islands. It is hoped that some one will have the courage of his convictions and do some serious prospecting in the shape of drilling.

A very appreciable amount of assistance was granted by the Department of Mines, under the "Mines Development Act," to prospectors and operators throughout the district for trail-work. In several cases, where widespread damage was done by floods, this assistance was very opportune.

Summarizing the mining situation from a development standpoint, there is an apparent feeling of optimism in all parts of the district, from the prospector up to the producer, and with the brighter outlook of general industrial conditions and consequently more money for mining undertakings, together with reduced costs of labour and supplies, I look for an appreciable increase in exploratory and development work throughout the district the coming year.

The following is a list of the shipping properties in District No. 1 and their outputs for 1921:—

PRODUCTION FOR 1921 FROM DISTRICT NO. 1.

Name of Property.	Location.	Ore mined.	Gold.	Silver.	Copper.
		Tons.	Oz.	Oz.	Lb.
Maid of Erin		55	3	1,808	25,664
Granby Consolidated Mining, Smelting, and Power Co., Ltd.	Anyox	896,802	7,652	314,204	34,067,185
Golskeish Mines, Ltd.	Anyox	9,203	943	3,518	.....
Taylor Engineering Co., Ltd. (Dolly Varden)	Alice arm	1,874	.....	45,648	.....
Premier Gold Mining Co., Ltd.	Stewart	18,750	40,104	1,177,978	.....
Drum Lummon Mines, Ltd.	Drum Lummon bay	4	7	75	4,286
Belmont-Surf Inlet Mines, Ltd	Surf inlet	134,570	36,476	20,706	744,632
North Star		85	.....	1,870	.....
Totals for 1921 (exclusive of placer)		1,061,343	85,185	1,565,807	34,841,767
Totals for 1920 (exclusive of placer)		979,993	56,246	1,375,726	26,153,403
Increase		81,350	28,939	190,081	8,688,364
Decrease		.....	.....	.....	.....

The above list, showing the mineral production of the district for the past year, proves the mining industry to be in a very satisfactory and healthy condition. Not only has the tonnage

mined and the quantity yield of gold, silver, and copper exceeded that of last year, but they have the additional distinction of being the greatest of any year in the history of the Cassiar District. The tonnage mined has gone over the 1,000,000-ton mark and shows an increase of about 9 per cent. over last year. Gold has made the sensational gain of about 60 per cent., amounting to approximately $633,500 over the output of 1920. Silver shows a slight increase in ounces of output, but depreciated $385,000 in value, due to the drop in the average yearly price of 100.9 cents an ounce for 1920 to 62.65 cents an ounce for 1921. Copper also made an increase of nearly 9,000,000 lb., or about 34 per cent. greater than last year, but decreased $208,000 in value on account of the average yearly price dropping from 17.46 cents for 1920 to 12.5 cents a pound for 1921. The gain of $633,500 in gold, however, offsets the depreciation in silver and copper, totalling $593,000, leaving a gain in values of about $40,500 over the output of 1920.

The great increase in gold is due to the wonderful production of the Premier Gold Mining Company, of Stewart, amounting to 40,104 oz., against 2,283 oz. last year. The Belmont-Surf Inlet Mines, Limited, show 36,476 oz., a decrease of about 7,500 oz. from the previous year. Granby fell off a little in gold on account of the quartz mined for flux carrying no values. Last year the gold from this source was 1,715 oz.

It will be noted that the total silver-output was over 1,500,000 oz., of which the Premier Gold Mining Company alone produced over 1,000,000 oz. In 1920 the *Dolly Varden*, of Alice Arm, was the star silver-producer of over 831,000 oz., which apparently was insufficient to maintain operations. *Belmont-Surf Inlet* just about equalled last year's silver yield.

Copper has had a very material increase over last year, due solely to the increased production of nearly 9,000,000 lb. by the Granby Consolidated at Anyox. The *Belmont-Surf Inlet* shows a small increase in copper. The Maid of Erin Silver Mining Company, operating the *Maid of Erin* mine in Rainy Hollow, was able to get out 55 tons of ore before the winter set in. The ore averages about 25 per cent. copper.

Altogether, the district produced 67 per cent. of the total tonnage mined in the Province, yielding 62 per cent. of the total gold, 58 per cent. of the total silver, and 89 per cent. of the total copper, and is the only district in which the value production equals that of last year.

This record, notwithstanding the general industrial depression, is a strong comment on the soundness of the growth of the mining industry in the north-western part of the Province. Previously in this report the mining situation was sized up from the standpoint of prospecting and development, and now, judging it from the standpoint of production, one's predictions must be optimistic.

The Granby Company may be expected to maintain its average yearly output. The Premier Gold Mining Company, with its concentrator and tramway completed and in operation, and its known ore-bodies hardly touched as yet, will no doubt greatly increase its output in the next year or two. The *Belmont-Surf Inlet*, with new tramway facilities for handling the *Pugsley* mine ore to the concentrator, and the opening-up of the ore-bodies on the 1,000-foot level of the old mine, is in a position to maintain its present output and probably increase it next year. As stated before, the *Maid of Erin* mine is developing very satisfactorily and looks very much like an important producer of high-grade copper ore when transportation is provided.

The *Dolly Varden* will in all likelihood be put on a producing basis again. The *Engineer* mine in Atlin, if it ever gets through all the Courts and free of litigation, should develop into an important gold-producer very quickly. The *Silverado* property at Stewart is now mining from a small high-grade vein and there are other large veins on the property that give it great possibilities.

Besides the above shipping mines, there are a number of smaller properties throughout the district, in the Kitsumgallum Lake section, and in the Alice Arm and Stewart districts that are expected to be producing in a small way within the next year.

The district will be reviewed under the main headings of the Mining Divisions, subdivided into sections as follows:—

Queen Charlotte Mining Division—Graham Island section; Moresby Island section.

Bella Coola Mining Division.

Skeena Mining Division—Coast section; Canadian National Railway section; Kitsumgallum Valley section; Lakelse Valley (Thornhill Mountain) section.

Nass River Mining Division—Observatory Inlet section; Hastings Arm section; Alice Arm (proper) section; Kitsault River section; Illiance River section.
Portland Canal Mining Division—Portland Canal (proper) section; Marmot River section; Bear River section; Meziadin Lake section; Salmon River section; Unuk River section.
Stikine Mining Division—Stikine River section; Iskut River section.
Liard Mining Division—Dease Lake section.
Atlin Mining Division—Rainy Hollow section; Atlin Lake section.

QUEEN CHARLOTTE MINING DIVISION.

The mining situation on the islands has not changed very materially since last year's report. About the only work being done is by the owners on their own holdings.

Graham Island Section.

In the early part of the summer it looked as if something were going to be done toward developing the oil-shale industry on the western slope of this island. A large area of ground had been acquired and considerable prospecting and exploratory work done in defining the oil-shale belt and obtaining a fairly accurate estimate of the probable tonnage, which was said to be entirely satisfactory. Many field tests were made of the shale and large samples procured and shipped for exhaustive experiments. It was reported by Nick Clark, one of the principals in the undertaking, that the shales from the surface averaged about 10 gallons to the ton and that the oil content improved as more depth was attained, and also that a satisfactory process for the extraction and refining of the oil on the ground had been worked out. Shales with anything over 25 gallons to the ton could be worked at a profit, and to this end successful experiments had been made along the lines of concentration of the shales before retorting for the elimination of the less oil-saturated particles of silica. This concentration was about 4 or 5 into 1 and the concentrated shale ran well over 30 gallons to the ton.

Analyses of the shale-oil were given as: Gasolene, 15 per cent.; kerosene, 14 per cent.; gas oil or distillate, 18 per cent.; light lubricating-oil, 17 per cent.; heavy lubricating-oil, 28 per cent.; residue, 8 per cent.

Their holdings have been kept in good standing, but nothing further has been done in connection with the shales. The principals have probably gone to the Mackenzie basin.

The black, gold-bearing beach sands on the north and east coasts of Graham Island is another hardy annual. A number of leases have been taken up for next spring's operations.

South Easter Group.—(*See* report of 1918, page 37.) Nothing of any note has been done on the property this year.

Moresby Island Section.

The west coast of Moresby, around Gold and Kootenay harbours, has had considerable prospecting during the past year or two and a number of small free-gold quartz veins characteristic of that area have been found.

Early Bird Group. The reader is referred to the 1918 report, page 41, for a description of this property. It is owned by J. G. McLellan, of Queen Charlotte City, and situated on Gold harbour. Nothing has been done by the owner on the property for some years, but I understand that it is now under lease to Davey & Pearsen, who are getting fair returns for their work.

Blue Mule Group. This group was reported on last year, 1920, since which time the owners, Jones, Wiggs & McRae, have done further work and, I am informed, have opened up some very promising showings of free-gold ore. I regret that I have been unable to get to the property this year. It is reported that one of the owners, J. H. Jones, and Nels Larsen have taken a lease on the property for three years and are now engaged in development-work.

Homestake Group. This is an old property on the north side of Cumshewa inlet, on which considerable work was done several years ago, and from which some small shipments of rich, very closely hand-sorted ore was shipped. It was reported on in 1913 Minister of Mines' Report by D. G. Forbes, who says in part that there are two ledges, a north and south one, lying in a shattered zone of slate, between slate and siliceous limestone formations. The gangue is quartz and calcite and the mineralization pyrite, zinc-

blende, and a little galena. A drift was run on the north vein for 239 feet and on the south vein for 435 feet, with crosscuts, winzes, etc., totalling over 2,000 feet of work. The general tenure of the ore is low except where galena is found, when the values go up as high as $100 to the ton in gold. It is reported that this property will resume operations at an early date.

Iron Duke Group. This group is situated on Louise island and is a very promising-looking magnetite-iron property, judging from surface indications. The claims have been surveyed this summer and applications made for certificates of improvements for Crown grants. The reader is referred to the Minister of Mines' Report, 1918, for more detailed information.

Swede Group. This group of eight claims, owned by Rogers, Pearsen & Larsen, lies just to the left of the entrance to Lockeport harbour, on the east coast of Moresby island. The claims contain an immense deposit of low-grade copper ore consisting of chalcopyrite and bornite, disseminated and in small bunches and veinlets throughout a diabase country-rock. Two tunnels have been driven, one 170 feet and another, farther north, 80 feet. They both show disseminated chalcopyrite, but the latter has also a small percentage of bornite scattered through it. The bornite carries a little platinum in the best of it, a sample assaying 3.1 per cent. copper, showing 0.01 oz. platinum and a trace of palladium, 20 cents in gold, and 1 oz. silver to the ton. The owners are only keeping up assessment requirements. The property is ideally located for working on any scale.

Ellen Group. This group is situated on Shuttle island, about 7 miles south of Lockeport. There are four claims in the group—*Ellen*, *Georgia Mac.*, *Bald Eagle Frac.*, and *Aeroplane*—owned by Edwards and partner. The group was bonded early in the year to Archie McVittie, of Victoria, who was to have installed a small mill of the Ross type. However, nothing much seems to have been done.

The owners had been working pretty steadily on the property and did considerable work, mainly on the *Ellen* claim. It consists of a crosscut tunnel 100 feet long, following a small quartz stringer to its junction with the main quartz vein, gaining a depth of 25 or 30 feet in that distance. The main vein was then drifted on for 25 feet and a shaft sunk to a depth of 26 feet at the intersection of the veins. This work discloses a brecciated quartz-slate vein-filling, averaging about a foot in width, in a slaty country-rock. Free gold occurs in the vein, some in the quartz, but mainly around and in the inclusions of country-rock. Some fine specimens have been obtained, but the values are very spotted and the general average, I judge, would be low.

Tickscy Placer Claim.—This claim, on the beach on Shuttle island, is being worked by the three owners. They are installing a small pumping plant to supply a head of water for sluicing. The extent of gravel is pretty small to be of great importance.

Copper Island.—The owner of the claims on this island, just outside Jedway harbour, Mr. Heino, has been working on these and his iron claims on Burnaby island all summer. I regret that I have been unable to get over this fall and also that I have no information as to the outcome of his season's work.

Burnaby Island.—Campbell & Wildes have done some work on their claims, the *Bank of Commerce* and *Mother Lode*, with, it is reported, very good results.

Ikeda Mines, Ltd.—Operations have not been resumed since closing down last year.

Thunder Group.—This group is owned by Ike Thompson, of Jedway, and situated on Collison bay. It was optioned this spring to Seattle interests, but as yet nothing has been done on the property.

BELLA COOLA MINING DIVISION.

I have been unable, owing to lack of time, to get over this Division this year and consequently can only report from office statistics that the yearly assessments have been kept up. Last year gave some hope that an iron ore (magnetite) industry might be developed, but none has been mined or shipped this year.

SKEENA MINING DIVISION.

This Division takes in about 200 miles in length of the Coast range; the coast-line and islands to the mouth of Portland inlet; and also includes a small portion of the Eastern Contact Belt, from Lakelse lake north to the southern boundary of the Nass River Mining Division.

The Coast granites are made easily accessible by hundreds of miles of canals and inlets, notably Douglas channel, Gardner canal, and Kitimat arm. The interior is reached by the

Canadian National Railway, from which access is had to the Lakelse and Kitsumgallum valleys from Terrace. A great deal of prospecting has been done along the Coast and on the islands, and the Kitsumgallum Valley section has been quite active, especially in the vicinity of Kitsumgallum lake. The latter does not refer to the oil-land staking, but to mining. There is at present only one shipping property in this Division, the *Belmont-Surf Inlet* on Princess Royal island.

Coast Section.

This includes all the Coast islands and any part of the Mainland on tide-water, and is one of the least expensive and most accessible portions of the Province for prospecting.

Belmont-Surf Inlet Mines, Ltd.

The mining property of this company is situated at the head of Surf inlet, on the west coast of Princess Royal island. The company, which is subsidiary to the Tonopah-Belmont Development Company, has been shipping from this property since 1917. During that time up to the end of 1921 about 500,000 tons of ore has been mined and milled, yielding approximately 175,000 oz. gold, 100,000 oz. silver, and 2,700,000 lb. copper.

This year has been the biggest yet in point of tonnage mined and milled, amounting to about 135,000 tons, or an average of nearly 400 tons a day treated in the concentrator. This tonnage of mine-run ore produced 11,483 tons of flotation concentrates shipped to Tacoma and yielding 36,476 oz. gold, 20,706 oz. silver, and 744,632 lb. copper, a small increase in silver and copper over last year, but a decrease of about 8,000 oz. gold.

The year's work consisted mainly of stoping from the upper levels, the sinking of a winze from the 900-foot to the 1,000-foot level, and driving laterals on the lower level. The total footage of drifting and crosscutting for the year was about 5,000 feet and the winze and raises about 2,600 feet. The number of men employed would average about 200 throughout the year.

The main working-shaft from the 550-foot level, the main haulage level of the mine, will now be sunk from the 900-foot to the 1,000-foot level and in all probability will be continued another level. The vein and ore on the lowest level are reported as being very satisfactory.

A 2-bucket, high-speed, reversible tram has been installed this summer from the lower tunnel of the *Pugsley* mine, owned by the company, to the crusher-bin at the mine, from which the ore is carried by travelling-belt to the concentrator. The tram is a single span of 2,300 feet, of 1⅜-inch smooth-coil track-cable and ½-inch traction-cable operated by a 25-horse-power motor geared to an 8-foot bull-wheel. Its capacity is about 12 tons an hour and hoists to an elevation of about 400 feet above the lower terminal. The tram was put in operation about the middle of September.

At the *Pugsley* mine a raise has been put through from the lower to the upper tunnel, a distance of 245 feet, and several stopes are now being opened up on the lower levels preparatory to supplying ore to the concentrator.

F. H. Penn, former mill superintendent, is now general superintendent at the mine, succeeding F. W. Holler, resigned. E. W. Hawkins is auditor and Cliff Seale, mine superintendent.

Cordila Group.

This group consisting of six claims—*Mountain View*, *Royal*, *Landslide*, *Bight*, *Counder*, and *Present*—staked in July, 1920, by Corila & Koski, is situated on the north end of Princess Royal island just back of Rivers bight. A working bond was taken on the property this fall and work started by the Rivers Bight Syndicate. I did not have an opportunity of seeing the property this fall, but it is reported that the work is progressing well and the showing much the same as the *Surf Inlet* mine.

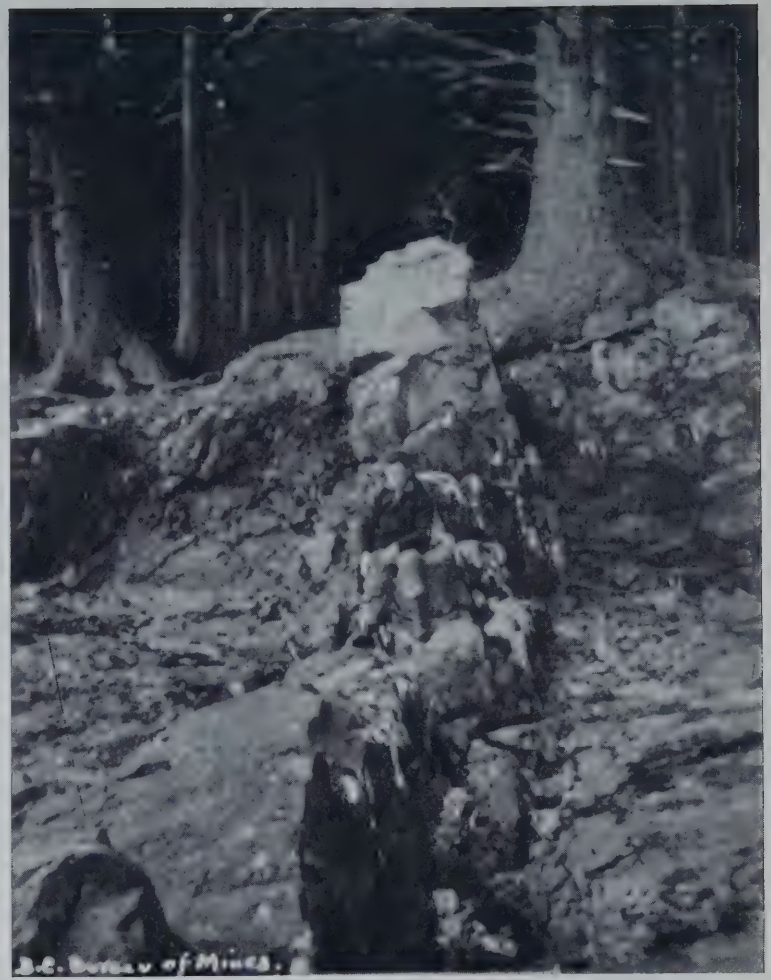
Payroll Group.

This group consists of two claims on Kiltuish or Long inlet, owned by Jas. Hickey and partner, of Prince Rupert. Assessment-work was done on the claims this summer by the owners, who report the vein to be exposed for a width of 20 feet. It is quartz in a country-rock of hornblende-schist, mineralized with pyrrhotite and a little chalcopyrite scattered through it. Gold values are spotted, varying from a trace to $14 to the ton. The showing is right on the beach and the ore could therefore be mined and shipped at minimum cost.

Stewart Group.

This group is situated on the Kemano river, about 6 miles up from Gardner canal. The property has hitherto been rather inaccessible, except at certain stages of the water in the river, when poling and lining could be used. A trail was cut this summer from the mouth of the river up the west side to a point opposite the creek up which the claims lie. The showings have been described as a mineralized dyke 200 feet

Alder Island—Open-cut on Gatt's Claim.



Alder Island—Dyke on Gatt's Claim.

wide lying in the granodiorite of the Coast range. Gold, silver, and copper values are found throughout the dyke, but there are small veins of ore in places of better grade.

The property is owned by M. M. Stephens and Captain Babbington, of Prince Rupert. Mr. Stephens brought in some samples this fall from the property of very promising-looking quartz mineralized with bornite and chalcopyrite and carrying gold and silver values.

Douglas Channel Mines.

(Formerly Drum Lummon Mines, Limited (Non-personal Liability).) This company was incorporated in June of this year, with a capitalization of $3,000,000, divided into 3,000,000 shares, with its head office in the Credit Foncier Building., Vancouver. The old company, the Drum Lummon Mines, Limited, deeded thirteen Crown-granted mineral claims, including the *Drum Lummon* mine, to the new company, retaining two mineral claims and obtaining a considerable portion of the stock of the new company. The old name was changed to the Douglas Channel Mines.

The new company's holdings are being developed by contract with the Glenville A. Collins, Engineers, Limited, of Vancouver. Under this new management a great deal of work has been done this summer, including the dismantling of the old mill, the erection of a larger camp and a snow-shed at the mouth of the tunnel, moving of the compressor to housing at the mouth of the tunnel, and the sinking of a winze on the vein on an angle of 45° to a depth of 100 feet. This winze-sinking is now being pushed as rapidly as possible, and when the desired depth is attained another level will be driven to the west on the vein. It is also intended to continue the present level another 100 feet on the vein and complete the raise through from this level to the surface for ventilation.

A favourable smelting rate has been procured from Granby Consolidated and it is contemplated shipping the siliceous mine-run ore to the Anyox plant. About 5 tons of ore was shipped to Granby this summer, assaying 50.6 per cent. copper, 17.7 oz. silver, and 1.67 oz. gold to the ton.

Mr. Collins, manager, informs me that the work is progressing satisfactorily and that, everything considered, the property is looking very promising.

Canadian National Railways Section.

This section includes all the country contiguous to the railroad, from Prince Rupert to Terrace, a distance of 95 miles, and is practically all in the granite Coast range. There has been little real prospecting done along the railroad, though in the early boat-days up the Skeena river many claims were staked along the river. Little or no prospecting has been done away from the railroad or river, but a little more interest is being taken each year.

Graphite Group.

This is a group of claims lying on the south side of the Skeena river, about opposite the station of Salvus, 60 miles from Prince Rupert. They were staked and are owned by Doc Stanwood and Phil Chesley. I was over the ground this fall and found that owing to the heavy overburden and the consequent few exposures of the rock formations, it was extremely difficult to "size it up" and arrive at any conclusions as to the possibilities of the property.

Graphite is found in a belt of more or less metamorphosed granite, probably 1,000 feet in width and several miles long. There seems to have been a profound movement in this belt or zone, splitting it up in all directions and forming bands, of considerable widths, of gneissoid granite. Along the seams in the granite and in the gneiss bands there has been considerable alteration and decomposition of the granite. The graphite occurs in minute flakes mainly along the fracture-faces, but possibly disseminated throughout the altered granite. It would require a thorough examination of the property and probably extensive exploratory work to determine whether the graphite content is sufficient for commercial ore. The owners claim an assay of 3 per cent. graphite across a width of 400 feet about the centre of the zone, and also to have obtained gold values of $1.75 to the ton from different places.

Kitsumgallum Valley Section.

There was considerable activity in this section this year, both in prospecting and development-work. Two or three parties were prospecting on Maroon mountain and others at the head of Douglas creek. A party of four also made a three-weeks' trip up the Beaver river from the head of Kitsumgallum lake. They report that the South fork of Beaver is all in granite, but that there is a good-looking country for prospecting all along the North fork.

This section lies along the Eastern Contact Belt and is a worth-while accessible country to prospect, from Terrace to the Nass River, a distance of about 70 miles. This summer I walked through on the Telegraph trail and took a pack-horse from the head of the lake to Ayaush, on the Nass river, about 40 miles, and found the trail badly in need of repairs, rebuilding, and clearing out for several stretches. No time could be taken for any reconnaissance off the trail. The rock formation is, apparently, predominantly metamorphosed sedimentaries, with numerous granite dykes and spurs and other igneous intrusions. I should judge it a very favourable belt for mineralization.

Recommendations have been made to the Geological Survey of Canada for as detailed reconnaissance as possible of the area around Kitsumgallum lake and through to the Nass river.

A considerable area north of the lake has been covered with oil locations by the Kitsumgallum Basin Petroleum Company, Limited, with its head office at Terrace. From the south end of the lake to Terrace and the Lakelse valley has been blanketed by other parties for a distance of 20 miles. The prospectus of the Petroleum Company and the statements of those interested in the other locations leave nothing to be doubted as to the existence of oil in commercial quantities, but drilling would be a good idea. The proximity to the Coast Range granites is probably not a promising feature.

Motherlode Group.

There are three claims in this group—the *Motherlode*, *New York*, and *B.C.*—owned by Oscar Gendron, Jack Couture, Oscar Olander, and Paul Brodine, of Terrace. The claims are situated at the head of the South fork of Falls creek, about 5 miles by trail from the head of Kitsumgallum lake. There is a good horse-trail built by the owners through to the *Bear* group, a branch trail from it going to the *Motherlode* cabin, which is at an elevation of 5,200 feet.

The owners claim that there is a mineralization above the bluffs cropping for a width of from 30 to 50 feet, and this is evidenced by the quantity of float found in the slide at the foot of the bluff. They started a tunnel at 5,600 feet elevation last year and drove it 30 feet, cutting a little ore at the mouth of the tunnel. The balance of the tunnel is in an andesitic dyke, which intrudes and is interbedded with the altered sedimentaries, which is the predominating country-rock. This tunnel was abandoned and another started 200 feet vertically lower, with the idea of cutting the ore which shows in the mouth of the tunnel above. This lower tunnel had at the time of my examination (August 14th) been driven 15 feet into the slide-rock, which, fortunately, is cemented with ice and good driving. Since there is plenty of ore float above the upper tunnel, I advised the continuation of that tunnel through the andesitic dyke. I have no information as to later development.

The float found is a schistose rock in which are bands of quartz mineralized with zinc-blende, galena, chalcopyrite, a little grey-copper, and an occasional flake of native silver. I think there is a good chance of opening up a body of milling-grade ore.

Black Wolf and Golden Eagle.

These groups of two claims each were located this spring by the owners of the *Motherlode* group on the extension of the *Bear* vein. The *Black Wolf* is on the south and the *Golden Eagle* on the north end of the *Bear* group. The vein has been traced on the surface through both groups, the northerly extension striking across the head of Falls creek into Goat mountain. The vein is small, from 8 to 12 inches wide, and lies in a schistose country-rock, conforming with its strike and dip. It consists of quartz more or less mineralized with galena, zinc-blende, and pyrite, but in places is composed entirely of sulphides. Gold can be panned anywhere along the vein, the decomposed and honeycombed quartz being especially rich. A sample of about 10 lb. was taken from different parts of the vein, of average vein material, ground up in a mortar and panned. The concentrates after amalgamation assayed $192 in gold and 12.2 oz. in silver to the ton and 22 per cent. lead. The tailings assayed $6 in gold, 2.6 oz. silver, 4 per cent. lead, and 70 per cent. insoluble.

Seattle interests, represented by Mr. Hore, have taken a lease and bond on these two groups and, I understand, expect to have a small mill in operation early next spring.

Bear Group.

This group is situated at the head of the North fork of Falls creek and north of the *Motherlode* group. There are four claims in the group—*Bear*, *Hawk*, *Whistler*, and *Goat*—owned by Matt Allard, of Terrace, and associates. There is a good pack-horse trail from the head of the lake to the workings.

The prevailing country-rock is a schistose slaty rock, striking N. 10° E. (mag.) and dipping easterly. The work has all been done on the *Bear* claim and consists of a number of open-cuts and trenches, exposing for a length of 700 to 800 feet a bedded quartz vein, up to 4 feet in width, mineralized with galena, zinc-blende, and pyrites. A shaft has been sunk 12 feet from the bottom of an open-cut, showing a face up and down on the vein of 20 feet, exposing about a foot of solid ore, mainly galena. Free gold can be panned all along the vein. A sample of a small seam of honeycombed quartz assayed 111.2 oz. gold to the ton. This little vein is very consistent through three groups of claims.

Mr. Hore, representing Seattle interests, has taken a lease and bond on this property in connection with the *Black Wolf* and *Golden Eagle* groups, which lie on either side of the *Bear* group. He intends putting a small mill on Falls creek as early as possible next spring (1922) as an experiment.

Lucy O'Neill. This claim is owned by George Little, of Terrace, and associates. It is situated about 8 miles up Maroon creek, which empties into the east side of Kitsumgallum lake about 3 miles from the head. The owners, with assistance from the Department of Mines, have built a good trail from the lake up Maroon creek to within a mile of the camp and have put a good cabin at an elevation of 2,225 feet, or about 1,800 feet above the lake. The trail could be improved into a pack-horse trail with very little additional expense, but to be of use as such the trail from the foot of the lake to Maroon creek would have to be repaired into a pack-horse trail as well. A pack-horse could then be taken through from Terrace to the head of Maroon creek, where there is a good-looking mineral area.

The work done on the claim consists of a shaft sunk 15 feet on a quartz vein lying in massive granite formation, probably a spur from the granite-mass which shows around the foot of the lake. The fissure-filling shows 18 inches of altered and slightly mineralized granite on the footwall; then 3 feet of heavily pyritized quartz carrying a fair percentage of chalcopyrite; then 2 feet of diorite dyke; and about a foot of mineralized quartz on the hanging-wall. The vein strikes N. 70° E. (mag.) and dips 60° to the north-west. No work has been done on the surface toward tracing or opening up the vein. The owners claim to have had assays up to $30 to the ton in gold, silver, and copper values. The ore would have a concentrating ratio of 6 or 8 into 1 and should make a good shipping product. The vein is well defined, well mineralized, and worth considerable exploratory-work.

Keystone.—This claim is owned by J. E. Garland, of Terrace, and adjoins the *Lucy O'Neill* claim on the west. The owner was starting an open-cut across the creek from the *Lucy O'Neill* shaft on the same vein.

Scenic.—This claim, also owned by J. E. Garland, is situated about 2 miles farther up the North fork of Maroon creek. I did not get up to this, but the owner informed me that he had discovered a 10-foot vein of quartz in diorite country-rock that resembles the vein and mineralization on the *Lucy O'Neill* and *Keystone* claims.

Fisher.—This claim has been held by Matt Allard for several years and this year he sold it to Mr. Hore of Seattle, who has working agreements on three other groups as well. The *Fisher* claim is situated about 5 miles from the lake, up the Little Beaver river, a tributary of the Kitsumgallum river. Mr. Hore took in a small mill of the Ross type, I believe, and got it on the ground, but did not get it installed. Work will be resumed in the spring.

The *Marten* group is owned by W. Treston and partner and is also on the Little Beaver river.

With assistance from the Department of Mines, a trail was cut from the lake to the canyon on the Little Beaver river, a distance of about 4 miles. This will enable prospectors to get to their claims in that vicinity, and should be continued up the Beaver river to open up that section, which is claimed to be a very likely one.

Silver Dollar Group. This group consists of two claims—the *Silver Dollar*, owned by Oscar Gendron and J. Couture, and *Silver Coin*, owned by J. Belway and the Estate of A. McLaren. The claims are situated on the Telegraph trail, about 3 miles west of Cedar River Crossing. This was formerly the *Iona* group of four claims, described by W. M. Brewer in the Minister of Mines' Report, 1914, page 109. Considerable work had been done by the former owner, mainly two long open-cuts along the vein and a crosscut tunnel about 40 feet long, driven to pick up the vein under the east open-cut. This shows the vein at that level to be from 12 to 15 feet wide, of a broken-up, brecciated quartz

and slate country-rock, very slightly mineralized with pyrites and an occasional speck of galena. The open-cut above the tunnel shows about the same.

Recent work has apparently been done on the west open-cut for this has opened up the vein along the foot-wall for a length of 30 feet. Two or three small lenses of high-grade ore, consisting of steel galena, some antimony, grey-copper, and a little zinc, carrying silver values up to 250 or 300 oz. to the ton, are exposed in this length. These lenses are too small and uncertain to be of much importance. There is about a ton of sorted ore on the dump.

Assessments were done on the *Blue Grouse* and *Hunter* groups, about 5 miles up the Cedar river from the crossing, by the owners, Oscar Olander and O. Wickstrom. Several individual claims were also represented. There is a good foot-trail from the crossing up the east side of Cedar river, built by Olander with aid from the Department of Mines.

Lakelse Valley (Thornhill Mountain) Section.

I did not get over this section this year owing to lack of time. However, it was reported on in 1918.

Lucky Seven Group.—This group of claims belongs to the Estate of Andrew Olson. They were bonded this spring to J. Ronan, who did considerable work on the small gold vein on the *Diamond* claim, where Olson and partner took out some small pockets of free gold. Development-work, however, did not justify taking over the property.

The *Iron Hat* claim was included in the above bond. The tunnel was driven ahead on the vein about 20 feet, which did not improve sufficiently to warrant further work.

Yearly assessments were done on the two principal groups on Thornhill mountain—the *Ptarmigan* group, owned by Michaud Bros., of Terrace, and *Society Girl* group, owned by Dan Mason and Walter Bell, of Terrace. The Department of Mines assisted the owners of claims on Thornhill mountain in repairing the trail this year.

NASS RIVER MINING DIVISION.

The mining centres of this Division are Anyox, where the Government Recording Office is located, and Alice Arm, which is the distributing-point for the Kitsault River valley and all its tributaries, the Illiance river, Alice arm proper, and its tributaries. They are served by the Grand Trunk Pacific and Union Steamship boats from Prince Rupert and Vancouver, each running once a week. A weekly mail-boat runs from Mill Bay, at the mouth of the Nass river, to Ayansh up the river. From Alice Arm the Dolly Varden Railway extends up the valley 18 miles to the *Dolly Varden* mine. From there is a good pack-trail to the Kitsault glacier, with branch trails extending up the main tributary streams.

There is also a first-class pack-trail up the Illiance river to its head, a distance of about 16 miles. From Ayansh there are trails up the river and throughout the valley, one across to the Illiance river and another south to the Kitsumgallum valley. The Division is therefore fairly accessible in all directions.

Very little prospecting has been done south of the Illiance river or north of the head of the Kitsault river, and as this portion of the Division is along the Eastern Contact Belt there should be good opportunities for the prospector.

This year the Division has had the most encouraging feature of the mining industry, in the continuous operation of the Granby plant, as well as one of the most discouraging, in the inactivity of the *Dolly Varden*.

Though there was more actual development being done in the Alice Arm district than elsewhere, the fact that the *Dolly Varden* was not shipping had a rather depressing effect on that community.

A good trail was built up the Illiance river and improvements made on the trail from the head of Hastings arm. A new wagon-road was constructed by the Provincial Government from the wharf-site to the town of Alice Arm, and the new wharf is now under construction by the Federal Government.

The Geological Survey of Canada carried out a survey of the upper Kitsault valley with a party under George Hanson, whose report and maps will likely be published early in the coming year. It is hoped that the services of Mr. Hanson can be obtained for next year for the extension of his work as a reconnaissance up the Illiance river, across to the Nass, and through to the Kitsumgallum Lake section, thus covering that portion of the Eastern Contact Belt mentioned above.

Granby C.M.S. & P. Co.*

The Granby Consolidated Mining, Smelting, and Power Company, Limited, has, fortunately, been able to operate its entire plant, with the exception of the "pilot" mill, continuously throughout the year, and from a quantity-production standpoint has had its most successful year since the smelter was "blown in" in March, 1914. During that time the company has produced from its *Hidden Creek* mines at Anyox approximately 200,000,000 lb. of copper. In order to maintain operations this year three separate wage reductions were made, on each of which a secret ballot was taken, resulting in a large majority in favour of continuance of work under a new lower wage scale rather than a probable shut-down with no work at all. The first of these reductions was at the first of the year, the second in April, and the last on September 1st, at which time a reduction of about one-third was made in the number of the mine crew and staff as well. Up to September the average number of men employed was 1,163; for the last four months, 926; or an average for the year of 1,084, against 1,277 for 1920.

Notwithstanding the reduction of labour, the tonnage mined was 896,802 tons, an increase of about 95,000 tons over last year, swelling the copper-output to 34,067,185 lb., an increase of nearly 9,000,000 lb., or about 35 per cent., over last year. The gold and silver yields were 7,652 oz. and 314,204 oz. respectively, each less per ton than last year, due to the fact that the quartz mined for flux from the *Rambler* carried no metal contents. Although there was a marked increase in the copper-output, the total value of the year's production will be considerably less than 1920 on account of the shrinkage in market prices of silver and copper.

No quartz was mined from the Granby Point quarries this year, but 22,500 tons was taken by the company from the *Rambler* claim just above the smelter.

The company's lime-rock quarries at Swamp point were not operated until April, the requirements for the first three months being drawn from storage. A total of 12,000 tons was mined during the balance of the year.

The greater portion of the 900,000 tons of ore mined and smelted was produced from the glory-hole and underground stopes above the 385-foot level, which is the main haulage level to the crushers, which are on the 230-foot level—No. 1 underground and No. 2 crusher on the surface, both discharging to storage-bins above the 150-foot level, the main haulage to the smelter. Also considerable heavy sulphide ore from No. 1 and No. 5 ore-bodies was hoisted from stopes above the 150-foot and below the 385-foot levels, the tonnage hoisted gradually increasing as the stopes became larger.

The large shrinkage stope in the No. 2 ore-body, which was started in 1916, was finished in the early part of September, making available such a large tonnage of ore that mining was discontinued in other parts of that ore-body. About 15,000 tons monthly was drawn from this stope during the last three months of the year. In the five or six years that this stope has been in operation there has been about 75,000 tons of what is considered high-grade ore broken, and it is worthy of note that during the mining of this large tonnage there was only one accident that resulted fatally and no others of any consequence.

In April contract stoping was started as an experiment in the No. 1 and No. 5 ore-bodies on the 150-foot level and has been continued throughout the remainder of the year, proving satisfactory in every way. There are two men in each contract, their pay depending on the footage they drill, the work being measured daily at the end of each night shift and the total footage drilled turned in to the office. The rates paid vary from 7 to 16 cents a foot of hole drilled, depending on the hardness of the ground, and the men never make less than day's pay and generally from $1 to $2 more. All machines, tools, etc., are supplied by the company.

Regular development continued uninterrupted up to September 1st, when owing to necessary curtailment all underground development ceased. The most of the development was done on the 150-foot and zero levels. The 150-foot level development was well along at the No. 1 and No. 5 ore-bodies, with only a few raises yet to be driven when work was stopped. The 10B crosscut has yet some 1,500 feet to go for the purpose of opening up No. 6 ore-body, and no crosscutting has been done in the direction of No. 2 ore-body. The zero level development consisted of crosscutting from the shaft, through the No. 1 ore-body, and into the foot-wall a distance of 400 feet.

Diamond-drilling continued throughout the year, encountering considerable extensions to ore-bodies, which materially increased the ore reserves. The diamond-drill was operated at the

* For general description of plant and mine *see* Minister of Mines' Report, 1917, and for coke and by-product plant, Report of 1919.

Bonanza mine for about three months during the summer, with very satisfactory results. This was the only work done in the *Bonanza* this year.

Many improvements in buildings and surface operations were made around the mine. The No. 1 and No. 2 bunk-houses were thoroughly renovated and added to. An assay office was started in June at the mine to handle the daily stope and drill-core work which had previously been done at the smelter assay office. A small dam was constructed on East Hidden creek to supply the increased demand for water for domestic and mine purposes. The No. 3 crusher unit, which was being built as an auxiliary to No. 1 and No. 2 crusher plants, was rushed to completion in January after the destruction by fire of the No. 2 unit on December 24th, 1920.

The most important new surface work was the reconstruction of the No. 2 crusher plant. The destroyed structure was built entirely of wood, reinforced with steel plate, and was always considered unsafe from fire. To prevent a recurrence of loss by fire, as well as to minimize repair and maintenance costs, the new plant was constructed of reinforced concrete. The structure consists of two cylindrical, reinforced concrete bins 24 feet in diameter, with walls 10 inches thick. Each bin is supported on twenty-four concrete pier foundations set on bed-rock and has a capacity of 750 tons of ore; these two bins are about 16 feet apart from wall to wall and between them is the crushing unit, enclosed by walls of metal lath and cement plaster. The building has three floors—feed, motor, and sampler—with oil, tool, and change rooms contained under one of the bins. The cost of the plant, including crusher, chute castings, electrical equipment, etc., complete, was about $50,000 and took about eight months to construct.

The coke and by-product plant was also in continuous operation throughout the year, producing 56,021 short tons of coke; 5,587 short tons of breeze or fine coke; 687,912 imperial gallons of tar; 9,189 imperial gallons of tar-paint; 2,162,155 lb. of ammonium sulphate; 213,485 imperial gallons of crude benzol; 188,738 imperial gallons of refined benzol; 61,000 lb. of naphthalene. The 100-ton "pilot" concentrator was not put into commission this year.

A great deal of scouting-work was done by the company this year and a great number of properties examined, but as yet no new work has been undertaken. With copper quoted at 13.55 cents for the average price for December, and the idle big producers anxiously waiting a little higher price to warrant a resumption of operations, it looks as if copper would remain about where it is for some time. It is understood that extensive work is contemplated by the company in the construction of a concrete dam that will provide ample power for all purposes the year round. H. S. Munroe is the general manager and J. A. Bancroft the assistant general manager at the plant at Anyox.

Golskeish Mines, Ltd.

This property, situated on Deep bay, about 3 miles from Anyox, has been producing and shipping to the Granby Company all year under the management of H. Heidman. The output of quartz, which is used for fluxing, was 9,203 tons, containing 943 oz. gold and 3,518 oz. silver. This is nearly three times the tonnage shipped last year and nearly double the amounts of gold and silver. Some barren quartz was shipped which reduced the average values, but the shipments made from the main pay-shoot averaged about the same as last year.

Hastings Arm Section.

Assessments were done for the year on the several properties situated up from the head of Hastings arm. A much-needed trail was repaired and cleaned out for about 8 miles by the claim-owners in that section, with assistance granted by the Department of Mines.

Alice Arm (Proper) Section.

Lime and Roundy Creeks.

The area at the heads of Lime and Roundy creeks is apparently a well-mineralized one and worthy of close prospecting. There is an old prospector's trail up Lime creek and a worse one up Roundy creek. The area warrants a good trail up the south side of Lime creek and some repairs on the Roundy Creek trail.

Lynx Group.

This is a restaking of the old *Cariboo* group. The old work consisted of a tunnel, now caved, about 50 feet long, driven across a hornblende dyke into a pegmatitic-looking formation in which occur small veinlets of molybdenum. Along the creek for 500 or 600 feet above the tunnel can be seen bands of quartz or quartz

porphyry up to several feet in thickness, alternating with wider belts of altered granite filled with quartz-seams, the whole carrying pyrites and molybdenum on the fracture faces.

Verona Group. This group consists of two claims—*Verona* and *Verona No. 1*—owned by Tom McCrostie, of Alice Arm. The claims are situated at the head of the South-west fork of Lime creek, at 3,250 feet elevation, and can be reached either by the trail up Lime creek or around by Roundy creek. The showing consists of a quartz vein from 6 to 24 inches wide, lying on the hanging-wall of a felsitic dyke about 6 feet wide which intrudes the slate or argillite country-rock. The vein strikes S. 10° W. (mag.) up the hill and dips 65° W., conforming with the strike and dip of the dyke, and from its evident connection with the dyke should be persistent. It has been uncovered about 400 feet farther up the hill. The quartz is heavily pyritized and there are also bands and bunches of mixed galena, pyrite, and zinc-blende. A sample of the mixed sulphides assayed 5 oz. silver to the ton and 9 per cent. lead. A sample of the galena assayed $2 a ton in gold, 33.7 oz. silver, and 23.5 per cent. lead. This is a rather promising little showing and warrants opening up.

Morley's Claims. These claims are situated on Roundy creek, 2,300 feet elevation, and about 1½ miles from tide-water in an air-line. The formation here seems to be a gneissoid granite that is either a shear-zone in the massive granite or the border of the granite near its contact with the argillite. Mr. Morley and two men were at work on the property and had done considerable open-cutting and stripping. A short tunnel also had been driven on a small quartz vein that was exposed in an open-cut above. The quartz vein lies in a siliceous belt about 50 feet wide, schistose along the sides near the massive granite, but more broken up in the centre, with small quartz veins running in all directions. The walls strike N. 45° W. (mag.) and stand almost vertically. One cut along the hanging-wall and above the present work shows a width of 6 feet or more of broken-up quartz and feldspar, with small veins of mineralized quartz and seams of solid galena, zinc-blende, and pyrites through it. A grab sample of the best-mineralized quartz-seams assayed $2 in gold and 142.5 oz. in silver to the ton.

This is an interesting-looking belt and with its width could easily develop a big tonnage of milling-grade ore. It is ideally situated for a tram-line to tide-water, straight down the gulch, which has evidently been formed by the erosion of the softer vein material.

Kitsault River Section.

The plight of the *Dolly Varden* mine has had a rather depressing effect on the town of Alice Arm from a business standpoint, and, of course, has not been much of a "boost" for the mining end of the section. However, the most serious phase of the situation is the question of transportation, due to the non-operation of the Dolly Varden Railway, and later made worse by the washing-out of a portion of the railway-grade and seriously damaging two or three of the bridges. It is vital to the mining development of the Kitsault valley, and consequently to the town of Alice Arm, that the railway be kept in repair, if only for the use of hand-cars for a time. This will practically eliminate any deleterious results from the inactivity of the *Dolly Varden* itself.

A great deal of prospecting and exploratory work has been done by the claim-owners throughout this section.

Independent Group.—This group, situated just above the town of Alice Arm, has had some further work done on the showings this year by the owner, Archie McPhail.

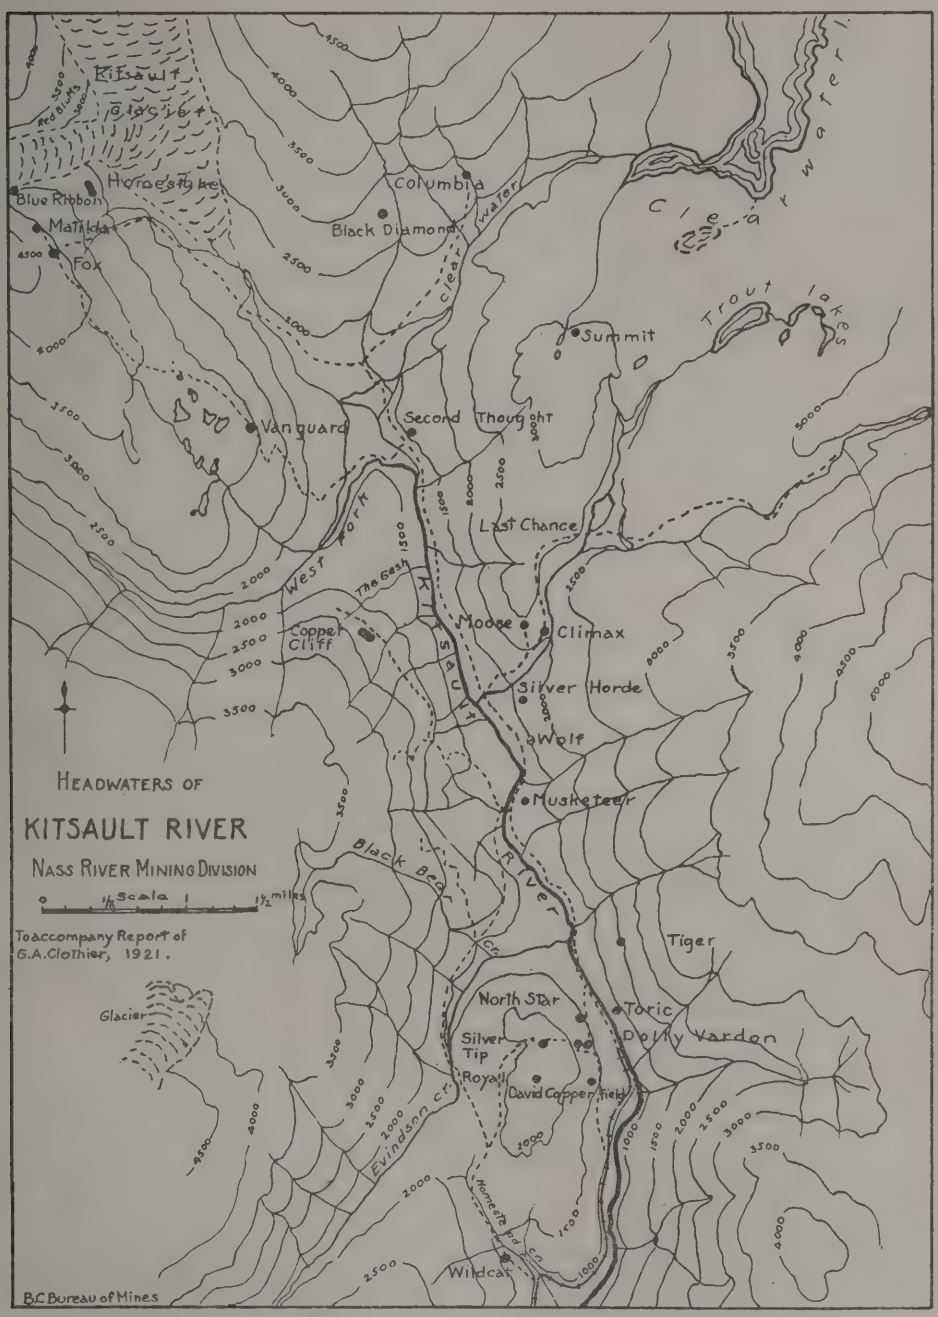
Black Bear or Esperanza Group. This group of three claims—*Black Bear*, *Aldebaran*, and *I Chance It*—was known in the early days as the *Roundy* property, having been staked and opened up by Frank Roundy, one of the first men in Alice Arm. Later it was acquired on a wage claim of a few hundred dollars by the Salinas Bros., who continued small shipments of high-grade silver ore each year. This spring the property was purchased by Mr. Elge, who has undertaken more extensive development-work, employing three or four men. He informed me that he was driving a crosscut tunnel about 150 feet long to get under some of the old upper workings, and at the same time drifting on a small high-grade vein that has just been opened up by Salinas. No shipments have been made yet, but he is confident that the ore taken from the drift will repay all expenditures. It is expected that shipments will be made some time during the winter.

Alice Arm La Rose Mining Co.—This company has not done anything this year on the *La Rose* group of claims on Paul Kladuc creek, which it acquired last year. (*See* Reports, 1919 and 1920.)

CORRIGENDUM.

Referring to page 51: The Consolidated Homestake Mining and Development Company wish to state that their company is not a reorganization of the Mineral Claims Development Company, and that their mineral holdings were not acquired from the Mineral Claims Development Company.

PROVINCIAL MINERALOGIST.



Wild Cat Group. (*See* Report, 1918.) There are four claims in this group—*Wild Cat*, *Montana*, *Slocan*, and *Medallion*—situated on the west side of the Kitsault river, above the Homestake Creek bridge. The owner, A. Davidson, of Alice Arm, has been extending the tunnel toward cutting a fair-looking vein of copper ore about 2 feet wide showing on the surface.

Dolly Varden and Wolf.

These mines were operated by the Taylor Engineering Company, Limited. There has been very little activity on the *Dolly Varden* and nothing whatever doing on the *Wolf*. During the summer about 1,874 tons of ore that had been broken down last year was shipped to the Granby smelter at Anyox, yielding 45,648 oz. of silver. In the latter part of September a small crew was put on at the *Dolly* for the purpose of developing a showing of shipping-grade ore that had been recently discovered on the surface. This work, however, apparently proved disappointing, for the crew was laid off and the mine closed down. A further discouragement occurred this fall when a portion of the railway-grade was washed out and two or three of the bridges damaged.

The property is equipped with a 500-horse-power plant at the *Wolf* mine; a complete mine equipment at the *Dolly Varden;* an 18-mile railway from tide-water to the *Dolly Varden* mine; plenty of rolling-stock for the railway; capacious ore-bunkers at the beach and a spur to them from the main line; wharf, offices, repair-shops, etc., at the lower terminal of the railway. A good tonnage of milling-ore blocked out and a concentrator would go well with the property now.

North Star.

The Alice Arm Silver Mining Company, Limited, owns this property, which lies just north of and adjoining the *Dolly Varden.* Very little work has been done on the property this year. Last winter some ore was sorted out, rawhided down to the railway, and shipped this spring to the Granby smelter. The shipment was 85 tons, giving returns of 1,870 oz. silver. James McAleenan, of Alice Arm, has charge of the company's affairs.

Vanguard Group.

Owned by Maurice Petersen and the Strombeck Bros. The camp and showings are reached by a trail branching from the main Kitsault River trail at the *Second Thought* cabin. The trail continues from the *Vanguard*, along the side-hill, to the *Matilda* tunnel, which lies above the *Homestake* group. The owners are working each year on this group, but in their absence I did not examine the property this year. The reader is referred to the Minister of Mines' Report for 1918, page 65.

The *Tip Top* and *Fox* claims were also described in 1918 Report.

Matilda.

This claim is owned by A. E. Smith, of Alice Arm. It is located above the *Homestake* group at an elevation of 4,100 feet. It has been made easily accessible by the extension of the *Vanguard* trail, which also serves the *Tip Top*, *Fox*, and other claims. This trail was built by A. Smith and O. Flint with aid from the Department of Mines.

Work on the *Matilda* claim consists of a tunnel at 4,100 feet elevation, driven about 30 feet in a siliceous, pyritized greenstone. The strike of this greenstone-belt is S. 70° W., while the tunnel was driven on a bearing of S. 30° W., or diagonally across it. The last work done was a crosscut from the face, at 45° to the right, which would make its bearing on the strike of the mineralized belt. The face of this crosscut is quartz and feldspar, disseminated with coarse-grained iron pyrites, an assay of which gave low values in gold and silver. It is, however, a big strong showing and should be drifted on.

Blue Ribbon Group.

This group, consisting of the *Silver Tip*, *Silver Tip Fraction*, *Blue Ribbon*, and *Mountain Goat* claims, is owned by J. Fiva and H. Ness, of Alice Arm, who have done a very creditable amount of prospecting not only on these claims, but in the vicinity. The group lies above or west of the *Homestake*, north of and adjoining the *Matilda*, and south of the West arm of the Kitsault glacier. There is no timber on the claims and the camp cabin is therefore located on the north side of the arm of the glacier.

The prevailing country-rock of this group—in fact, of the mountain—is greenstone or green andesite. At an elevation of 3,600 feet, and about 100 feet above the glacier, the owners were driving an open-cut to hit a quartz vein seen cropping on the surface. The cut was in about 25 feet and still in a soft material, which obscured the vein, along the abrupt face of the mountain. The vein cropping above this shows a width of about 12 feet of quartz mineralized with pyrites, zinc-blende, and galena, parallelling the *Homestake* vein below it. On the surface the vein carries small values in silver and a trace of gold.

On the *Blue Ribbon* claim of the group, at an elevation of 4,575 feet and near the head of the West arm of the glacier, there is a belt of argillite about 100 feet wide cropping through the andesite on the north side of the mountain. Higher up the andesite can be seen overlying the argillite, which again crops on the south side of the hill. This belt has been badly crushed

and broken up and the fracture-cracks filled with calcite mineralized with chalcopyrite, with a little galena showing as well. Free gold can frequently be detected in the calcite and the fine, black, decomposed material pans gold freely. Samples of the pure chalcopyrite assay 34 per cent. copper and $2 in gold to the ton. A sample of several pieces of the calcite, showing a little chalcopyrite, assayed a trace of gold, trace of silver, and 1.8 per cent copper. It is very doubtful if the calcite stringers are numerous enough or carry sufficient values to make the whole a commercial ore. Some work would have to be done to get below surface conditions in order to obtain average values. There is a foot-trail leading up from the lower claims of this group and also a trail from the *Matilda* tunnel.

Homestake Group.

(*See* 1918 Report, page 64.) The Consolidated Homestake Mining and Development Company, Limited, whose head office is in the Credit Foncier Building, Vancouver, is a reorganization of the Mineral Claims Development Company, which was incorporated three years ago and acquired the *Homestake* group from the original owners, A. Davidson, Gus Pearson, and A. Smith, of Alice Arm. The holdings consist of the four claims—*Homestake No. 1*, *Homestake No. 2*, *Homestake No. 3*, and *Homestake No. 4*—situated 26 miles up the Kitsault river from tide-water, on the west bank of the lower end of the Kitsault glacier. It is about 8 miles from the upper terminus of the Dolly Varden Railway over the main Kitsault trail, which has been put in fairly good repair and fit for pack-horses. Though the property was taken over three years ago, this is the first year that any development-work of importance has been done.

The prevailing rock formation of Homestake mountain appears to be a green andesite. A number of open-cuts have exposed a mineralized zone or vein of siliceous rock up to 35 or 40 feet in width, carrying pyrite, chalcopyrite, and galena. The vein strikes about east-west (mag.) along the side-hill. On the lower side of the main vein one very promising cross-vein has been opened up by open-cuts, and other smaller veins were noted, all having a general strike of S. 70° W. up the hill, and therefore intersecting the main vein at an angle of about 20°. The same feature is shown above the main vein in the veins of the *Matilda*, *Tip Top*, *Fox*, and others, all striking about S. 70° W. into the hill. These cross-veins will no doubt have an important bearing on the mineralization of the main zone, in which enrichments may be expected at the points of intersection.

This year development of the property was undertaken, with Captain Gerhardi in charge and Major Creighton as foreman, with a crew of about twelve men. Tent camps were put up at 3,100 feet elevation by excavating along the steep side-hill. The main Kitsault River trail was put in shape from the Kitsault bridge to the camp, a distance of about 2 miles. Mining-work was started about August 1st and vigorously maintained until about October 15th. In that time No. 1 tunnel at 3,350 feet elevation was driven 123 feet, No. 2 tunnel driven 47 feet, and No. 3 tunnel faced up on the surface; in all, a very creditable amount of work. At the time of my examination No. 1 tunnel had been driven 107 feet, the last 4 feet showing mixed sulphides, pyrite, a little chalcopyrite, galena, and zinc-blende. Later information from Mr. Gerhardi is that, at 115 feet in, a 7-foot vein was cut through, averaging $45 in gold and 2.14 oz. in silver to the ton and 0.75 per cent. copper. It is expected that this tunnel will encounter the main vein in about 40 feet.

No. 2 tunnel is planned as the main working-level and will have to be driven about 600 feet to cut the main vein. It is further planned to install a compressor in the spring, driven by water-power developed from Helme creek; extend No. 1 tunnel to the main vein, on which a depth of 150 feet will be obtained, and do some exploratory work on it; and drive No. 2 tunnel. The property is certainly looking encouraging and, I believe, has a good chance of developing into a valuable producer.

Second Thought Group.

(*See* 1918 Report, page 63.) Some work was done this spring in open-cutting on the upper (or east) vein. This work shows a strong vein of brecciated quartz and slate, apparently on the contact of the slate and andesite, since the upper cut shows andesite on the foot-wall. There is no mineral of any account showing in these cuts. This vein strikes N. 72° W. (mag.) and dips 38° W., about conforming with the slope of the hill, and cannot be over 75 feet east of the lower vein. The lower vein about parallels this but dips at 65° W.; the veins would therefore come together at very little depth. Since I was on the property this summer, Jack Graham, one of the owners, has extended the crosscut tunnel on the lower vein a further 25 feet through banded quartz and

slate to an andesite formation in the face. No values of any account were found. The andesite here may be only a spur from the main mass, or it may be that the two veins have merged and the andesite is the foot-wall, as shown in the higher cuts. I would advise some drifting from the tunnel, where the best values were found.

Columbia Group. This group of five claims, owned by Pete Anderson and Fred Brown, is situated on the north side of Clearwater creek, about 2 miles from the *Second Thought* cabin. Pete has built a fair trail, branching from the main Kitsault trail above Clearwater creek, to his cabin, which is at 2,600 feet elevation. He has driven a tunnel 83 feet, following a brecciated vein of quartz and slate in a slate country-rock. No values were obtained on the surface on this vein and at only one point in the tunnel were any values found—$5.60 to the ton in gold. The owner insists on driving the tunnel, so I advised him to stay on the foot-wall of the vein and "go to it."

Summit Group. There are two claims in this group, owned by A. Davidson, D. W. Cameron, and O. Evindsen, of Alice Arm. The claims are situated on the divide between Clearwater and Trout creeks, at an elevation, where the work was done, of about 3,100 feet. An open-cut or trench was run for a length of 75 feet, following a shear-zone in greenstone porphyry, and exposing parallel seams of quartz across a width of from 10 to 12 feet, sparingly mineralized with galena. A tunnel 150 feet long was driven under this surface showing, but disclosed nothing except a few stringers of barren quartz cutting across the tunnel.

Last Chance Group. (*See* 1918 Report, page 62.) The owners of this group, Archie McPhail and Pat Morley, have done a lot of work on the showings since the property was diamond-drilled two years ago. A great deal of stripping and open-cutting has traced the vein for over 1,000 feet and some fine ore has been found. The owners have decided to run a crosscut tunnel from the foot of the hill to the vein, a distance of 200 feet, which will give about 140 feet depth on it. About 55 feet of this work was done this fall and will be resumed in the spring. Judging from surface indications, I think there is a good chance of opening up a big body of at least milling-grade ore, with probabilities of finding lenses of high-grade ore in the vein.

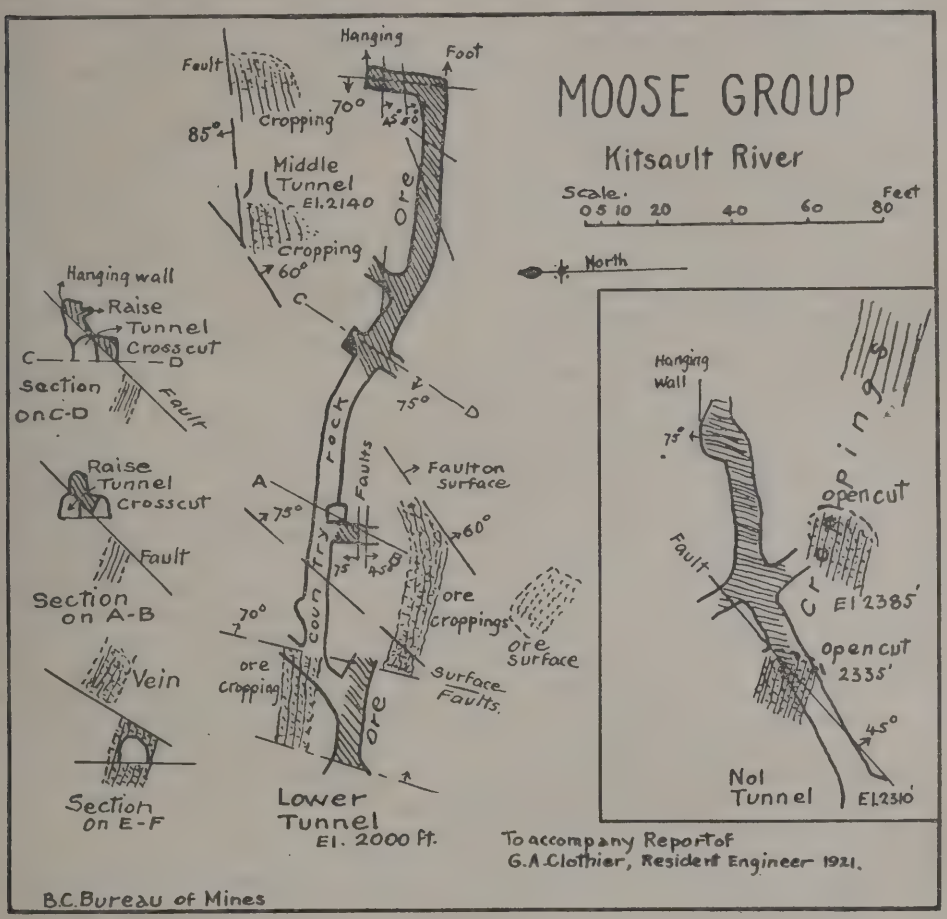
Moose Group. This consists of five claims—*Moose No. 1*, *Moose No. 2*, *Moose No. 3* *Moose No. 6*, and *Moose Fraction*—staked by Don Cameron, and owned by him and associates, of Alice Arm. The claims are situated on the north side of Trout creek, about 3½ miles from the Dolly Varden Railway. Last fall, 1920, a syndicate was formed in Vancouver, called the Moose Group Mining Company, Limited, and a lease and bond taken on the property. Camps were put up and a crew of men kept at work all winter. Before the snow came extensive surface prospecting was done by open-cutting, the winter work consisting of driving two tunnels, called the upper (or No. 1) and the lower (or No. 3).

The No. 1 tunnel, at 2,300 feet elevation (*see* sketch), had been driven about 35 feet by the owners for the purpose of getting under a good-looking surface showing that had been exposed in an open-cut. At the face the vein was shown to be about 12 feet wide, 6 feet of which would average 30 oz. silver to the ton. The company extended this tunnel 60 feet in ore of good milling grade all the way, selected samples assaying up to 600 oz. silver to the ton, and altogether giving very encouraging and satisfactory results. The No. 2 (or middle) tunnel, the position of which is shown on the accompanying sketch of the No. 3 tunnel, has been driven on the vein, but only a small amount of work has been done here.

The No. 3 (or lower) tunnel at an elevation of 2,000 feet, was started by the company and driven about 130 feet. The first 15 feet from the portal is on the vein, to a cross-slip which was followed to the left about 25 feet. Finding nothing along the slip, the tunnel was turned to the right and driven about 90 feet in country-rock on the bearing of the vein, about east, as shown in the first 15 feet of the tunnel. This work proved disappointing and work was therefore discontinued and the bond relinquished early this year.

The owners were, of course, disappointed in the results of the work and not altogether satisfied, so decided to "take another stack" in the game themselves. Their first work on the property this summer was to drive ahead through the slip, showing about 15 feet in from the mouth of the tunnel, and pick up the vein at that point. They then turned to the right from the face of the tunnel inside, found the vein in-place, and drifted 75 feet along the foot-wall. Crosscuts were driven to the hanging-wall, showing the vein to be from 10 to 22 feet wide. The

general tenure of the ore is low grade, with a little improvement on the hanging-wall side. Good ore was found on both sides of the slip followed in the crosscut at the face; in fact, the higher grade is always found at or near the cross-slips.



The details of the accompanying sketches, croppings, faults, slips, cross-sections, etc., were taken from a very interesting assay map worked out by D. W. Cameron, one of the owners. It is their intention to carry on development-work if the Dolly Varden Railway is put in repair, and so enable them to ship ore that can be sorted out as they go ahead.

Toric Group. There are four claims in this group—*Toric*, *Anglo*, *Moose*, and *Lamb*—situated on the east side of the Kitsault river, a little north of and opposite the *Dolly Varden*. They extend from the river up the hill along the strike of the vein, which could be the extension of the *Dolly Varden* vein. The property is owned by the Strombeck Bros., of Alice Arm, and Al. Miner, who have done a very creditable amount of work in prospecting for and opening up the vein. The main vein, which strikes about N. 80° E. (mag.) and dips 65° N., has been exposed by a crosscut tunnel located about 150 feet above the railway-grade; several open-cuts above the tunnel tracing the vein for 500 feet or 600 feet up the hill; and several open-cuts and trenches on the upper claims. The tunnel shows a cross-section of the vein, of 5 feet of well-mineralized banded quartz and a reddish rock resembling jasper, on the foot-wall; then 8 feet of andesite country-rock; then 4 feet of vein without reaching the hanging-wall.

In one of the open-cuts about 500 feet above the tunnel some ore showing native silver was struck last fall. This year this was further explored and about a foot of high-grade ore exposed

on the foot-wall of the vein, which has here been crosscut for about 4 feet. This part of the vein is a breccia, consisting of a milky-looking quartz, fragments of andesite, and glassy quartz and jasper. The whole is mineralized with pyrite, argentite, and native silver, the latter occurring not only on the seams, but distributed in thin flakes and seams through the quartz. A crosscut was started about 30 feet below this open-cut to obtain further depth on the native silver showing.

I did not get to the upper showings, but John Strombeck informed me that in running an open-cut he crossed a 5-foot vein, an average sample of which assayed over 100 oz. to the ton in silver. With the vein traced for 600 or 700 feet on the lower end, and what is presumably the same vein exposed on the upper claims, and ore of good grade showing in several places, the property is looking very promising.

Ruby Group. This group, consisting of two claims—*Ruby* and *North Star Fraction*—lying south of the *Toric* group and east of the *Dolly Varden*, on the east side of the Kitsault, has been under option to J. C. Smith, of Seattle. No work has been done on the property this year, but in the two previous years about 100 feet of tunnel was driven. The surface showing consists of a broken-up andesitic dyke in which are veinlets of quartz showing little or no mineralization. To explore this an open-cut 12 feet long was made and continued in a tunnel 60 feet long, from which two or three crosscuts, the longest about 45 feet, were run to explore the ground at a depth of about 40 feet. There is nothing in the shape of mineralization showing in any of the underground work.

Silver King and Eagle. These claims are owned by Louis Forsberg, of Alice Arm, and are situated about half a mile south of the *Central* group and about 1½ miles from the Kitsault, at an elevation of 1,400 feet. The river is crossed on the cable at McFarlane's cabin and the trail followed down the east side of the river about a mile before climbing the hill. The trail should be cut from the river-trail up to the showings. The showings are quartz veins up to 3 feet in width, occurring in a shear-zone about 50 feet wide in andesite formation. The general strike of the zone is N. 15° W. (mag.) and the quartz veins, so far as shown, parallel the walls. The quartz is mineralized with pyrite and some galena and zinc-blende and carries $8 to $10 values to the ton in gold and silver, mainly the latter. Considerable open-cutting and stripping has been done across the zone, for the work of one man. On the hanging-wall there is a fairly well-defined vein exposed up to 3 feet in width, dipping about 70° E. On the foot-wall side of the zone an excavation about 4 feet deep shows a face of andesite in which are stringers of slightly mineralized quartz. I advised driving into the hill on the hanging-wall vein, gaining good depth, to ascertain if there was any improvement in values, which is frequently found with depth in this section. A crosscut could then be driven from this tunnel cutting the balance of the zone.

War Dance Group.—This group, situated up the East fork of the Kitsault, consists of six claims, owned by A. McGuire, of Alice Arm. He has done considerable work this year on this group and other individual claims. I understand that this and two other groups have been bonded.

Illiance River Section.

There has been considerable exploratory work done in this section this year, but unfortunately, the results have not been as favourable as expected from surface indications. However, the amount of work done has not been sufficient to gain any conclusive information.

Much-needed work in reconstruction and repairs was done on the trail, with appropriations from the Department of Mines. I understand that the trail is now in good condition for pack-horses all the way from the beach to the divide.

McGrath Mountain.—Assessment requirements have been kept up on all the claims in this vicinity, including the *Silver Bell*, *Lone Star*, *Silver Band*, *Standard*, and *Dixie* Groups.

Copper Creek Group. This group consists of five claims—*Black Diamond No. 1*, *Black Diamond No. 2*, *War Eagle*, *Little Giant*, and *Liberty*—and is owned by G. W. Morley and partner, of Alice Arm. The claims are located about a mile below Copper creek, or about 5 miles up from the beach along the Illiance trail. The owners have done a lot of work this summer in open-cutting along the hillside on the vein. This work shows the wall-rock to be diorite. The mineralization has been exposed across a width of 50 feet and consists of bands of black, cherty-looking quartz and a fine felsitic rock. The quartz-

bands are up to 5 feet in width and contain small stringers of steel galena and pyrite. A grab sample from the dump, not intended for an average but for the purpose of obtaining relative values, gave a trace of gold, 1.2 oz. silver, and 6.5 per cent. lead. The owners state that they have found high silver values in different places.

Bellevue Group.

(*See* 1920 Report, page 51.) The Alice Arm Holdings Company, Limited, whose head office is at 614 Pender Street West, Vancouver, is incorporated with a capitalization of $1,000,000, in shares of $1 each. The *Bellevue* group, under bond to and operated by this company, consists of the five claims—*Bellevue No. 1*, *Bellevue No. 2*, *Bellevue Fraction*, *Snow Fraction*, and *Blenheim*—situated about 13 miles up the Illiance river from Alice Arm.

The rock formation in this portion of the Illiance valley is an altered porphyritic andesite, more or less schistose and slightly pyritized throughout. In this formation are belts or zones of soft schists, probably caused by intense shearing action, which have been replaced in part by lenses, stringers, and parallel bands of quartz mineralized with iron pyrites, zinc-blende, galena, and grey-copper, all carrying gold and silver values. There are apparently several of these mineralized zones, the most important so far being the one cropping at the south end of the *Blenheim* claim. Surface sampling of this by an examining engineer gave an average of 23 oz. silver to the ton across 15 feet. This surface showing is an exceptionally favourable-looking one.

This year's work, carried on through all last winter and up to late in the fall, consisted in driving a crosscut tunnel under the big outcropping, and two drifts from it, each about 30 feet long, on small lenses of ore crossed in the tunnel. In addition to the underground work, considerable surface work was done on another vein east of the one above the tunnel and seen cropping along the bank of the river. This work consists of a number of open-cuts and a small crosscut tunnel, all cutting the vein and showing it to be 3 or 4 feet wide, containing stringers up to 6 inches thick of fine-grain galena. As this vein is only a few feet above the creek and paralleling it, no depth of any account can be gained by crosscutting from the bank or by drifting on the vein. It is, however, well worth while sinking on anywhere between or at the two lower cuts, where the mineralization is the strongest. This vein lies along or very close to a strong diorite dyke which extends up and down the creek a long distance, and which probably has something to do with the mineralization found so close to it.

The tunnel and drifts driven last winter is a good piece of work and worthy of better results. It proved very disappointing in failing to find the extension downward of the big ore-showing on the surface. The tunnel was driven 280 feet, obtaining a depth of about 100 feet vertically beneath the vein-cropping and about 140 feet at the face. It crossed a considerable width in which occur small lenses and stringers of ore, which, however, are not big enough or continuous enough to make the ore of commercial value. Two short drifts were run on the best of these small showings, but did not amount to anything. I would advise the company that further exploratory work be done underground by driving the crosscut tunnel ahead until it is certain that the vein showing on the surface has been crossed, or until the cross-slip which shows on the trail going down to the tunnel is encountered. This cross-slip, running to the dyke, is also mineralized, and it is very possible that where it intersects the main vein, which parallels the dyke, is the point where there is a concentration of mineralization. It may possibly displace the main vein, and therefore further work is necessary to obtain more conclusive information.

All the work has been well placed and well done. Mr. Hughes, who has had charge of the work, is deserving of credit for the amount and quality of work he has accomplished with the number of men he has had employed and the difficult trail conditions with which he has had to contend. Altogether, the affairs of the company appear to have been well handled in a businesslike and efficient manner.

Silver Bell Group.

This group, owned by Joe Hayes and associates, has had assessment-work done this year. The reader is referred to the Minister of Mines' Report of 1918, page 71, for a full description of the property at that time. Subsequent work has opened up some of the surface showings to a little depth, and I think the property would pay to operate in a small way by sorting and shipping the high-grade ore.

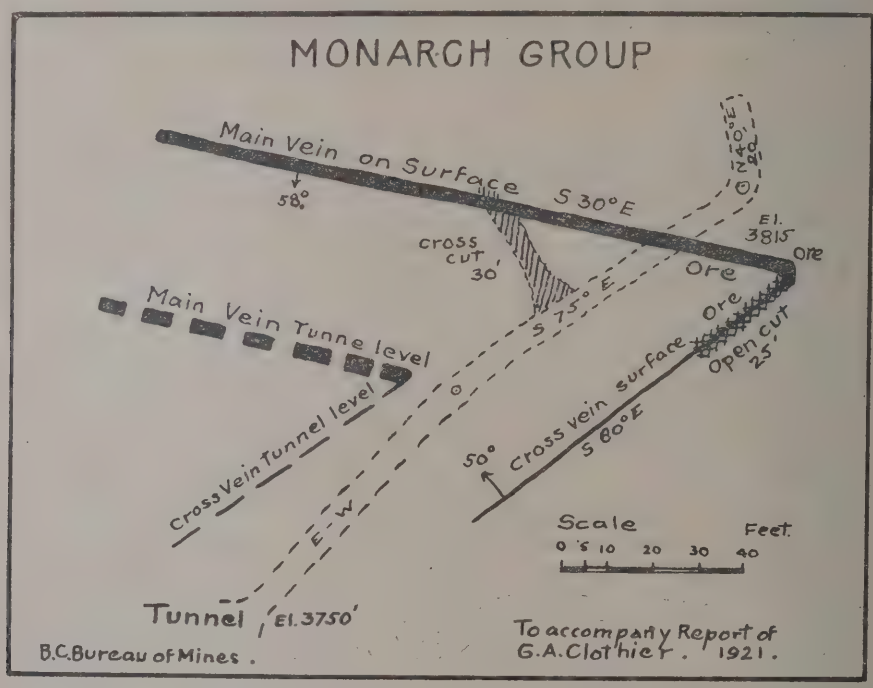
United Metals Mining Co., Ltd.—Nothing has been done on the property for the past two years.

Silver Star Group.

This group was further developed this year by the owners, A. R. Hodgson and associates. Last year a crosscut tunnel cutting the vein and a drift on the vein made a very encouraging showing. This year's work, however, consisting of more drifting and crosscutting, proved very discouraging, in that it was demonstrated that the small parallel veins or lenses of ore gradually diminished and disappeared in the soft gangue. Work was discontinued early in the summer.

Monarch Group.

There are two claims in the group—*Monarch* and *Monarch No. 2*—owned by W. B. Bower and associates. The claims are situated just to the right of Summit lake, the source of the Illiance river, on the divide between Alice arm and the Nass River valley and about 16 miles from tide-water at the head of Alice arm. A few years ago a crosscut tunnel (*see* sketch) was driven 144 feet for the purpose of locating the downward extension of a well-defined, well-mineralized vein that had been open-cut and stripped, exposing some very fine ore on the surface. The tunnel, however, failed to pick up the vein at depth and nothing further had been done on the property until



this year, when Bone & Hodgson procured an option on it. They first put in an open-cut on the cross-vein up to, but not through, the main vein. The face of this open-cut is 6 feet wide and 12 feet high and has a very fine showing of ore. A crosscut was then driven from a point about 90 feet in the tunnel to the left to cut this ore-shoot, but nothing was found. The crosscut is shown in the accompanying sketch, and I think it is too far in the tunnel and consequently under the foot-walls of both veins. I believe that a crosscut to the left, about 40 or 45 feet in the tunnel, or a short raise at 60 feet in from the mouth of the tunnel, would quickly prove whether the vein exists at that depth or not.

Glacier View.—This claim is situated about a mile beyond the *Monarch*, on the Nass slope, and is said to have a very promising showing. I have not seen the property.

Old Woman Group.

This group consists of four claims—*Old Woman No. 1*, *Old Woman No. 2*, *Old Woman No. 3*, and *Old Woman No. 4*—and is situated on the trail to Bowman lake, just over the divide on the Nass slope. They are owned by Henry Carney, of Alice Arm, and partners, who claim a big showing of considerable merit. I tried to find the showings from instructions, but lacking even a blazed trail from the main trail, I was unsuccessful.

A good route for a prospector's trail from Alice Arm to the Nass river would be to follow the old Bowman trail from the 11-Mile bridge on the Illiance to Bowman lake, and from there down to a branch of the Tchitin river and that followed through to the Nass valley. From Bowman lake to the Nass would be, I should judge, about 12 or 14 miles.

PORTLAND CANAL MINING DIVISION.

This Division takes in all the country on the east side of Portland canal (the west side is Alaska) to the summit of the range, and all the upper basin of the Nass river from the White river, one of its tributaries, north. This latter portion of the Division, though over the Bear River divide, is included in it because it is at present more accessible by way of Stewart. Eventually there will probably be a good pack-trail or wagon-road built on an easy grade up the Nass river from Ayansh, the head of navigation, through to Meziadin lake and beyond. There is an old Indian trail through there now, but it is seldom used.

The town of Stewart, at the head of Portland canal, is the distributing centre for the Division and has the Government Recording Office. It is the most northerly seaport in the Province and is reached by Grand Trunk Pacific Railway boats from Prince Rupert, which make weekly trips in summer and fortnightly in winter, a gas-boat running from Rupert in the alternate weeks, carrying freight and passengers.

From Stewart to the heads of Salmon river and Cascade creek by way of Hyder and up the Salmon River valley is about 26 miles. Hyder is about 2 miles from Stewart, on tide-water at the mouth of Salmon river, and on the Alaskan side of the boundary. There is a first-class wagon-road between the two towns, built by the Provincial Government, to connect Stewart with the road up Salmon river. At present there is a good winter road to the *Premier* mine, about 17 miles from Stewart, which will be completed into a first-class wagon-road next year by the Alaska Road Commission to the boundary-line at 13-Mile. This road is being continued by the British Columbia Government from the *Premier* road a further distance of 7 or 8 miles up the valley. The upper part of the valley is now served by a pack-trail branching from the wagon-road at 13-Mile up the west side of Cascade creek to the *Forty-nine* mine, branching off to several other properties. There is also a trail from the wagon-road below the *Premier* following up the East fork of Cascade creek to the *Spider* mine. Prospectors working over the Salmon River divide, on the Nass slope, can have supplies packed to the *Forty-nine* or *Spider*, from either of which points it is about 8 miles over the divide to the foot of the glacier on the Nass side. It is good travelling over either glacier. That the Nass slope is a good prospecting country is evidenced by the samples of high-grade silver ore that have been brought in from that area.

From Stewart up the Bear River valley to the Bear River divide is 26 miles, of which the first 14 miles is over a fair wagon-road, from which there is a good pack-trail to the divide and on through to Meziadin lake and the Groundhog coalfields. The necessity of starting a trail branching from this on the east side of the divide and following north along the eastern slope of the Coast range for prospecting and exploratory work has been referred to elsewhere in this report.

There has been nothing doing on the Unuk River area this year. A trail from tide-water up the river to the mineralized area above the boundary-line is essential to the opening-up of this section, which is another small area of the Eastern Contact Belt lying on the Pacific slope, similar to the Salmon and Bear Rivers sections.

The Portland Canal Mining Division has probably felt the general mining depression the least of any part of the district, on account of the intense activity of the Premier Gold Mining Company, which has employed several hundred extra men throughout the year in tramway and other construction-work. Otherwise mining has been very quiet, except that there has been more than the ordinary amount of work done by individuals on their claims. The only other company operating in the Division is the Silverado Mining Company at Stewart. The prospector seems to have been exceptionally busy, for many samples of fine ore have been brought in from all directions. The prospector is at last getting down to business. It looks as if there might be a number of small shippers of high-grade ore developed in the coming year.

I am informed that the new Government dock at Stewart is to be enlarged as soon as the work can be gotten under way. It can be realized that the present docking and freight-handling

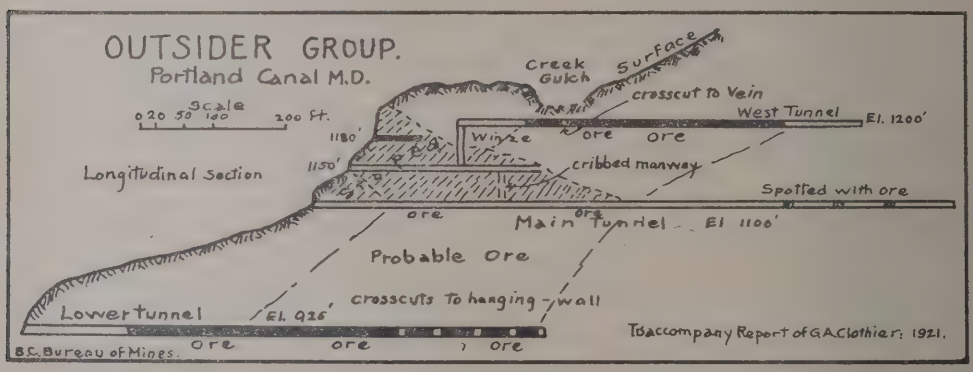
facilities are totally inadequate, when the Premier Company alone handled over 6,000 tons of incoming freight and shipped out about the same tonnage of ore.

The Summary Report, 1920, Part A, issued by the Geological Survey of Canada, contains the Preliminary Report of S. J. Schofield on the Salmon River area, giving valuable information regarding the geology and ore occurrences of that section. The geological map has been issued since the report and both may be obtained from the Mines Department, Ottawa. The detailed report should be out early in the year.

PORTLAND CANAL (PROPER) SECTION.

Outsider Group.

This area consists of the country bordering Portland canal on the east, from the mouth of the canal to its head at Stewart, and need not be confused with the Portland Canal Division. (See 1918 Report, page 73.) This group consists of eight claims—*Elsie*, *Tunnel Frac.*, *Copper King*, *Regina*, *Hope*, *Brown*, *Summit*, and *Constance Frac.*—situated at Maple bay, about 35 miles down the canal from Stewart. The property was operated in 1905 and 1906, known then as the *Brown-Alaska*, shipping several thousand tons of 2.8-per-cent. copper ore to the Hadley smelter on Kasaan peninsula, Prince of Wales island. It is now owned by Martin Woldson and associates, of Spokane, Wash. They have done a considerable amount of work, driving the lower tunnel along the foot-wall of the vein for about 700 feet and running six crosscuts to the hanging-wall. (*See* sketch accompanying this report.) This tunnel is 175 feet vertically lower than the main tunnel from which the ore



was shipped, and in it the vein is shown to be from 8 to 16 feet wide, fairly well mineralized with pyrrhotite and chalcopyrite. The central portion of the vein is sparingly mineralized, while the walls, and especially the foot-wall, show a better grade of ore. There is probably 3 feet on the walls that will assay from 3 to 5 per cent. copper, but the whole vein would average probably less than 2 per cent. There is a small gold and silver content, a 5-per-cent. copper ore carrying from 60 cents to $1 in gold and silver values. The last 400 feet to the face shows a strong, well-defined vein in which will be found lenses of good ore along the foot-wall.

As shown in the sketch, nearly all the ore has been stoped out above the main tunnel to the surface. There is some ore left on either end of the stope; the outside end near the portal would yield a small tonnage through to the surface. The inside end shows 3 feet in width on the foot-wall, assaying 5 per cent. copper and 1.2 oz. silver to the ton, and might produce considerable tonnage, though the back of the stope for the last 50 feet shows the vein to have pinched down to about a foot of ore, of very good grade, however. A raise from the inside end of the stope on this level or a winze sunk on the ore showing in the west tunnel would give good information. Beyond the stope the vein seems to break up and only an occasional patch of ore can be seen.

The west tunnel has been opened up by a crosscut from the surface to the vein, a distance of 150 feet. The vein was then drifted on, 150 feet south and 400 feet north, exposing an ore-shoot 350 feet in length. The ore taken out in development was evidently shipped, as there are remnants of a tramway from the mouth of the tunnel around the hill to the old workings, from which the ore was lowered to the bunker, at the head of the aerial tramway, to the beach.

At an elevation of 2,100 feet, 900 feet above the west tunnel, there is a big outcropping of the same class of ore. It has been stripped for a length of 300 feet and shows an average width of about 10 feet. The surface is a decomposed, honeycombed quartz which, broken into, shows the same mineral content as the vein below. This is supposed to be another vein east of the one developed below.

Maple Bay Groups.

These groups, consisting of some twenty-two claims and fractions, situated at Maple bay, adjoining the *Outsider* group on the south, are owned by the original stakers, W. Noble, of Stewart, and associates. They are some of the oldest stakings in the Portland Canal Mining Division. The property was under option to the Granby Company three or four years ago, who put in a wharf, installed a compressor at the beach, put up about a mile of tramway from the beach to the tunnel, and drove a tunnel on the *Star* claim nearly 700 feet long. It is at an elevation of 375 feet; a tunnel was driven on the lower extension of the *Outsider* vein to within a short distance of the *Regina* end line, one of the *Outsider* group of claims.

The first ore-shoot is about 200 feet long from the mouth of the tunnel, but, as very little depth was obtained, the tonnage available to the surface was small. Some ore was extracted farther along on the vein, but work was finally discontinued and the plant, including the dock and tramway, was dismantled. No work was done on any of the showings on the upper claims of the group.

The trail to the higher showings branches from the wagon-road a little way above the point where the road crosses the *Star* tramway. The road starts from the beach, just south of the *Outsider* ore-bunker. The trail strikes across the flat to the creek, which it follows a short distance, then turns to the left and zigzags up the side-hill. It is badly overgrown across the flat, but is in good repair up the hill to the old camp on the claims at an elevation of 1,700 feet. From the cabin there is a trail along the side-hill, crossing the creek just below the canyon, to the showing on the *Thistle* and *Rose* claims, at 2,100 feet elevation. This vein, striking N. 10° W. (mag.) and dipping slightly to the west, has been exposed along the hill by stripping at intervals for a distance of several hundred feet. It is quartz up to 20 feet in width, lying in a greenstone formation, and sparingly mineralized throughout with pyrrhotite and chalcopyrite, with apparently a foot or two of better-grade ore on the hanging-wall. One exposure shows a lens of ore about 100 feet long and 10 feet in the widest place that I should judge would assay from 4 to 5 per cent. copper. A crosscut tunnel was driven, at 2,000 feet elevation, 175 feet through the greenstone country-rock to cut the vein, but the only showing in it is a 3-foot vein of barren quartz in the face and a few quartz stringers cutting across the tunnel. I think the tunnel should be extended a little to be sure that the vein exposed on the surface has been cut.

Above this vein another parallel quartz vein has been exposed on the *Anaconda* mineral claim. It has been stripped in five or six places and consists of a siliceous rock in which are lenses of mineralized quartz and small lenses and bunches of iron and copper sulphides. Considerable honeycombed quartz shows, probably an indication of sulphides below the surface. It is not so promising-looking as the *Thistle-Rose* vein.

To the east of this about 150 feet, and also on the *Anaconda* claim, another parallel vein has been traced for 300 or 400 feet by several open-cuts. It is shown to have a width of about 8 feet of fairly well-mineralized quartz. Its strike would indicate that it joins the big vein found on the *Princess May* claim farther up the hill.

Continuing up the hill to the croppings along the north side of the canyon on the *Princess May* claim, there is exposed a vein of quartz, 25 feet or more wide, which has been traced with open-cuts for about 1,000 feet up the hill. The lower cropping is at 2,900 feet elevation and the highest at 3,400 feet. The vein varies in width from 8 to 25 feet and has about the same mineral contents as the other veins on the property. Some good-grade chalcopyrite was noted on cross-slips cutting the vein at right angles.

From the *Princess May* showing it is about 2,500 feet north along the side-hill, at about the same elevation, to the outcrops on the *Eagle* and *May Queen* claims. A quartz vein about 20 feet wide is exposed along the north wall of a deep canyon in a country-rock of greenstone. The vein strikes N. 50° E. (mag.) and dips from 40° to 60° N. The vein is exposed for a distance of about 250 feet and is composed mainly of honeycombed quartz. Though no work has been done on it, it is a very promising-looking showing, for no doubt a little depth on this honeycombed quartz will find heavy sulphides. There is some enclosed greenstones in the vein and consider-

able residual limonite. It will be rather difficult to attack, since it lies in the bottom of a deep canyon with steep walls.

East of this vein and on the east wall of a small creek flowing into the canyon is a 6-foot quartz vein that will average from 5 to 6 per cent. copper. It parallels the 20-foot vein, but stands vertically, and may therefore be an offshoot from the larger vein. It seems to pinch out to the west across the canyon, but shows about 100 feet farther to the east. Though I did not follow it any farther up, it is said to be exposed in places for several hundred feet, showing in one place a width of 12 feet of 2.5-per-cent. copper and in another place 6 feet of solid sulphides. These showings on the *Eagle* and *May Queen* are the most promising on the property.

Altogether, there is apparently plenty of ore of about 2-per-cent. copper on the surface, and no doubt shoots and lenses of shipping-grade ore would be found in drifting on the different veins. Their situation is very favourable for mining and transportation.

Swamp Point.—The lime-quarries here, owned by the Granby Consolidated Mining, Smelting, and Power Company, are being operated on a comparatively small scale. Bert Wing is furnishing the necessary tonnage on contract.

B.C. Verde Group.

There are eight claims in this group, owned by H. McGuire, of Stewart. They are situated at the head of Bulldog creek, which flows into Portland canal about 6 miles below Stewart, and are at an elevation of 3,300 feet. The trail from the beach goes "straight up" from the mouth of the creek, where there is a small cove very convenient for a landing-place. The property is therefore very accessible and ideally located from a mining and transportation standpoint, the only requirement for the latter being an aerial tramway about 2 miles long from the workings to ore-bunkers on tide-water. From the point of loading to the Granby smelter at Anyox is about 120 miles of inside waterway suitable for scow-haulage. Transportation and treatment therefore offer no difficulties.

The claims were staked last fall and consequently the amount of work done is limited. The showings consist of siliceous lenses, mineralized with pyrrhotite and chalcopyrite, occurring as replacements in a grey andesite, mainly along the contact of the andesite with Coast Range granite. On account of the flat nature of the ground and the consequent heavy overburden of moss and muskeg, all exposures must be made by stripping and open-cutting. As the work so far consists only of a few open-cuts, none of the lenses have been sufficiently exposed to demonstrate their size.

At one point on the contact an open-cut shows a width of 10 feet of quartz fairly well mineralized with pyrrhotite and a little chalcopyrite. South of this, on the west side of a small lake, another shallow cut exposes a width of about 3 feet of fair-looking ore, across which a sample assayed 80 cents in gold and 3.4 oz. in silver to the ton and 1.5 per cent. copper.

The rock formation is locally very favourable for the occurrence of this class of ore, the surface silver values especially being encouraging. Further work in stripping, open-cutting, and sinking is warranted by the surface indications. Everything considered, the property is worth investigating.

Iron Cap Group.—This group consists of six claims adjoining the *B.C. Verde* group and also owned by H. McGuire. No work has been done on them.

Fraser Group.—There are two claims in this group, owned by George Fraser, and adjoining the two preceding groups. These have been recently staked and no work done on them.

Marmot River Section.

(*See* Minister of Mines' Report, 1919.) The Marmot river flows into Portland canal on the east side, about 4 miles below Stewart, from which it is reached by boat. Substantial assistance for trails was given by the Department of Mines during the year, and the section is one of the most accessible in the Division, though small in area.

The Coast Range granites extend up the river for about 3 miles, or about the mouth of the South fork, and beyond this is the Contact Belt. Judging from the several showings of high-grade ore, it looks as if this area would develop a number of small shippers of high-grade silver and gold ore, and the section is therefore very suitable for leasing and individual operating. It has been very active this year and gives good promise.

Patricia Group.

H. C. Magee, of Stewart, and Vancouver associates own this group of claims. It is composed of the *Patricia*, *Silver Link*, *Pat*, *Iron Mask*, and *Monarch*, and is situated on the north side of the main branch of the river, about 4 miles

from tidewater, from which there is a good pack-trail to the camp. At an elevation of 1,600 feet, about 500 feet above the camp, a tunnel has been driven 40 feet (October 4th) at the foot of a bluff, following a small quartz vein in solid granodiorite country-rock. The vein strikes N. 15° W. (mag.), stands about perpendicularly, and is from 6 inches to 1 foot in width. It is composed of quartz, galena, and pyrite, varying from slightly mineralized quartz to solid sulphide. The chief value is in gold, the galena carrying very little silver, and the best ore is a mixture of galena and pyrite, ranging up to $90 to the ton, of which $80 is gold.

At the mouth of the tunnel, which has been widened out to about 10 feet, for a length of 10 or 12 feet, for a blacksmith-shop, the vein lies on the east side and extends up to a slip near the top of the tunnel. This slip cuts diagonally down and across the tunnel and apparently throws the vein to the west 5 or 6 feet. The vein is on the west side of the tunnel from the inside of the shop to the face and has been left standing except for the last few feet at the face, which shows about 8 inches of solid sulphides in the bottom, the upper portion being more siliceous. Since my examination the tunnel has been driven 10 feet farther, showing about the same vein. It has been exposed on the surface in the bluffs above the tunnel about 20 feet beyond the mouth of the tunnel, showing a width of about 2 feet of mixed quartz and sulphide. The favourable situation of the property for mining and transportation should make this ore profitable to work on a small scale.

Mr. Magee informed me that there is a large mineralized belt high up in the bluffs striking at about right angles to the small vein, and therefore probably along the granite-contact. Samples from this belt assaying 200 oz. in silver to the ton have been obtained on the surface. He estimates that the present tunnel would encounter this belt in about 500 feet.

Mr. Magee is one of the first prospectors in the Marmot River section and certainly is deserving of credit for the amount of exploration and development work he has done.

Montana Group. There are seven claims in this group, lying north of the *Patricia* and owned by H. C. Magee and George Bruggy, of Alice Arm. The property was under lease and bond last year to the British Columbia Exploration Company, Limited, which did a little desultory work and obtained an extension of time on the bond. However, nothing further seems to have been done by this company. Shipments of a few tons of high-grade silver ore have been made from time to time, and it would therefore seem that further exploration and development of the property would be warranted.

Engineer Group. There are three claims in this group—*Engineer No. 1, Engineer No. 2,* and a fraction (name unknown). They are owned by George Bunn and Robert Stewart and situated on the east side of Marmot River glacier. They are reached by a pack-trail from the beach to the north side of the glacier; then across the glacier, which is good going for horses, to the mouth of the creek out of Magee pass, a total distance from tide-water of about 7 miles.

The work done by the owners this year consists of a 6-foot tunnel at an elevation of 2,650 feet, driven in on a brecciated vein of quartz and slate. The vein strikes S. 65° E. (mag.) into the hill and dips about 80° E. It is from 6 to 8 feet in width and fairly mineralized throughout with pyrite and chalcopyrite, with a foot of heavily pyritized quartz on the hanging-wall. It has not been traced on the surface beyond the tunnel. The country-rock is an altered sedimentary, apparently very close to the Coast granites. Judging from the amount of red and green andesite float along the north shore of the glacier, there must be a great mass of it higher up or many intrusions through the sedimentaries. This one exposure on the property looks very encouraging, but further work is necessary before attempting any conclusions as to its possibilities.

Prince George Group. This group consists of eight claims—*Prince George, Prince George No. 1, Prince George No. 2, Prince George No. 3, Prince George No. 4, Buena Vista, New Strike,* and *Cussedness Fraction.* They are owned by Woods, Newey, Donald, McNicholl, *et al.,* and situated on both sides of Magee pass, about half a mile up from the north side from Marmot River glacier. At present there is nothing but a goat-trail from the glacier up, skirting the canyon, and it will therefore be difficult to do much development-work until such time as a pack-trail is provided. There should be a trail built from the glacier to serve this group, the *Engineer* group below, the *Washington* group above, and other claims farther up the pass. It would require about 2 miles of trail, which would not be difficult to build. The two claims, *Buena Vista* and *New Strike,* lie on the south side of the pass in granite formation; the balance of the claims on the north side in the Contact Belt.

The only work done on the claims is on the *New Strike* and consists of a few shallow open-cuts put in along the bottom of a narrow, steep gulch possibly formed by the erosion of the softer vein material. These exposures are at 3,550 feet elevation, about 500 feet above the tent-camp site. They show the vein to vary from a seam in the granite to 4 feet in width of heavily pyritized quartz, showing some chalcopyrite and, in places, galena and zinc-blende. One cut discloses 1 foot of solid pyrite and 1 foot of pyritized quartz, the whole running probably 1 per cent. copper. It strikes S. 30° W. (mag.) into the hill and away from the contact and dips 65° W., showing a well-defined foot-wall.

The main values are in gold, the heavier mineralized quartz assaying up to $40 a ton; silver values run up to 10 or 12 oz., with additional values in lead in places. With improved transportation facilities this grade of ore could be made to pay, and the showing therefore warrants further development to determine whether the quantity and quality of the ore are sufficient to mine profitably.

Washington Group.

This group consists of several mineral claims, owned by R. E. Lundvall, of Hyder, Alaska, and Donald, Woods & Newey. The claims comprising the group are *Ellen*, *Ruth*, *Vivian*, *Carrie*, *Black Bear*, *Black Bear No. 1*, and *Castle Hill*, situated north of and adjoining the *Prince George* group and on the north side of Magee pass. The pass or gulch is evidently along the line of contact of the Coast granites with the interior sedimentaries, and the north side is therefore composed of highly altered rock. The country in this vicinity is badly broken up and distorted, probably accounting for the values found in so many different places.

One of the owners, Mr. Lundvall, drove a tunnel 80 feet during the year at an elevation of 3,950 feet, about 1,000 feet above the bottom of the gulch. The tunnel shows argillite, schist, and the face is now in what appears to be quartz porphyry, in which are small veinlets of quartz and iron sulphides. Values were found at different places along the tunnel.

Above the tunnel there are a number of oxidized-iron croppings showing diagonally up the hill. No work of any amount has been done on these, and it is a question whether they are formed from the surface oxidization of the mineral underneath or deposited from surface seepage of iron-impregnated water following down the crevices of the rock. If the tunnel was continued a short distance it would get under these croppings and prove whether or not there is mineral at depth.

Farther up the pass is glacier-filled, with the rock exposed along the banks. Some good-grade silver ore has been found and several well-defined veins have been traced for considerable distances, but the summer season is so short, transportation and every condition for mining so difficult, that little attention has been given them. A pack-trail from the south side of the Marmot glacier could be built by switch-backing up through the canyon to the present camp-site at 3,000 feet elevation, and is very necessary for the prospecting and development of this area.

Fraser Group.

This group is situated on the North fork of the Marmot river, about 3 miles up from the forks. There are seven claims in the group, owned by William Fraser, of Stewart. The area covered by the claims seems to be a mass of pyritized rock, so weathered and oxidized that the bluffs and rock-exposures are stained red and yellow across a width of probably 1,000 feet. What little work has been done shows a few quartz veins, mineralized with pyrrhotite, arsenopyrite, and traces of chalcopyrite, especially along the weathered seams, and said to carry fair gold and silver values. Its general appearance certainly invites prospecting and exploration. I am informed that a lease and bond has been taken on the property by Eastern interests.

North Fork Basin Group.—The owners, Fraser, Wood & Magee, of Stewart, will, with the improvement of the trail this season, now be enabled to make shipments of their high-grade silver ore.

Idaho Group.

This group consists of eight claims—*Gem of the Mountain*, *Lucille*, *Never Sweat*, *Prickly Heat*, *Nettie L.*, *Sunday*, *Slide*, and *Perseverance*—owned by Clay Porter, George Mehlfeld, J. McCallum, and Lee Levine, the latter two each owning a half-claim. The claims are situated about 4 miles up the North fork of the Marmot river, on the west side of the glacier, about 1,000 feet above it, and 4,000 feet above sea-level. Heretofore the property has been reached by following a North Fork trail to a short distance above the Government cabin, and from there up the glacier to a point at the bottom of the gulch below the camp. I understand that the trail was extended up the east bank of

the glacier to a point opposite the camp this fall, which will admit of pack-horses being taken from the beach to the end of the trail, and from there across the glacier about a mile to the foot of the hill. From this point a switchback trail can easily be built up to the camp. Ore can be lowered from the tunnel to the glacier, sledded across the glacier, and packed to the beach, a distance of 6 or 7 miles.

At an elevation of 4,000 feet the owners have driven a tunnel 80 feet during the past season, of which the first 40 feet had to be timbered. This follows a small seam of oxides, in which are small kidneys of galena carrying high silver values. The main vein was encountered at 80 feet and drifted on for about 10 feet at the time I was on the property, October 6th. This vein strikes N. 60° E. (mag.) and dips into the hill about 45° N. It consists of siliceous material about 2 feet in width, lying in the prevailing country-rock at this elevation of andesite schist. On the foot-wall there is about 6 inches in width, in which are lenses of galena carrying silver sulphides, probably stephanite, assaying from 400 to 1,950 oz. to the ton in silver; the balance of the vein of 18 inches is a siliceous rock mineralized with fine-grained iron pyrites and probably silver sulphide, though none were seen in hand samples, assaying from 300 to 400 oz. to the ton in silver. The owners were sacking ore, but I believe did not get any shipped before winter necessitated closing down the work.

Porter and Mehlfeld, who were on the property, stated that they had discovered several small parallel veins of similar high-grade ore above the tunnel, and two large veins of quartz carrying grey-copper, resembling the *Silverado* veins, on the Portland Canal side of the summit and at no great distance from the *Idaho* group.

The values in and size of the showing on which they are working are certainly very promising for profitable mining, and altogether the owners are very optimistic of the probabilities of their holdings. They surely deserve credit and success for the work they have accomplished under most discouraging conditions.

North Fork Basin.—This basin is of limited area and has been practically entirely staked. With a good trail it is very accessible and handy from the beach and justifies very close, thorough prospecting for the characteristically small high-grade veins.

Bear River Section.

(*See* the contour and mining property map of Bear, Salmon, and Marmot Rivers sections accompanying this report.) The reader is also referred for geological data to Memoir No. 32, by R. G. McConnell, published by and obtainable from the Geological Survey of Canada, Ottawa. This is one of the important sections of the North-western District and includes all the country north of the head of Portland canal, tributary to the Bear river, to Bear River divide.

The Portland Canal Short Line Railway extends from Stewart to the *Red Cliff* mine, 14 miles up the valley, and there is also a fair wagon-road covering the same distance; from there on a good pack-trail extends over the divide to the Groundhog coalfields. It was realized when the railway was built that this valley, with its low divide at the head of Bear river, is the logical outlet for all the northern interior part of the Province lying east of the Alaska strip, and doubtless it will some day be utilized for that purpose.

It so happens that the break in the Coast range occupied by Portland canal and its extensions, the Salmon and Bear River valleys, throws a portion of the Eastern Contact Belt, about 20 miles long, on the Pacific slope, but there are about 60 miles north of this break to the Iskut river of the same mineral-belt lying on the interior or eastern slope of the range and only accessible by way of the Bear River valley. A start should be made toward the exploration of this belt by starting a trail, branching from the Bear River trail on the other side of the divide, northwards along the eastern slope on the mineral zone.

Mining, so far as outside operators were concerned, was at a standstill in this section until the Silverado Mining Company started, but much prospecting and developing was done during the year by property-owners. It is hoped that improved money conditions will enable the smaller mining operators to take over and develop some of the promising propects of the section. Apparently, the larger companies are content to wait and pay for a developed property rather than take a chance on developing a mine from a prospect.

Silverado Group. The Silverado Mining Company, Limited, was incorporated in October, 1921, with a capitalization of $200,000, divided into 2,000 shares; the head office of the company is in the Vancouver Block, Vancouver. The company's holdings consist of the *Silverado* group of five claims—*Silverado No. 1, Silverado No. 2, Silverado No. 3,*

Rainier Bluff Fraction, and *Silver Bell No. 4*. They are situated on the east side of the mouth of Bear river, just south of the glacier opposite the town of Stewart, at an elevation of about 4,000 feet. The group was staked and owned by John Haahti and J. W. Stewart, of Stewart.

The property was acquired by J. J. Coughlan, of Vancouver, in August, and work started in the latter part of that month. Previous to this it had been under lease to Haahti & Peterson, who had driven a tunnel 30 feet long and done some little stoping, extracting about 15 tons of ore. This was sorted to two grades, the first class being a clean grey-copper assaying over 600 oz. to the ton in silver and the second grade assaying between 250 and 300 oz. to the ton in silver. The vein as exposed by this work, as well as the cropping along the bluff, is from 6 to 18 inches wide and lies horizontally in grey andesite country-rock. The gangue is quartz uniformly well mineralized with grey-copper and pyrite, the former predominating, and averaging better than 125 oz. to the ton in silver. The pure grey-copper assays about 1,000 oz. to the ton in silver. This small vein is exposed for a length of 200 feet or more along the base of the bluff at 4,200 feet elevation, and, judging from the quantity and quality of ore extracted, there is probably over $35,000 worth of ore exposed.

A small shipment of ore was made in 1921; 5 tons of "low grade" gave an assay of 299.36 oz. of silver to the ton and 3.62 per cent. of copper; 2 tons of "high grade" or hand-sorted grey-copper assayed 696.6 oz. of silver to the ton and 7.76 per cent. copper.

Since the present owners took over the property a great deal of outside work has been done under most unfavourable weather conditions. A trail about 5 miles in length was built from the east bank of Bear river to the upper camp at 3,850 feet elevation. Camps were established at 1,700 and 3,850 feet elevations as terminals of a tramway, the upper terminal camp to be utilized later for the mine camp. A 2-bucket tramway nearly a mile in length was constructed and the upper terminal connected with the tunnel by a single-cable tram about 1,000 feet in length. Ore can therefore be lowered to the lower camp, from which point it will be rawhided to the beach.

It was realized that a complete tram from the mine to tide-water could not be built in the limited time before winter; consequently the upper portion only, covering ground that will be impossible for winter transportation with horses, was built this season. It will very probably be completed to the beach next season.

There are two large, almost vertical, veins above the small flat one now being worked which can be attacked for development around the north side of the hill on a level with the present tunnel. These veins are from 3 to 6 feet wide and consist of quartz well mineralized with grey-copper and pyrite. On account of a light snowfall I was unable to see them, but from a description I judge that they will very probably develop a sufficient tonnage of good-grade milling-ore to justify the erection of a milling plant. The property has, with the small high-grade vein paying its way, a very favourable chance of becoming an important producer.

Mobile Group. This group is owned by H. P. Gibson and Louis Legge, of Stewart, and Al. Harris, of Vancouver. It consists of four claims, situated at an elevation of 3,700 feet on the east side of Bear river, just south of the claims of the Portland Canal Mining Company. The showings are reached by the old Portland Canal mine-trail, passing the mine camp and continuing on up the hill for less than a mile. There is a splendid camp-site right at the showings, with plenty of timber for cabins and fuel.

No development-work has been done other than the necessary yearly assessments, consisting only of open-cuts and stripping, the greatest depth obtained being about 10 feet. The lowest cut is at 3,700 feet elevation and the highest at about 4,000 feet, tracing the vein several hundred feet on the surface. Fair depth could be obtained by drifting on the vein from the lowest cut, or even greater depth by tracing the vein farther down the hill to start a drift. The cuts show an oxidized width up to 6 feet, in which are ribs of quartz and slate with quartz through it up to 24 inches wide. The quartz is mineralized with pyrite, galena, and zinc-blende, and carries varying amounts of grey-copper, argentite, and ruby-silver. The general rock formation is argillite (McConnell's "Bitter Creek formation") and its contact with the greenstones cannot be a great distance down the hill. The mineralization appears to be a sheared zone in the argillite, replaced by bands of quartz for a width of from a few inches to 24 inches, the balance of the vein being an oxidization through the soft, sheared material. I do not think that quartz for the full width of the shear may be expected.

Tide Lake, on Salmon-Nass Rivers Divide.

Mitre Mountain, on Salmon-Nass Rivers Divide.

UNIVERSITY OF ILLINOIS LIBRARY

The solid quartz, varying from 4 to 8 or 10 inches wide, carries the values, and not the quartz found as stringers in the slate. A sample of three or four pieces of quartz from about 4 inches of width in the lowest showing, mineralized with pyrite and a little galena and grey-copper, assayed 103.4 oz. in silver to the ton. An average sample from several cuts, representing ore that would be sorted out and shipped, and varying from 4 to 10 inches in width, gave assays of $2.80 in gold and 314 oz. in silver to the ton, 11 per cent. lead, and 4 per cent. zinc. A persistent streak of a few inches in width of this grade of ore could be mined profitably. The vein could be worked in as many places as desired on the surface, taking out the ore to a depth convenient for handling; at the same time a drift could be run on the vein at a lower level to determine what the conditions were at depth.

A trail could be easily built from the Portland Canal mine trail and the ore packed on horses down to the wagon-road at the Portland Canal concentrator, and from there hauled to the dock for shipment, a distance of about 5 miles. If the ore developed sufficient tonnage an auxiliary tram could be run from the workings down to the head of the Portland Canal tram, and this latter utilized to take the ore to the wagon-road at the lower terminal. The propery might make a very profitable little shipper.

Dandy Group. This group consists of four claims—*Dandy No. 1, Dandy No. 2, Star No. 1,* and *Star No. 2*—the first two being restakings of two of the claims of the old *Main Reef* group. The owner is Heine Horstman, of Stewart. The claims are situated on the east side of Bear river, about half-way between Glacier and Bitter creeks, at an elevation of 1,600 feet. There is a good trail to the old camp from the Bear River wagon-road, passing the *Tyee* cabin at 425 feet elevation and the *Mayflower* camp at 900 feet elevation.

The vein on the *Dandy* claims is about 4 feet wide, of broken-up argillite crossed with small quartz stringers, with a continuous small vein of quartz on the hanging-wall mineralized with zinc-blende and galena, principally the former. It lies in argillite country-rock on top of a greenish porphyry dyke about 40 feet wide. It strikes N. 30° W. (mag.) and dips 63° W., conforming with the strike and dip of the dyke.

The vein cuts diagonally across the creek and here shows only a seam of ore on the hanging-wall containing very little values. On the west side of the creek a tunnel was driven a considerable distance in the early days, but the mouth of it is now blocked up by a jam of debris in the creek, which has piled the creek-gravel over the top of the tunnel. This tunnel could not have gained much depth in a couple of hundred feet, as the surface above does not rise very rapidly. A shaft is said to have been sunk to a depth of 40 feet just inside the mouth of the tunnel, following a shoot of good ore from 12 to 14 inches wide all the way down, but I doubt it from the appearance of the rest of the vein exposed. However, it would not be a difficult undertaking to clear out the creek and get into the tunnel to unwater the winze. If there is a foot of $75 ore, or even less, in the shaft, it will pay to mine and ship, as it is not over 2 miles down to the wagon-road and a 6-mile haul from there to the dock.

Tyee. This is one of the old properties worked on in the early days of the camp and is owned by Jim McKay and Charlie Bibeau, of Stewart. A shaft was sunk about 40 feet on a heavily pyritized vein, about 4 feet wide, of quartz and altered granite occurring in a granite stock. The ore carries some gold and silver values, but not enough to ship. The sulphides are too heavy to admit of sufficient concentration to raise the values to a shipping grade. A crosscut tunnel is now being driven by the owners to cut the vein, I should judge, a little lower than the bottom of the shaft and some distance to the north.

Evening Sun and Columbia. These claims were reported on in 1919, since which time, W. W. Rush, the owner, has been working on them each season. I did not get up to them this year, but Mr. Rush informed me that he is continuing the tunnel on the *Evening Sun* claim, and that conditions have not materially changed since the last examination was made.

Excelsior and Eagle. These claims belong to W. W. Rush, of Stewart, and A. Baggs, and were also reported on in the Minister of Mines' Report of 1919, page 72. Mr. Rush was working on the claims this summer, driving a tunnel on what he calls the "spur" vein. This is now in about 30 feet, with high-grade ore up to a foot in width all the way. A depth of 25 or 30 feet has been gained at the face.

Other Claims.—Nothing new is reported on the *Lakeview*, *Sunshine*, and *L. & L.* groups, described in the 1919 Report; the *Ruth and Francis* claims, in 1918 Report; or the *Dunwell*, in 1920 Report.

L.L. & H. Group. This group was under bond to Charles Tubman, of Victoria, last year, and was briefly described in last year's report. This year Mr. Tubman found it impossible to finance further work and the property was returned to the owner, Jack Harkley, of Stewart. Mr. Harkley and two men are working on the property all this winter, driving the crosscut tunnel ahead for the purpose of cutting all the veins exposed on the surface. No information is available as to the results of the work to date.

George Copper-mines.—Further work was done by the owners this year, mostly in trail-building. The property has been fully described in former reports.

Red Top Group. This group was reported on last year, when it was under bond to G. Seiffert, of Seattle. He was, however, unable to go ahead with the work this spring and the bond lapsed, the property reverting to the owners, J. McNeil and J. J. Connors. They have been working, continuing the lower tunnel near the cabin, which Mr. Seiffert had driven 132 feet toward crosscutting a surface exposure of copper ore. Nothing is known as to the outcome of this season's work.

Vetron and Comet Groups.—Yearly assessments were done by the owners, Ben Erickson and W. Forrest. The reader is referred to last year's report for descriptions of the property.

Red Cliff Group. The property of the Red Cliff Mining Company, Limited, was purchased in the spring by R. W. Wood and associates. This summer a small crew under the supervision of R. L. Clothier, of Stewart, did some surface work on the showings on the upper claims. Values, however, did not prove encouraging and work was discontinued.

Independent Group. (*See* 1919 Report.) This group is situated on Goose creek and consists of six claims, owned by Sam and Jack Fitzgerald, of Stewart. Last year the property was under option to the Algunican Development Company, a Belgian syndicate under the local management of W. A. Maloche, which has since become defunct. This company put a diamond-drill on the ground and drilled two holes totalling 508 feet. The drill-station was about 120 feet south of the vein exposed on the surface by an open-cut. The vein strikes N. 65° to 70° W. (mag.) and dips 70° to 75° S.W. toward the drill-station. The first hole, 240 feet deep, was on a bearing of N. 7° W. at a declination of 31°, and would therefore intersect the vein at about 150 feet from the collar and at a depth of about 100 feet on the vein. The ground proved soft or broken up at this point and a very poor core was obtained and values were reported low. The other hole was 268 feet deep, flat, and on a bearing of N. 45° W. (mag.), and therefore was about 75 feet from the vein when stopped.

This year's work was done lower down the hill at 1,750 feet elevation, about 1,400 feet below the cut on the vein near the drill-station, and consists of a tunnel driven 25 feet, intersecting a vein seen cropping above. The face had just reached the vein, and a small sample taken therefrom gave a trace of gold and 3 oz. in silver to the ton and 1.5 per cent. copper. The vein is quartz showing considerable chalcopyrite and pyrite in places. The country-rock is andesite.

At an elevation of 3,150 feet, the level of the drill-station, the open-cut on the vein has exposed it for its full width of 14 feet. Across the face of the cut, which is about 10 feet high, the main portion of the vein is shown to be about 5 feet wide and to occupy the centre of the vein. This portion is heavily pyritized quartz, with some galena and zinc-blende, in which the principal values are silver, with a little gold. On the hanging-wall side of this is a small basic dyke about a foot wide, and bordering the quartz and dyke on each side is a siliceous rock in which are bands of quartz and a reddish, jaspery-looking quartz, also heavily mineralized with pyrite, and traces of galena and zinc-blende. The mineralization is much stronger in the bottom of the cut. Average values of $12 a ton are claimed across the whole 14 feet.

Farther up the hill at 3,500 feet elevation an open-cut has been driven on a vein about 8 feet wide, with a porphyritic dyke showing on the foot-wall. This vein strikes N. 65° W. (mag.), stands about perpendicularly, and is thought to be the same as disclosed in the 3,150-foot open-cut. The gangue is a mixture of quartz, calcite, and the reddish quartz resembling jasper, the same as in the cut below, contains considerable pyrite and traces of galena, and is

claimed to assay $10 to the ton in gold and silver across the 8 feet. Judging from the sulphide contents, the ore would concentrate from 10 to 15 into 1. The gangue here has a marked resemblance to the *Toric* vein, in the Kitsault River section, in the same rock formation—andesite.

Farther up the hill, probably 75 feet, and to the north of the last showing (apparently a dyke intervening) is another showing about 20 feet wide of the same kind of vein-filling. Only a couple of shots have been put in here, but the freshly broken rock shows about the same mineralization as in the previous cut. A sample of a number of pieces broken out by the shots assayed 80 cents in gold and 28 oz. in silver to the ton and a trace of copper. With their fair silver values for the surface, these upper showings look very promising to me and I would confine future work to them rather than to the tunnel or cuts below.

M.C. Group. This group was staked last fall by C. A. Mackenzie, of Victoria, and consists of the following six claims: *M.C.*, *M.C. No. 1*, *Britain*, *Britain No. 1*, *Nine of Hearts*, and *Nine of Hearts No. 1*. They are situated on the crest of Bear River ridge, beyond the *Prince John* group, at an elevation of about 6,000 feet. There were two or three men working on the claims for a time this summer, but as there was no one there at the time I was in the section I did not get up to them. I have no information as to the showings, work, etc.

Prince John Group. (*See* Report of 1919.) This property is situated on the west bank of Bear river, about 5 miles above Stewart, and is owned by J. Nesbitt and Andy Archie. There has been considerable work done on the claims by way of open-cuts, stripping, and crosscut tunnel at 2,350 feet elevation, driven 185 feet across the formation. The cross-section exposed in the tunnel shows 35 feet of greenstone-schist from the portal; then 45 feet of banded slate mineralized with pyrite and chalcopyrite, disseminated in grains throughout the slate, and in small veins and bunches along the bedding-planes and cross-fractures; then 45 feet of a light-grey acidic dyke; and beyond that 65 feet of slightly mineralized slate to the face. The 45-foot section of ore would probably average about 2 per cent. copper and $1 to the ton in gold and silver values.

Some further surface work was done this summer by Mr. Nesbitt and some beautiful specimens of free gold found. It occurs in the banded slate, in which the sulphides have been decomposed and replaced with a spongy gold. I tried to get up to see the work, but on account of high water we were unable to get along the river-bank.

This and all the claims along the west side of Bear river, from the Government bridge to Bitter creek, have always been badly handicapped in having no trail along that side of the river.

Bayview group was reported on last year and nothing has been done on it this year.

Salmon River Section.

This portion of the Portland Canal Mining Division is the drainage-basin of the Salmon river in British Columbia, and represents about 7 miles in length and about 60 square miles on the Eastern Contact Belt, which is here conveniently situated on the Pacific slope of the Coast range.

The area has been given a great deal of prominence by the remarkable development of the *Premier* mine, which has this year shipped about $1,750,000 worth of gold and silver, and, furthermore, has exposed ore valued at many more millions. This will undoubtedly guarantee the exploration and development of the remainder of the basin, in which there are many meritorious showings. It also gives an idea of the potentialities of that portion of the same mineral-belt extending 250 miles north to the boundary of the Province. This mineral-belt is one of the greatest assets of the Province, and it should be its endeavour to open it up wherever feasible by the construction of trails and roads and improvements to navigation.

In this Salmon River section the lower end of the basin is served by a wagon-road from Stewart to the *Premier* mine; beyond this is reached by trails, which have served their purpose for prospecting and partially developing the upper valleys. That area is now past the prospecting and hand-work stage and requires the extension of the wagon-road for another 5 or 6 miles to provide means of transportation for taking in machinery for more extensive development and taking out helpful shipments of high-grade ore showing on many of the properties. About 2 miles of this road was built two years ago and the continuation of this, even as a winter road, would be most useful. The present trails should be extended over the Salmon

River and Long Lake divides to the Nass slope, and thus enable prospectors to get supplies into that country and explore it with some degree of efficiency, and so extend the known mineral areas.

Outside of the operations of the Premier Company, the section has had a very quiet and uneventful year in mining. Though there has been a lot of individual work done, there has been no development of importance and few, if any, properties are in better condition than last year. The quiet year may, however, prove beneficial, in that it may do away with the inflated valuation placed on properties which are as yet only in the prospect stage in this and other sections where there has been a little mining activity in the past two or three years.

There are several properties on the Alaskan side of the boundary, both in the Fish Creek basin and on the east side of the Salmon River valley, that have had an appreciable amount of development during the year and are reported to have the ear-marks of becoming important producers.

It is worthy of mention that the Alaska Commission has definite plans regarding the construction of a wharf and approach at Hyder, and that appropriations have been made for this work and the completion of the Salmon River highway from Hyder to the boundary-line at 13-Mile.

S. J. Schofield, of the Geological Survey of Canada, in his Summary Report recently issued, divides the ore-deposits of this section into three main types—base-metal type, silver-gold type, and gold type. The following excerpts from his report give his conclusions on each type: "The usual mode of occurrence of this type (base-metal type) is that of replacement and dissemination in certain beds of tuffs and tufaceous conglomerates, though veins occur containing the base metals. The deposits are roughly tabular, since they correspond in strike and dip with the beds with which they are associated. The minerals present in these bands are pyrite, chalcopyrite, sphalerite, and galena in a gangue of quartz. Nearly all the examples of this type occur in the *Big Missouri* ridge. The alteration or metamorphism of the rocks on the *Big Missouri* ridge makes their determination very difficult, if not impossible in many cases, so that the contact between the quartz porphyry and the tuffs was not definitely recognized, and it is certain that over the greater part of the *Big Missouri* ridge this contact is buried underneath the tuffs and the tufaceous conglomerates.

"The ores of the silver-gold type occur in veins and vein-like replacements in quartz porphyry and at the contact of the porphyry and the tuffs. The large ore-shoots are lenticular in shape. The minerals present are pyrite, chalcopyrite, sphalerite, galena, tetrahedrite, freibergite, pyrargyrite, and other sulph-antimonides and sulph-arsenides, native silver, and gold. The gangue is rather abundant and almost entirely quartz. (The *Premier* is cited as an example of this type.)

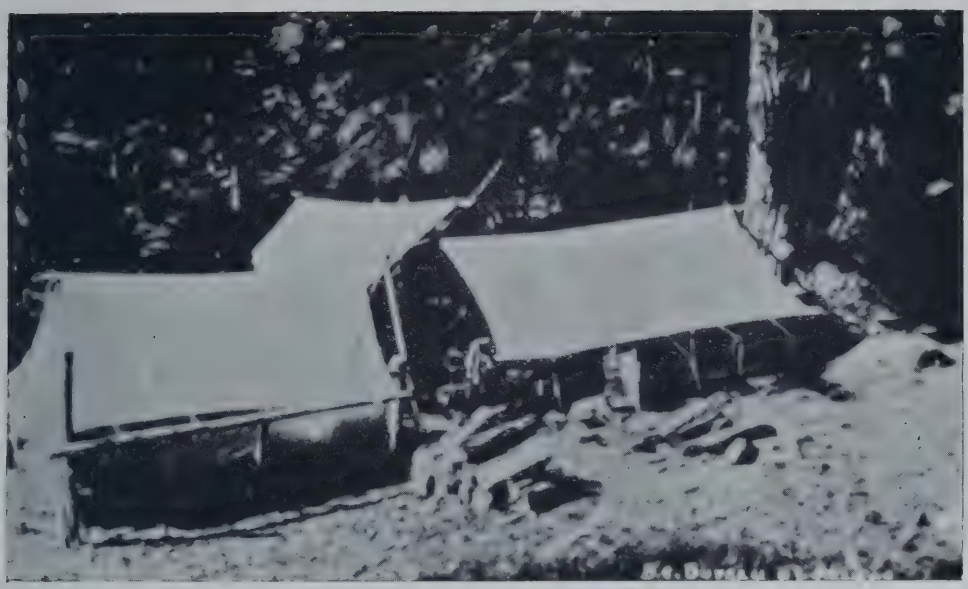
"A single ore-body in No. 2 tunnel of the *Premier* mine is of this type (gold type). This is a siliceous, heavy-sulphide deposit. Quartz and pyrite are the predominant minerals. Small quantities of chalcopyrite, sphalerite, and galena are present. Assays show high values in gold, but practically no silver.

"The ore-deposits fall into three main groups: (*a*) A low-grade, complex type, with values in the base metals, copper, lead, and zinc (*Big Missouri, Hercules, Forty-nine*, etc.); (*b*) a type rich in silver minerals, including tetrahedrite, freibergite, pyrargyrite, argentite, and in some cases native silver (*Premier, Silver Tip*, certain ore-bodies of the *Forty-nine, Big Missouri*, and *Mineral Hill*); (*c*) a pyritic siliceous type, with high gold values (an ore-body in the *Premier* mine).

"The most favourable associations for the occurrence of ore are as follows: (*a*) In the quartz porphyry; (*b*) at the contact of the quartz porphyry with the tuffs; (*c*) in certain beds of the tufaceous conglomerate.

"The slates in general do not appear favourable for the deposition of ore. The sulphides rich in silver, such as tetrahedrite, freibergite, argentite, and some of the pyrargyrite, are considered to be of primary origin and will continue in depth. The native silver is considered to be of secondary origin."

Several examinations were made during the season and two or three important deals are pending which, if successful, will mean a great deal to the development of the Salmon River section.



Premier Mine—First Camp of Discoverers, Bunting and Dilworth.

Premier Gold Mining Co.—Mill.

UNIVERSITY OF ILLINOIS LIBRARY

Premier Gold Mining Co.

This company has this year accomplished a great deal in all the departments, mining, milling, surface equipment, and transportation, and the property has now reached the stage where there should be no more serious handicaps to interfere with maximum production. With the completion of the tramway from the mine to the beach the greatest difficulties have been overcome. Mining for the year consists of extensive development-work, about 4,000 feet, on all three working-levels. On the No. 1 level, at 2,000 feet elevation, the south vein was located by diamond-drilling, crosscuts run from the No. 1 tunnel, and the south stope opened up. It shows a length on this level of about 200 feet of the same lenticular character as the north vein and with like enrichments along the fault-seams. The greater portion of the ore shipped last winter and this summer, amounting to over 4,000 tons, was taken from below the No. 1 level on the north vein and above the No. 1 level on the south vein. On the No. 2 level, 1,750 feet elevation, a long crosscut and drift picked up the south vein and the stope is now being opened up above this level. The south vein on this and No. 1 levels is supplying all the ore to the concentrator, over 100 tons a day, and considerable shipping-ore as well, found along the cross-slips. The No. 4 level, 1,325 feet elevation, has been driven ahead from the face of the old *Plate* tunnel, and at the time I was at the property (January 1st, 1922) had about 200 feet to go before it was expected to encounter the south vein. When this vein is opened up it will prove the ore-shoot to a depth of about 700 feet below the surface, and should the values hold as good as the upper levels will mean several millions of dollars' worth of probable ore. When both veins are raised on from the No. 4 level and the ore blocked out and "in sight," then a fair estimate can be made of the value of the ore. It has just been reported in the press that there are $80,000,000 worth of ore in sight, which may prove true, but is an absurd statement to make at the present stage of development.

Diamond-drilling was being done on the No. 4 level and one or two drills have been in operation all year, totalling 6,800 feet of drilling. A raise has been put through from the fourth to the second level and equipped with a hoist and cage for a thoroughfare from the No. 4 camp to the upper camp, where the main office is located.

Of the ore-bodies, S. J. Schofield says: "The ore-bodies in the *Premier* mine follow closely the contact between the quartz porphyry and the tuffs, both of which are highly altered. Up to the present no ore has been found entirely enclosed in the tuffs, but several lenses occur in the quartz porphyry. The chief locus of the ore-bodies, however, is the tuff-porphyry contact. The ore-shoots are in the form of lenticular veins, in most places about 10 feet in thickness. They have been formed partly by fissure-filling and partly by replacement of the tuff and quartz porphyry. The ore-bodies, which strike N. 75° E. and dip 70° N., are cut by several faults and shear-zones."

Surface improvements and equipment at the upper camp include new buildings for hospital; residences; bunk-house, and improvements and additions to the old ones; change-house, using open cages in which men hang their clothes, hoist them to the ceiling out of reach, and lock them when not in use, doing away with the old locker system; mine warehouse and office, etc. At No. 4 camp, at the mouth of the No. 4 or main working-level, much construction has been done and a great deal of equipment installed; a new bunk-house, with up-to-date accommodations; snow-shed; concentrator; upper terminal tramway; blacksmith-shop, equipped with machine-drill sharpener and oil-burner for heating steel; compressor building, housing two 150-horse-power Fairbanks-Morse semi-Diesel engines, compressors, lighting plant, and well-equipped machine-shop. An auxiliary consisting of two 150-horse-power Fairbanks-Morse semi-Diesel engines has also been added to the power plant.

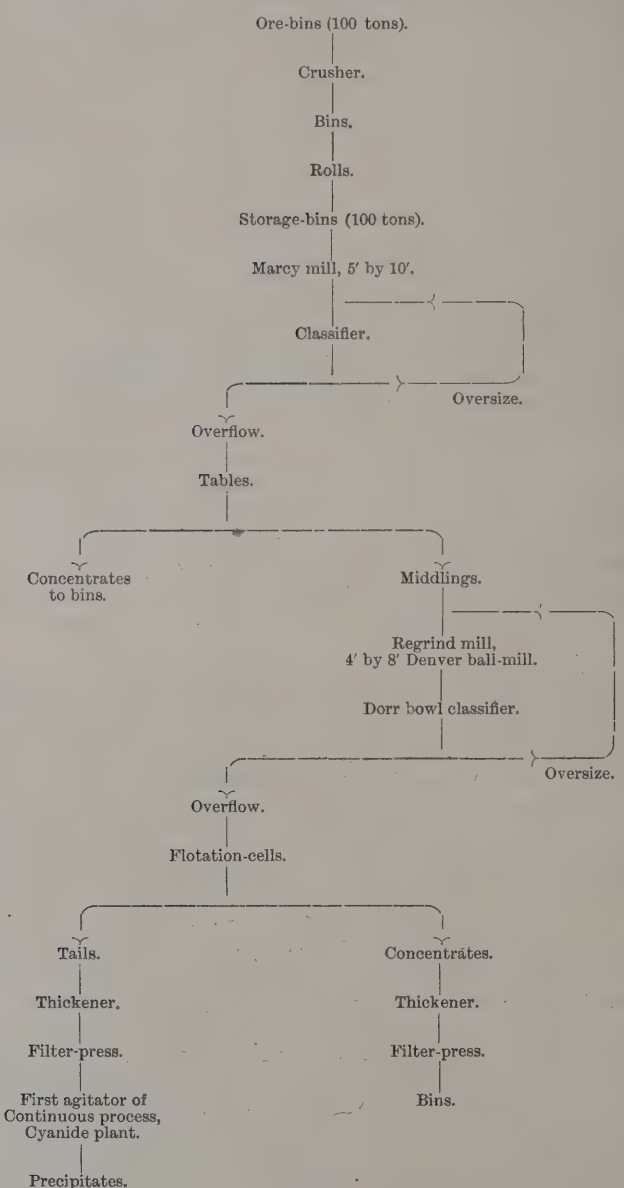
Transportation from the dock to the mine, a distance of about 15 miles, has been the greatest handicap to the development of the property. It was therefore decided to install a tramway and work was started this spring as soon as weather conditions would permit. The contract was let to the Riblet Tramway Company, Spokane, Wash., and that this company was able to complete it and have it in operation for January 1st, 1922, is a very creditable piece of work. It is 11½ miles in length, in four sections or with three angle-stations, and with a tension tower on an average of about every 4,000 feet. The difference in elevation between the upper terminal at No. 4 level of the mine and the lower terminal at the dock is about 1,325 feet. The power required to operate it is a 50-horse-power motor geared to the bull-wheel at the upper terminal. There are 153 towers in the entire distance. There are 120 buckets being used at present of 800 lb. capacity each, and as it takes less than two hours for a bucket to travel the 11½ miles,

it means a bucket dumped every two minutes, giving a capacity, at full speed, of about 12 tons an hour, which will be cut down somewhat when handling return freight.

The mill was started in July and has been running continuously, except for minor close-downs for repairs and alterations. On account of the complex nature of the mill-feed, especially its variations in silver-sulphide contents, its treatment has presented many complications and necessitated some small alterations in the mill from the original flow-sheet.

The mill was designed for treating 100 tons of feed in twenty-four hours, but has been running over capacity and producing from 20 to 30 tons of concentrates a day. The following is the present flow-sheet of the mill:—

Flow-sheet of Premier Mill, Salmon River, Portland Canal.



The ore-bunkers at the lower terminal have a capacity of 1,500 tons and are so arranged that boats are loaded directly from them by means of a travelling belt. They are housed in a three-story building 300 feet long. The lower floor on the dock-level is used as a warehouse

and storage and also contains the loading-belt. The next floor is a warehouse and the top floor is the lower terminal of the tramway and therefore the dumping and loading floor. A small hoist and incline truckway has been arranged for taking freight from the dock-level to the second or top floors. A heating plant will be installed for the double purpose of keeping perishable supplies and the ore from freezing in the bunkers.

I understand that all adjustments have been made on the tramway and that it is now working perfectly, delivering about 100 tons of ore a day. Its necessity can be appreciated when it is realized that the company has been using from forty to sixty horses and two 5-ton caterpillar tractors for hauling throughout the year, and has handled upwards of 6,000 tons of freight from the dock to the mine over the wagon-road.

The shipments from the mine this year amounted to 4,356 tons of ore, and from the concentrator 1,000 tons of concentrates and about 9,000 lb. of precipitates from the cyanide plant, the total production yielding 35,000 oz. gold and 1,200,000 oz. silver, valued at $1,400,000.

The perfected facilities for handling ore now from the mine to the dock should greatly increase shipments in the future, and will probably enable the company to ship a medium-grade ore, such as their siliceous gold ore, or ore not too high in silver values, but too good for mill-feed, to the Granby smelter at Anyox.

Credit is due the energy and efficiency of the general manager, Dale L. Pitt, and assistant manager, Bert F. Smith, for the progress made in the past two years and for the very capable organization they have built up.

The majority of the properties in the Salmon River valley have been described in previous Reports (1918, 1919, and 1920), and since there has been little development-work done this year, other than the yearly assessments, I did not make any examination beyond the *Premier*.

E. H. Bartholf and a couple of men worked on the claims of the Outland Silver Bar Mines, Limited, all summer. This company was incorporated in July, 1920, with a capitalization of $500,000, divided into 500,000 shares, with its head office in Vancouver. The company's holdings consist of six claims on the west side of Salmon glacier, about opposite the *Forty-nine* and south of the West arm of the glacier, and therefore in Schofield's "belt of dykes." The work has consisted of open-cutting and the owners report that good showings of steel galena carrying high silver and good gold values have been exposed.

Fish Creek Mining Co.

The holdings of this company consist of fifteen full claims and two fractions, situated on the Alaska side of the boundary-line, at the head of Fish creek, which empties into the Salmon river about 4 miles up from Hyder. W. Tonkin, of Seattle, is president and manager of the company and Harry Tanner has charge of operations at the property. The claims were staked about 1910 by Dan and Andy Lindeborg and acquired a year or two later by the present company. A great deal of work has been done on the different showings on the claims in the last five or six years. Three tunnels were driven on the *Olympia* claim, the lower about 100 feet long; on the *Nevada* claim, two tunnels; and on the *Starboard* claim, two tunnels.

This year's work was confined largely to the development of a well-defined vein recently discovered on the *Olympia Extension* claim, cropping on the divide between Skookum creek and Salmon river at an elevation of 3,000 feet. It strikes north-east and south-west and dips about 70° to the north-east. A number of open-cuts were put in on this vein, tracing it for about 600 feet on the surface, exposing a quartz-filled fissure mineralized with pyrite, galena, and grey-copper. The heavy galena and grey-copper carry high values in silver, the pure grey-copper assaying over 1,000 oz. to the ton. Several tons were sorted and shipped from the surface. A crosscut tunnel 140 feet long was driven, cutting the vein at about 60 feet depth and showing it to be about 7 feet wide, of which 2 feet is good shipping-ore and the balance a good-grade milling-ore.

A substantial camp was built near the portal of the tunnel at 2,825 feet elevation on the Salmon River slope, to which there is a good trail up Fish creek. Work will be continued throughout the winter, to consist of drifting both ways on the vein, sinking on the ore-shoot at the intersection of the crosscut tunnel with the vein, and the sorting, sacking, and shipping the ore that can be taken out in this work. About 20 tons was shipped during the summer and 20 tons more sacked ready to rawhide down to the wagon-road.

With the considerable tonnage of 300-oz. ore in sight and good transportation, there should be no reason why the property should not be developed into an important producer. Mr. Tonkin

informed me that it was the company's intention to install a compressor early in the spring, and a suitable concentrator, probably a flotation plant, as soon as possible.

New Alaska Group.

This property is comprised of a group of claims lying just across the Alaska-British Columbia boundary-line on the Alaska side and near 11-Mile on the Salmon River road. This group was under option for over a year to Charles Caldwell, who drove a tunnel without results sufficiently encouraging to continue. This fall the property was bonded to Pat Daly by the owners, Charles Knipple, Dan Davis, and Bill McGrew, and a small crew under Mr. Daly's supervision has been kept on development-work since.

The upper claims of the group are traversed by a broad zone of mineralized, silicified greenstone-schist of the Bear River formation. Stripping and open-cutting on this zone this fall exposed a width of about 40 feet of more pronounced mineralization, showing bunches and small lenses of galena, carrying good silver values, extending for several hundred feet along the outcrop. A tunnel was started on the north bank of a creek, cutting the zone, and in the 15 feet driven shows similar ore to that exposed on the outcrop several hundred feet away. Altogether the showing on this property is very encouraging and warrants extensive development.

Other properties on the Alaska side of the boundary-line are: The *Hoveland* group, staked and owned by J. Hoveland, of Hyder, Alaska, who has driven a tunnel 100 feet long and made numerous open-cuts and trenches on the vein, which is said to be a very persistent quartz vein, heavily iron-stained, and carrying good gold values in places. The *Riverside* group, probably better known as the *7-Mile* group, situated at 7-Mile, on the Salmon River road, is owned by Dan and Andy Lindeborg. Two tunnels, totalling over 200 feet, have been driven on a pyritized quartz vein lying in massive granite, showing considerable galena in places, the presence of which generally assuring good gold values. A small concentrating plant warranted by the ore already exposed should pay for further development, with a good chance of making a profitable small producer. The *Lucky Boy* group on Fish creek, owned by Pat Benson and associates, has had a tunnel 100 feet long driven, starting in the face of the bluff at Fish Creek falls. At about 80 feet from the portal there is a showing of 6 or 8 inches of mixed pyrite and galena showing on both walls of the tunnel. Another tunnel above the falls has been driven 12 feet and a winze sunk at the face. The *Fitzgerald* claims are said to have a promising-looking showing.

A branch trail from the Salmon River wagon-road was built up Fish creek this summer by the Alaska Road Commission.

STIKINE AND LIARD MINING DIVISIONS.

The production from these Divisions for the year was very small, amounting to about 280 oz. of placer gold.

George Adams, hydraulicking on Thibert creek, had a small clean-up on account of the immense amount of dead-work involved in removing a great mud-slide which buried his working-pit and some of his equipment. He informed me that this had been disposed of this year and that he was consequently in better shape than ever to go ahead in sluicing and cleaning bed-rock for the next two or three seasons. He is very confident that his returns will be more than satisfactory. Mr. Adams is a "sticker" and a worker and if any one can make a success of this undertaking he will.

George Adsit, on Mosquito creek, took out about 15 oz.; four men sluicing on Dease creek, about 40 oz.; three men on McDame creek, about 20 oz.; Indians on the Tahltan river and various prospectors, about 55 oz.

That interest is beginning to be taken in this extensive country is evidenced by the fact that several prospectors and scouting parties went in this year. No doubt the oil possibilities of the Northern Interior of Canada will mean the prospecting of this north-eastern part of the Province.

No lode-mining of any kind was reported for this year, either on the Stikine river or its tributary, the Iskut. At least one party was up the Iskut this year and they claimed to have traversed a well-mineralized country. Some improvement of navigation will be necessary on this river before there is any possibility of the opening-up of the section.

I reported early in the summer to the Department of Mines that I would be unable to go into these Divisions this season on account of lack of time and was instructed to send in an assistant. J. Frank Breeze, an operator in the Atlin country for several years, was procured for the trip. His report follows:—

Premier Gold Mining Co.—Dock Bunkers looking North.

Premier Gold Mining Co.—Dock Bunkers looking South.

UNIVERSITY OF ILLINOIS LIBRARY

"Pursuant to your instructions to proceed to the Cassiar District and observe and investigate mining operations and conditions there, I left Prince Rupert on July 18th for Wrangel, Alaska, arriving there on the 19th, leaving by the river-boat on July 21st for Telegraph Creek, which was reached on the afternoon of the 23rd. Arrangements were made for horses and other supplies necessary for the trip, and on July 26th we started over the trail for the head of Dease lake, where we arrived on the 30th. There is no mining along this trail, although there is evidence of placer-mining in previous years at different points along the Stikine River benches and on some of the small tributary streams. On the Tahltan river, near its junction with the Stikine, there has been work done by a couple of men this year, but it is of a very casual nature.

"From the head of Dease lake I went by Hudson's Bay scow to Porter, at the foot of the lake. I was delayed here until August 4th by lack of a boat and bad weather. While here, a party headed by H. G. Nicholls, of Vancouver, and consisting of himself, F. Watson, and W. Julian, arrived on their way to investigate petroleum indications observed a little below the junction of the Dease and Liard rivers. On August 4th we left Porter in two boats to proceed down the Dease river to Liard Post, which was reached on August 9th. At Porter I obtained the services of F. Allen, who wanted to make the trip down the river and back, and who also was interested in the oil location. The other party had the services of an Indian, who was very familiar with the river, making four in their boat and three in ours.

"The Dease river is 180 miles in length following its course and has a drop in elevation of 560 feet in its entire length. At the stage of water when we were on the river the current probably averages 4 miles an hour, but in many places in the riffles and rapids it greatly exceeds that. There are some reaches with quite slack water, notably for 10 or 12 miles above McDame creek. There are no places on the river that cannot be safely run by a boatman familiar with river-work, but a knowledge of the river and its bad places is very desirable, and some of the rapids should not be attempted for the first time without first viewing them.

"From Liard Post we went overland to a point about 15 miles south-easterly of the post to the neighbourhood where the indications of oil were said to exist. The country in this vicinity is low-lying and rolling. The general direction of the ridges, which appear to be composed of gravel, is north-easterly and would appear to be arranged by river-flow. There is very little rock outcropping, but sandstone was noticed, also shale, and some rock that has the appearance of being volcanic in origin. Quite a lot of large fragments of lime were also noted, indicating lime formation in the neighbourhood. The gravel observed was the usual river-wash and included considerable sandstone and tuff pebbles as well as granite boulders of some size.

"The formation where the indications of oil was observed, and which had been on fire and had burned continuously for about two years, appeared to be a black carbonaceous shale or impure lignite. The fire was not burning while we were on the ground.

"On August 15th I left the oil territory in company with Walter Julian, F. Allen, and T. Hankin for Liard Post, from there to return up the river. We arrived at the post that afternoon and spent the next day drying blankets and outfit, which had got wet during the continued wet weather of the past week, and preparing for a trip up the river.

"We left Liard Post on August 17th and reached Porter on September 3rd, having been seventeen days on the river, working our way up-stream every day, with the exception of two days that we laid off to dry our bedding and outfit, kept damp throughout the whole trip by the almost constant rain. The continued rains caused high water in the river, covering the beaches and making the river difficult to proceed against.

"It would seem that a reasonable expenditure of work on the Dease river would make it safer and easily navigable for small river-boats of the type now in use on the Stikine river between Wrangel and Telegraph Creek. This work would chiefly consist of shooting out some rocks in the various rapids and the straightening of some of the bends by means of shear-dams. The Hudson's Bay Company send supplies down the river from McDame and Liard Post in scows of 45 feet in length manned by crews of seven men each, loading as much as 12,000 lb. to the trip. The time consumed on the trip is from sixteen to twenty days.

"At Porter, McDame Post, and the Liard Post we saw thriving vegetable-gardens, with potatoes, carrots, beets, radishes, onions, lettuce, etc., all doing very well. At Liard Post, Frank Bass, the post manager, has a very flourishing garden and we had some excellent new potatoes as well as other garden-stuff. The two or three light frosts experienced during the

trip did not do the gardens any apparent harm, and along the valley of the Dease there are long stretches of river-bottom that might return good crops if cultivated.

"Below McDame creek the valley of the Dease widens and the river also gains in size. High cut-banks of gravel, sand, clay, etc., of considerable extent appear and the river's course is interrupted by frequent bars forming sloughs and cut-offs. Farther down-stream the banks become generally lower and the hills are farther back from the river and extensive flats and bars are formed. Any of the bars will apparently give a prospect of fine gold to the pan, and some of the bars cover considerable area, so great that if on prospecting them the values are sufficient and consistent they would make workable propositions for dredging. The gold, while fine, is not flaky, but under a glass appears to be shotty or heavy in character. The depth to the bed-rock, which is generally a shale in this locality, does not appear to be great, as it frequently outcrops along the shore and in the stream-bed, helping to form the numerous riffles encountered in the course of the river.

"*McDame Creek.*—When I visited this creek there was no work being done, the only persons who had been doing anything this year—Wing *et al.*—having discontinued operations for the year, but I am informed that they will resume next spring.

"*Haskin's Mountain.*—This mountain is reached via McDame creek. A number of mineral claims were held on it for some years, but there is no actual development being done. Mr. Brindle, who represents some interested parties, and whom I met at Porter on his way out of the country after spending the summer investigating the properties, expressed himself as being satisfied with the results of his work.

"*Thibert Creek.*—This creek flows into Dease river from the west, just where Dease river flows out of Dease lake. The principal operations are those conducted by George Adams on the property lately held by the Dease Lake Syndicate and established by the late Warburton Pike. The property comprises a number of leases that cover between 3 and 4 miles of the benches of the creek, through which an old channel runs, at an elevation of about 100 feet above the present creek. The rock formation in this neighbourhood is chiefly magnesium rocks and the bed-rock of the pit being worked this summer is largely serpentine. Mr. Adams's work was much hampered and set back by a great slide of overburden that necessitated the removal of his plant and a new set-up. Then he had to pipe away a great deal of the slide to get to the face of the pit, so that it was not until well into August that he had any pit-room or got back to virgin ground to the face. The ground he was working at the time of my visit was prospecting very satisfactorily and Mr. Adams expressed himself as very much pleased with the outlook.

"While the slide, which broke far up the hillside and filled his workings and overran to the creek below, occasioned him considerable delay and expense, he estimates that he will later be benefited by it, for at the present rate of progress, he will have at least two years' work in ground from which the most of the overburden has been removed by the slide, consequently saving him the expense and time required to otherwise move it.

"It is his intention to increase his water-supply by taking water from Thibert creek, which has an ample and unfailing flow. He is now looking into the matter of materials, etc. The transportation question for this undertaking is a serious one at this point, the pack-train being the only means of obtaining supplies or equipment from Telegraph Creek to the head of Dease lake, a distance of 75 miles.

"Mr. Adams has traced the old high channel along the south side of Thibert creek from Berry creek, where his present workings are located, for a distance of about 3 miles down-stream. Thibert creek was pretty thoroughly worked in the early days and the best 'pay' found where the old high channel had been broken down or cut through by smaller streams and the gold from it concentrated in the present creek-bed. There is every reason to believe that the old channel thus contributed to values that made mining profitable on Thibert creek in those early days.

"*Deloire Creek.*—This creek enters Thibert creek from the south, about 3 miles from its mouth, and is a steep creek with a good flow of water. Work was done on this creek this year by the Noonan Bros., but was discontinued early in the summer. They were endeavouring to locate the continuation of the pay-channel that was successfully worked for some years. They sunk a shaft and also operated an Empire drill in an effort to determine the depth to bed-rock to guide them in bringing up a drain that would take care of the flow of water on the ground.

This work is to be resumed in the spring by others who have a working arrangement with the owners. It is a likely location and merits prospecting.

"*Mosquito Creek.*—This is a small creek flowing into Thibert creek from the north, about 13 miles from the mouth. The only work being done is a tunnel that is being driven by George Adsit, who has worked the ground by means of open-cuts for some years, but who is now trying to follow the 'pay' on bed-rock under the present creek-bed. Being immediately under the flow of the present creek, the drift is very wet and he is working at considerable disadvantage. He claims that the ground in the face prospects very well, and some panning that I did while there returned a few grains of nice-looking shot gold.

"*Dease Creek.*—Dease creek enters Dease lake from the west, about 8 miles from the foot of the lake. It has an ample supply of water, maintaining a flow of probably 5,000 miners' inches on a steep grade. The bed of the creek and the lower bars were worked in the early days and considerable drift-mining was carried on in the working of the older river-channel, which follows chiefly the south side of the present creek, at an elevation of about 150 feet above it.

"About 3 miles up the stream from the outlet Tom Ryan is endeavouring to tap the old high channel by means of an open-cut, using a boomer and a hose-line. He is still on the rim-rock, but has some good-looking gravel coming in in the face of the cut. He reports good prospects and hopes to get through to the channel next summer. He is preparing to run a tunnel into the ground this winter at a point where he has good prospects of obtaining fair 'pay.'

"Adjoining him, Philip Hankin is running a tunnel to get into the same channel. His tunnel is still in the rim-rock, but he expects to get through it in another 30 or 40 feet. Three miles farther up the creek and about 6 miles from the mouth, Mr. Johnson is drift-mining and says that he meets with varying success. He had two men employed in the early summer, but is now working alone. This constitutes all the operations on Dease creek at present. The flats at the mouth of the creek were prospected by drilling a few years ago, and, while satisfactory values were said to have been obtained, the work was discontinued on account of the war and has not since been resumed.

"Investigation might prove the old high channel on Dease creek worthy of equipment to work it, for where it was possible to work it by drifting the returns are reported to have been good, and from the amount of work that was done it is evident that the miners met with encouragement."

ATLIN MINING DIVISION.

The placer yield has been practically the same as last year, about $138,500, and may be expected to average about the same for some years to come, unless new diggings are found, as there is little chance of any of the working creeks increasing their present outputs to any extent. Spruce creek with an output of $50,000 and Ruby creek with $47,000 are the leading producers in the Division, and with Pine and Otter creeks, producing about $12,500 each, and Boulder creek, producing $3,600, make up the bulk of the yield for 1921. The event of the season was the finding of a 40-oz. nugget on Ruby creek.

Lode-mining has at last shown some signs of activity, especially in the Rainy Hollow section, where the *Maid of Erin* property is undergoing development.

In the Atlin section also, the Fourth of July creek properties have received some attention this year and deserve more. The *Engineer* mine has still got the most prominent ear-mark of a valuable mine—litigation. It is unfortunate that the progress, not only of the property itself, but probably the whole section, must thus be retarded.

Rainy Hollow Section.

This section is the drainage-basin of the Klehini river, a tributary of the Chilkat river, which flows into Chilkat inlet north-west of Haines, Alaska. The area is reached by way of Haines, a port of call for American boats, but not for the Canadian Pacific Railway boats, which go on through to Skagway, about 15 miles farther. From Haines there is a good motor-road for 24 miles to Wells camp; from there is a fair wagon-road through to the foot of Mineral mountain, on which the mine is situated, a further distance of 32 miles, of which the last 12 miles is in British Columbia.

The Alaska Road Commission expended $40,000 last year and $25,000 this year in rebuilding the road from Haines to Wells, building a bridge across the Chilkat river about a half a mile above Wells, and continuing the road for a mile or two above the bridge. They expect to finish through to Pleasant camp, at the International Boundary, next season. The road from Pleasant camp to the mine had some badly needed repairs made on it this year by Mr. Wiley, who is operating in Rainy Hollow. This portion of the road requires at least $5,000 more spent on it as early next year as possible.

The bridge built by the Alaska Commission above the forks of the Klehini and Chilkat rivers is 900 feet long and has a width of 11 feet between the guard-rails. The bents are 15-foot centres, of four piles each driven 15 feet in the gravel, on which are five stringers for the decking of 4-inch plank. It is certainly a very substantial structure and, as there is practically no driftwood in the Chilkat river, the short spans are not a fault.

The old road was on the south side of the Klehini and had the double disadvantage of being late in clearing of snow in the spring and necessitating recrossing the Klehini below Pleasant camp; however, it served the Porcupine and Glacier Creek placer camps. The new road has been cruised up the north side of the Klehini all the way, practically following the old Dalton trail, and will be a first-class truck-road from the boundary-line to Haines when completed.

The only property which is being developed to any extent is the *Maid of Erin* group, which is under bond to Robert Wiley, of Seattle, and who started work in June, 1920. For a previous description of the property the reader is referred to 1918 Report, page 86.

There are thirteen claims in the group, situated on Mineral mountain, 58 miles from Haines, and owned by Conway, Kennedy & Burnham, of Skagway, Alaska. The owners had done considerable development-work and made some small shipments.

Mineral mountain consists of broad belts of limestone, slate, and sandstone in places metamorphosed to quartzite, the whole apparently underlain by granite, which forms the western border of the sedimentaries and shows a little lower on the hillside. Directly in contact with the granodiorite is a belt of crystalline limestone from 300 to 400 feet wide intruded by spurs from the main granite range.

Along the granite there is a belt of crystalline limestone in which there are several veins roughly paralleling each other and the granite. The most important of these, so far, is about 250 feet east of the granite-limestone contact and consists of a vein of contact-metamorphic type, about 12 feet in width, composed of from 1 to 5 feet of a mixture of solid bornite and chalcocite lying on the limestone foot-wall; the balance of the vein is garnetite, quartz, and some calcite, disseminated with bornite and grading out into the limestone hanging-wall.

The vein dips into the hill away from the granite at about 22°. There are several outcrops below this, indicating other veins and mineralizations of the same type. No work has been done on these showings yet. The granite-limestone contact is at least 400 feet vertically lower than the outcrop of the upper vein, indicating that considerable depth may be expected to the veins.

An incline shaft has been sunk on the main vein, following the limestone foot-wall, a depth of 160 feet (in the middle of July), exposing from 1 to 5 feet of solid bornite and chalcocite all the way down. I understand that the shaft was continued to over 200 feet depth with good ore all the way, though rather broken up at the bottom. Drifts are being run both ways from the bottom of the shaft and are opening up a fine shoot of ore. Mr. Wiley is very pleased with the results of development so far. He was able to get out only 55 tons before winter set in, assaying 25 per cent. copper and 32 oz. silver to the ton. The property has all the appearance of developing a big tonnage of high-grade copper ore. With the amount of milling-ore indicated in the main vein and what may be expected when the lower veins are opened up, it looks as if it would make a big milling proposition. Given good transportation in the shape of a first-class truck-road, this property should make a valuable producer.

Mr. Wiley has attacked the undertaking in a very aggressive manner, and has not only done a lot of prospecting and development work, taken out and sacked several hundred tons of ore ready for shipment, and built a 3-mile tractor-road from the end of the Government road up to the mine, but has also expended a large amount of money on equipment. This consists of two 15-ton Holt caterpillar tractors, each of 120 horse-power, with 4 trailers, one 5-ton, one 3-ton, and two 2-ton capacity; a small Cleveland tractor; a portable air-compressor of 210 cubic feet of air a minute capacity; and two jack-hammers for development-work. In addition, there are two 5-ton Holt caterpillar tractors and five 5-ton trailers on order.

The big tractors and heavy trailers are for use on the road from Haines to Wells or farther as the Alaska road is completed, and will easily handle 40 tons each of freight in and ore out. The 5-ton tractors will be used from the end of the Government road at the foot of the hill as far down as found feasible, to supply the big tractors with ore and, of course, take freight back. The Cleveland tractor is used on the hill for hauling ore from the mine down to the Government road. The portable compressor was taken up to the mine early in the summer and was in operation the balance of the season.

Altogether, Mr. Wiley had invested about $125,000 in the undertaking by the middle of July, and at that time figured on getting out several hundred tons of ore during the fall. He estimates that he can deliver ore from the mine to Haines, 58 miles, for not to exceed $10 a ton with a first-class road.

The opening-up of this property and putting it on a shipping basis means everything to the Rainy Hollow section and for 40 miles beyond, to the Yukon boundary, which is said to be a well-mineralized country, but, of course, inaccessible so far as lode-mining is concerned. Every assistance should be given in putting the road on the British Columbia side in good hauling condition.

Saucier & Goddard, of Haines, have some claims across the Klehini river a few miles from Pleasant camp, on which there is said to be a fair-looking quartz vein, carrying free gold, in massive granite formation. A Mr. Silverman examined the property this summer and appeared well pleased with it.

Atlin Section.

Big Horn Group.

This group consists of six mineral claims—*Big Horn*, *Little Bear*, *Gold Bird*, *Lucky Jack*, *Tyee*, and *Bertha*—owned by Fred Lawson and associates. The claims are situated up Big Horn creek, about 10 miles by trail from Taku arm of Tagish lake. Mr. Lawson's cabin is on the west side of the arm just opposite Golden Gate. The *Engineer* mine is a few miles farther down the lake and on the opposite side. The trail from Lawson's cabin skirts around the lake to Otter creek, which it follows up about 3 miles to Big Horn creek, which empties into Otter. It then follows up Big Horn creek to the camp at the property. The camp is at an elevation 2,550 feet, or only 400 feet above the lake, and the trail therefore has little grade and could be converted into a wagon-road at comparatively small expense.

The showing on the claims is a small flat quartz vein occupying a shear-zone in hornblende-schist formation overlying a gneissoid granite. The shear is about 2 feet wide and filled with ground-up schist, in which the fissure-filling of quartz is from a few inches up to the full 2 feet in width. The quartz carries small amounts of pyrite, galena, and native gold.

At 3,390 feet elevation a tunnel has been driven on the vein for about 50 feet. At the face the vein is about 6 inches wide and looks as if it were turning down on a dip of about 30°. A sample at the face gave low values in gold and silver. About 40 feet north of this another tunnel has been driven about 54 feet, following the vein for about 6 feet, when it cut out, but again appeared about 10 feet back from the face. Older barren veins of quartz are also found in the shear-zone. The quartz lens on which the tunnels have been driven appears to pinch out just north of the last tunnel. There is about 50 tons of ore on the dump from these two tunnels ready to be taken down to the mill at the cabin. The vein can be followed along the face of the bluff for 200 feet south of the first tunnel. It has been open-cut for about 100 feet of that distance, from which some fine ore was taken. A grab sample of the broken ore along the cut gave 23.9 oz. gold and 3 oz. silver to the ton. This is the largest quartz lens seen on the claim, though there are many small ones, bunches and blocks, in the broken-up distorted schistose-rock formation.

A light-coloured quartz or granite-porphyry dyke striking N. 10° W. (mag.) was followed from the quartz vein to the top of the hill, at 5,425 feet elevation. In this several lenses of quartz were noted, paralleling the strike of the dyke, but as no work had been done on any of them no samples were taken. Values of $18 a ton are said to have been obtained on the croppings.

Mr. Lawson has rigged up a tramway with a heavy wire from the tunnel levels to the foot of the hill. Ore is let down in a single bucket with a light cable running on a braked windlass, used for pulling the bucket back. The mill consists of a sample crusher and one stamp operated by an overshot water-wheel. No ore is sent down the hill that does not show free

gold, the feed assaying up to 14 oz. gold to the ton and the sulphide concentrates running up to 90 oz. gold to the ton. A grab sample from a small dump at the camp that has been sorted over several times gave $14 a ton in gold.

The showings on the property are too limited to warrant any large operations, but three or four men might make the lens pay, the work on which is being done.

Spokane Group.

This group consists of three claims—*Spokane*, owned by Mrs. A. Lawson; *Mohawk*, by Horace Fraser; and *Edwin*, by Jules Eggert, of Atlin, B.C.—and is situated about a mile north of the *Big Horn* group. Considerable work has been done on the property, consisting of three tunnels. The highest, at 4,275 feet elevation, is in about 12 feet, with a 15-foot open-cut at the collar. The work shows a 2-foot vein of quartz, sparingly mineralized with disseminated iron sulphides, lying in a schistose country-rock. The vein strikes S. 60° W. (mag.) into the hill and stands about perpendicularly. A grab sample taken from about 20 tons of quartz on the dump gave returns of 0.76 oz. gold and 0.4 oz. silver to the ton.

The next tunnel, called the "blacksmith tunnel," is at 3,750 feet elevation. It was driven 30 feet to the vein and the vein crosscut, showing a width of 10 feet of quartz slightly mineralized with grains of marcasite. At 3,375 feet elevation the vein again crops, showing 4 feet of quartz. A tunnel was driven here for a distance of 125 feet, but bears away from the vein. The mouth of the tunnel had caved and was therefore impossible to get into it, but I suppose the idea was to drive alongside the vein in the softer country-rock. Altogether, this is a rather promising-looking vein. It is very persistent and if the quartz averaged from $15 to $20 a ton it would make a profitable little property.

Big Canyon and Ruffner Groups.

(*See* accompanying sketch.) These two groups include altogether twenty-five mineral claims, twelve in the *Big Canyon* group and thirteen in the *Ruffner* group. The former is under option to Mr. Ruffner, of Atlin, B.C., who staked the balance of the ground contained in the *Ruffner* group. The claims are situated on Vaughan mountain, about 10 miles up Fourth of July creek from Atlin lake. From Atlin it is about 14 miles by wagon-road, the first 6 miles of which is in good repair; the last 8 miles, up the creek, is in fair condition, but has not had sufficient work on it to make a good road. Transportation, however, would not present any serious difficulties, for an easy-grade motor-truck road could be built from the lake to the foot of the hill, on which the claims lie, at a comparatively small cost. There is a fine bottom for a road, no rock-work, and very little grading would be needed if the road route were carefully selected. The difference in elevation between Atlin lake and the foot of the hill, 10 miles, is about 1,000 feet, and from the foot of the hill to the present camp is about 750 feet. The valley is well timbered and I judge that plenty of water-power could be developed in Fourth of July creek.

The prevailing rock formation of Vaughan mountain is light-coloured coarse-grained granite. This has been intruded by many dark-green andesitic dykes which have followed a roughly parallel series of fractures in the granite, striking N. 30° to 50° E. and dipping at a high angle to the north-west. The dykes have evidently also formed lines of weakness, for they have been intensely sheared and crushed by subsequent movements. Mineral-bearing solutions following along these shear-zones have filled the fissures, replaced the crushed dyke-rock to a great extent, and cemented the rock fragments with quartz, calcite, and the metallic minerals, arsenopyrite, zinc-blende, galena, pyrite, and chalcopyrite, in importance of probably the order named. The veins are therefore mineralized dykes.

Owing to the loose ground-up nature of the vein-filling intense weathering and oxidization have taken place, and the surface showings are consequently nothing more than residual limonite and sand, with ribs of mineralized quartz in it. This surface oxidization has penetrated to such a depth that none of the surface work yet done on the showings has got into the solid vein-filling beneath.

On the lower claims, or the *Big Canyon* group, two big veins or mineralized dykes crop very prominently and considerable work has been done on them. The upper of these veins, called the No. 7, cuts across Crater creek, about 300 feet south of the forks of Crater and Vulcan creeks. The canyon exposes it to considerable depth, showing it to be from 25 to 30 feet wide and striking N. 50° E. (mag.) The hanging-wall portion of the vein for a width of 8 or 10 feet is brecciated quartz and dyke-rock, very slightly mineralized and gradually becoming

more quartzose toward the centre of the vein. The central part is the best mineralized, while the foot-wall is practically straight dyke-rock. At an elevation of 3,900 feet a tunnel has been driven 170 feet, following the ore, which occurs in parallel bands, bunches, and small veinlets. At about 100 feet in the tunnel a lens of ore about 6 feet wide and lying about the centre of the dyke was followed for about 30 feet, where it cut off abruptly, probably thrown to either of the walls. Several tons of ore from the tunnel and an open-cut above was sorted and sacked, samples of which averaged about 27 per cent. lead and 50 oz. silver to the ton. The silver values vary from 1 to 3 oz. a unit of lead; samples of galena assaying 50 per cent. lead run as high as 140 oz. silver and $16 in gold to the ton. A conservative independent sampling of the tunnel gave an average of 11.4 oz. silver to the ton across 6 feet for a length of 70 feet. A tunnel was driven 70 feet on the same vein on the opposite side of the creek, showing about the same conditions.

The lower of these two veins, No. 6, lies just below the forks of Crater creek, follows the north bank of Vulcan creek for several hundred feet before crossing to the south side, and is believed to again crop on the *Maumee* claim, 3,000 feet farther up the hill. The work on the lower end of this vein consists of a shaft 10 feet deep and a couple of shallow open-cuts, exposing an intensely oxidized vein from 8 to 12 feet in width. It strikes N. 40° E. (mag.) and dips about 70° to the north-west. The elevation of the shaft and cuts is about 4,000 feet. This dyke is not as wide as the upper one, but the whole is mineralized between the granite walls, giving it more the appearance of a fissure-vein. Two samplings of the shaft gave an average of 15 oz. silver to the ton across 6 feet. The gold values are small, running up to $4 a ton. This is a strong, well-defined vein, traceable for two claim-lengths, carrying fair values in the surface oxides, and is certainly worth gaining sufficient depth to prove it below the zone of oxidization.

Farther up the hill at an elevation of 4,600 feet, on the *Maumee* claim, what appears to be the continuation of the No. 6 claim has been exposed by a shaft about 10 feet deep. An average of different, reliable samplings of the shaft and adjacent open-cuts indicate a value of about 15 oz. silver to the ton for a width of about 5 feet. The vein strikes N. 40° E. (mag.) and stands almost perpendicularly. It is 6 feet wide, between solid granite walls, and composed of siliceous dyke-rock mineralized with arsenopyrite, zinc-blende, and galena.

From this shaft north across the face of the mountain four other veins have been found in a distance of about 3,500 feet, having the same appearance and characteristics as the two already mentioned. No. 5 vein is indicated on the surface, but no work has been done on it yet.

On No. 4 vein, at an elevation of 4,975 feet, an open-cut and tunnel of about 40 feet, shown on the sketch as 4A, expose a vein about 8 feet wide at the portal of the tunnel, where it is intensely oxidized. The face of the tunnel is becoming a little more solid, ribs of mineralized quartz appearing. A sample across 4 feet at the face gave assays of $1.60 gold, 27.2 oz. silver, and 6.5 per cent. lead. Another open-cut, 4B, 200 feet farther east on this vein and at 5,500 feet elevation, shows from 4 to 6 feet of oxidized material. In this is a vein of about a foot of good ore. A sample across 8 inches of it gave 43.2 oz. silver and 2.1 per cent. lead to the ton. The oxides assay between 3 and 4 oz. silver to the ton. Another sampling of cut 4B gave an average for five samples of $3.95 gold and 16.1 oz. silver to the ton across 3 feet. There is another cut higher up on the same vein, proving it for a length of over 4,000 feet. The clean galena in this vein assays well in silver, 42 per cent. lead carrying 162 oz. silver, suggesting grey-copper or silver sulphides, though none were noted. Though depth will be gained very slowly for a way in driving the tunnel at showing 4A, I think the values found in the solid sulphides fully warrant the continuation of this tunnel far enough to get in beyond the oxidization.

Some 1,500 feet north of this is No. 3 vein. The only work done on it is one open-cut, showing a foot of ore in the bottom of the cut, assaying 30.4 oz. silver to the ton.

Still farther north, No. 2 vein has been exposed in several places and demonstrated to extend for a length of at least three claims, or 4,500 feet. One of the open-cuts, 2C, at an elevation 5,575 feet, has been driven on the vein about 25 feet and shows it to be at least 14 feet in width, and consists of soft oxidized material in which are found chunks and badly decomposed seams of solid coarse-grained galena. The clean galena is said to assay over 200 oz. silver to the ton. Down the hill from this, another cut, 2B, assayed $1.20 gold and 50.8 oz. silver to the ton across 24 inches of ore. No. 2 is one of the best-looking veins on the property.

It can be seen following a depression from the top of the mountain to below showing 2B, from which point the ground flattens out to a point below the pond and showing 2A, where it again breaks off abruptly and the vein is distinctly marked by a deep ravine to the bottom of the hill. The point, being at a low elevation, would be a very advantageous place from which to attack the property for extensive operations. By driving a short crosscut tunnel to No. 2 vein and drifting on it, crosscuts could then be driven to intersect the other veins at great depth.

However, there is a great deal of surface development-work to be done before deep development is attempted. The property is seriously handicapped in having such a depth of oxidization on the surface of the veins, but, taking everything into consideration—the number of veins already found, their widths and continuity, and their surface values—I think there is every chance of developing at depth a tonnage of commercial ore that will make this a valuable property. Judging from the values in the sulphides found in the surface, it is certain that the galena will pay to ship, and it may prove that a concentrate of all the sulphides will be of shipping grade.

In my opinion, the property fully warrants the expenditures necessary to drift on the No. 2 and No. 4 veins a sufficient distance to penetrate the zone of oxidization and demonstrate the extent and values of the sulphides in the solid gangue.

Ruby Creek.

This creek was first worked by hydraulicking in 1912, since which time it has probably been the best paying of the smaller creeks in the Atlin district. Records extending over that time show that the gravel has averaged over $1 a yard and bed-rock from $1 to $2 to the square foot. Up to and including 1920, approximately $400,000 has been taken out of this creek by the one operating company. The yearly clean-up has ranged from $30,000 to $80,000 in that time, and about three-quarters of a mile of bed-rock, averaging about 200 feet in width, has been cleaned. A nugget valued at over $700 was found this year.

The company in working up the creek encountered lava along the rim in several places, the flow over the creek-bed evidently having been so thin that it was broken up and carried out with the high water. This basalt flow did not interfere with operations until the fall of 1918, and in the following year it was found necessary to move the plant farther up the creek. I judge that the company has now about 1,000 feet of open creek to the heavy lava-bed above and the limit of its ground. Above the company ground 1,500 feet is held by Roxborough, of Atlin; then 500 feet by the company; then 200 feet by Colbourne; then a mile by Chas. Miller, a mile by Krumbeigle, and above that by various owners.

I see no reason for drawing any other conclusion than that the pay-streak, so thoroughly proven down the creek, continues on up the old channel, which no doubt formed a natural channel for the lava-flow. Judging by the amount of gold that has been taken from the creek below, drift-mining under the lava on the same channel should be profitable if mining conditions are favourable. At any rate, it is well worth investigating, for I am informed that the old channel has never been prospected here. A shaft was pointed out to me on the bank of the present creek and along the edge of the lava-flow which was claimed to be down 20 feet and to have struck encouraging values on the rim of the old creek-bed.

It would not be a very expensive undertaking to sink a shaft to the rim and from there an incline to bed-rock under the lava, from which point drifting operations could be carried on. Pumping might be expensive for a time, but would be dispensed with when the drift on bed-rock had reached the elevation of the top of the shaft.

At the time I was on the creek this summer, July 8th, Krumbeigle and partners were sinking a shaft on their lease trying to penetrate the lava. The shaft was down 40 feet then and still in the solid basalt when work was suspended this fall.

Boulder Creek.

The upper leases on Boulder creek are held by Chicago interests, with Mr. Gore in charge of operations. The great handicap on this creek has always been the lack of water. This year a new dam 150 feet long was built across the creek at an elevation of 4,100 feet. This forms a reservoir which when full will operate two giants about three hours, against twenty minutes

for one giant before. The pressure-box is about half-way between the dam and the pit, from which there is a pipe-line from 40 inches at the box to 12 inches at the machine, with a head of 120 feet. A pipe-line from the dam to the pit would give a 200-foot head. A clean-up was made from a small pit while I was there, yielding $1,000. Considerable dead-work has been done since that time in preparation for further operations.

Otter Creek.

The Mines d'Otter Creek, under the management of Henri Maluin, has been operating on this creek for several years, sluicing out in that time a channel probably a mile long, from Surprise lake to the present face. In all this work there has been no "pay" to amount to anything, with the exception of a couple of small flat benches high up on rim-rock which gave good returns. No bed-rock has ever been found. This year's operations have been the most encouraging so far, and it looks as if the rims were converging and consequently some chance of reaching bed-rock. In addition to this, "pay" was found on the right-hand side of the creek, looking up, on a higher rim, which increased the season's yield and gives promise of further "pay," as well as better results expected on bed-rock in the near future.

Mr. Maluin and the company he represents are certainly "stayers" and are deserving of every success.

O'Donnel Creek.

There has been no production from this creek to amount to anything for the past several years. This year there were three men working at different places on the north banks, trying to get under a deposit of blue clay, under which the old workings had good "pay." It looks as if there had been a slide, or a deposit, of blue clay over an old channel, but whether the clay has crowded the gravel out of the old channel entirely and over the rim of the present channel, or whether the clay has simply covered the gravel in the old channel, is the information wanted.

See J. A. Fraser's report on the Atlin Division following this report.

In concluding this report, I wish to express my appreciation of the courtesy and assistance of the prospectors and operators throughout the district.

CASSIAR DISTRICT.

ATLIN MINING DIVISION.

REPORT BY J. A. FRASER, GOLD COMMISSIONER.

I have the honour to submit my report on mining operations in the Atlin Mining Division of Cassiar District for the year ending December 31st, 1921.

I regret having to report another season of limited operations and output; this was due to the small number of men engaged in actual mining, the large percentage of whom were engaged in prospecting new ground or in doing dead-work of a prospecting nature.

There was a smaller number of people in the district this year (not counting tourists) than ever before, and of those who were here not more than 130 were engaged in placer-mining at any time, and of those at least twenty were prospecting new ground in one form or other.

Not more than forty men were engaged at any time in quartz-mining, and of those from twelve to fifteen were prospecting and doing assessment-work.

I have not been able to secure as full returns of output as in former years, but, while apparently there was a little less output than in 1920, the amount *per capita* is quite up to that of last year, and the revenue collected will be about the same or possibly a little more.

The output on Ruby and Otter creeks exceeded that of last year; that on Spruce creek was about the same, but the production on the other creeks was less.

Taking the creeks in the same order as for some years past, I may say that on McKee creek the prospecting operations initiated a year ago by the Delta Gold Mines Company have been carried on throughout this year, but only on a small scale. They are still in progress. The company has located some more leases adjacent to those already held, which seems to indicate the intention of activity in the near future, but as the company's executive lives in Pittsburgh, Pa., I have not learned as yet just what is contemplated, or when.

On Pine creek from ten to fifteen men operated throughout the season from May to the end of October, with very fair returns in most cases for the time actually employed in mining. A few men are drifting on this creek this winter.

On Spruce creek from thirty-five to forty-five men were operating throughout the season and a number are drift-mining there this winter. From eight to twelve of the above number were prospecting during the greater part of the season, but those who were sluicing recovered in most cases very good returns. This was still the banner creek from the standpoint of production, having supplied about $50,000 of the total output of the camp.

On Birch creek a small force operated for a portion of the season with rather indifferent success, but next season will find them at work again.

On Boulder creek from eight to twelve men operated from May to October 4th, when operations were suspended for the season. A considerable portion of the time above mentioned was spent in working through comparatively barren ground to reach much more promising ground farther back from the creek, where next season's operations are expected to compensate for the dead-work done this year. Owing to an unfortunate condition created by the spring freshet the operators on the lower portions of the creek did practically no mining throughout the season.

On Ruby creek the Placer Gold Mines Company, under the joint management of C. E. Leonard and C. H. Titus, commenced operation on April 24th and continued until October 14th, during which period they advanced up-stream over 400 feet, with an average width of 160 feet, and moved about 45,000 cubic yards of gravel, from which they recovered about double the output of 1920 and incidentally secured a handsome profit upon the season's operations. The company had been doing more or less dead-work for two seasons past and is now realizing the benefit thereof. A force of about twelve men was employed throughout the season. This company suffered a sad loss through the death last winter of Theo M. Daulton, who installed the plant of this company and had been its manager since its formation. The camp is also the loser through the passing of this genial and highly esteemed gentleman from the ranks of the operators therein.

A number of men were prospecting on the higher reaches of this creek throughout the summer and from eight to ten are "drifting" there this winter.

On Wright creek four or five men were mining throughout the season, but I regret to say I have not had any report as to the amount of work done or as to results therefrom.

On lower Otter creek the Mines d'Otter, under the superintendence of Henri Maluin, with J. E. Moran as foreman, commenced operations on April 25th and continued until the end of October, during which period they advanced their sluices up-stream about 250 feet and moved about 200,000 cubic yards of material, but have not yet reached bed-rock, for which they are searching. This season's operations uncovered about 40,000 square feet of a hard-pan bed-rock, such as has been described in previous reports, but no satisfactory amount of gold was found thereon. Near the close of the season, however, a discovery of a stratum or deposit of really good pay-gravel on a somewhat high rim increased the season's output very materially, exceeding last year's output by from 20 to 25 per cent., and encouraging the belief that good "pay" may be recovered from rather high levels in the benches, as well as from bed-rock when they reach it. A few men are drift-mining there this winter.

On Lincoln creek no work has been reported, and so far as I know nothing has been done on this creek this year.

On Davenport creek prospecting was undertaken last winter by driving a tunnel beside and under the creek. This tunnel has been already driven several hundred feet under the creek without encountering bed-rock, but, according to the latest report received, the indications were very promising and the work is still in progress.

On Wilson creek only one or two men did anything this year, and they were prospecting.

On Feather creek two men spent most of the season prospecting, and two or three others did likewise on Slate creek, but I have not received reports from any of them.

On O'Donnel river a number of men were operating and prospecting part of the season, and at one point work of this character which was commenced nearly two years ago is still being prosecuted, but I have had no reports.

Nothing has been reported with respect to development upon Bull, Burdette, Cracker, Fox, Graham, Granite, Hemlock, Horse, Silver, Union, or Volcanic creeks during the past season, although more or less prospecting has been done on most of them.

A considerable number of the leases with respect to which arrears were consolidated last year have been allowed to lapse because the holders were unable to operate them, but nearly as many new leases have been located and are awaiting survey before being issued. It is expected such surveys will be made and the leases issued next season.

MINERAL CLAIMS.

Still another year has passed during which apparently very little has been done in the way of developing quartz properties throughout the district, apart from what was necessary to protect title.

With respect to the silver, lead, gold, and copper properties mentioned in last year's report as being situated in the vicinity of Crater creek, near Fourth of July creek, I may say that the holder of the greater portion of these properties succeeded last spring in interesting certain capitalists in the properties to the extent of sending an engineer in to look them over and do some prospecting-work, but after a few weeks' sampling-work of an apparently perfunctory nature this work was abandoned and the engineer transferred to another field of operation. The properties have since been examined by another engineer, one who has had much experience in noted mining camps where very similar conditions and formations predominated, and he has expressed himself as being very favourably impressed with what he saw, and consequently there is good reason to expect that active development will be undertaken there in the near future.

In the Rainy Hollow section of this district R. W. Wiley had a considerable force of men employed on or about the development of the *Maid-of-Erin* copper property between June and November, but owing to the condition of the wagon-road between the mine and Wells, a distance of about 30 miles, of which 12 miles are in this Province and the balance in Alaska, he was unable to prosecute development satisfactorily, and, in fact, claims to have employed a considerable portion of his force in road-making in order to enable him to transport ore out or supplies in to the mine. I have not had any report from him as to his season's operations, but I have reason to believe he had several hundred tons of bornite ore sacked ready for shipment, and that he succeeded in getting a considerable quantity of it to tide-water at Haines (Alaska),

whence some 55 tons was shipped to the Tacoma smelter. Such reports as I have been able to secure agree in stating that the mine at a depth of over 100 feet is showing up excellently.

With respect to the *Engineer* mine, I need only say that the title and ownership is the subject-matter of pending litigation and that all development is at a standstill.

As to other quartz properties throughout this portion of the district, I may say that the owners are "marking time" awaiting the outcome of the litigation with respect to the *Engineer* mine, and not much, if any, active development is likely to be undertaken until that is settled.

Nothing has been done in the way of developing the coal or hydromagnesite deposits in this district since last report.

STIKINE AND LIARD MINING DIVISIONS.

REPORT BY H. W. DODD, GOLD COMMISSIONER.

I have the honour to submit herewith the annual report on mining operations in the Stikine and Liard Mining Divisions of Cassiar for the year ending December 31st, 1921.

Five new placer leases were issued during the year and the holders of mineral claims kept their assessments up.

As the report of the Resident Engineer will cover all developments during the season, I will have nothing more to add.

OFFICE STATISTICS—LIARD AND STIKINE MINING DIVISIONS.

Revenue collected from free miners' certificates	$ 492 00
Revenue collected from mining receipts	1,393 30
Revenue collected from other sources	5,008 34
Total	$6,893 64

SKEENA DISTRICT.

SKEENA AND BELLA COOLA MINING DIVISIONS.

REPORT BY J. H. McMULLIN, GOLD COMMISSIONER.

I have the honour to forward you herewith the office statistics of the Skeena and Bella Coola Mining Divisions for the year 1921.

The report of the Resident Mining Engineer fully covers the mining development for the year and I have nothing further to add to his report.

OFFICE STATISTICS—SKEENA AND BELLA COOLA MINING DIVISIONS.

QUEEN CHARLOTTE MINING DIVISION.

REPORT BY J. L. BARGE, MINING RECORDER.

I have the honour herewith to submit my annual report for the Queen Charlotte Mining Division for the year ending December 31st, 1921.

Copper Island.—Work on this property has been steadily carried on by A. Heino in a small way with very good results. It is reported that Mr. Heino has bonded his iron properties to a Vancouver syndicate.

Ikeda Mines, Ltd.—Work on this property has been in abeyance during the past year, a watchman only being maintained.

Jedway.—The *Thunder* group at Collison bay has been bonded and deals for two other properties are pending, which indicates renewed activity in this part of the Division in the early spring. Campbell & Wild have done considerable work on the *Mother Lode* and *Bank of Commerce* claims and showing up a good body of ore.

Shuttle Island.—The *Ellen* group, taken over by a Vancouver syndicate during the summer, has not been actively developed; operations are in abeyance until a final settlement is reached.

Louise Island.—The *Iron Duke* group and adjacent iron claims have had the usual assessment-work done, as well as having been surveyed, and certificate of improvements have been applied for; while opposite Louise Island, in Cumshewa inlet, preparations are being made to resume work on the *Go East* and *Homestake* groups.

South Easter mines have not been operated this year.

Blue Mule Group.—Jones, McRae & Wiggs have uncovered some very good ore in Kootenay harbour. J. H. Jones and Nels Larsen have the property leased for a term of three years and are actively engaged in development.

Gold Harbour.—T. R. Davey and Nils Persen leased the *Early Bird* group for a short term from J. McLellan and have produced very fair returns.

Black Sands.—On the east and north coast of Graham island considerable staking of the beach sands as placer leases has been in progress. Fourteen leases have been issued and four others applied for, and thorough preparations have been made for an early start on productive work early in 1922.

OFFICE STATISTICS—QUEEN CHARLOTTE MINING DIVISION.

Free miners' certificates issued	59
Mining claims recorded (quartz)	27
Mining claims recorded (placer)	4
Placer leases issued (hydraulic)	14
Placer leases applied for (hydraulic)	4

Marriage licences	10 00
Poll-tax	10 00
Total	$1,678 75

NORTH-EASTERN DISTRICT (No. 2).

REPORT OF JOHN D. GALLOWAY, RESIDENT ENGINEER.

GENERAL REMARKS.

The North-eastern Mineral Survey District consists of Omineca, Cariboo, Quesnel, and Peace River Mining Divisions, and occupies a large portion of Northern British Columbia, having an area of nearly 100,000 square miles. The northern, western, and southern boundaries of this district are the arbitrary boundary-lines of the Mining Divisions, but these, where practicable, always follow the watersheds of the country. The eastern boundary is the British Columbia-Alberta boundary-line. The western boundary is roughly 100 miles from the Coast, while the northern and southern boundaries are about 200 miles from the respective Provincial boundaries.

For descriptive purposes in this report the district is reviewed under the main headings of the Mining Divisions, subdivided into sections as follows:—

Omineca Division—Skeena section; Hazelton section; Telkwa section; Babine section; Fraser Lake section; Manson section.

Cariboo Division—Fort George section; Vanderhoof section; Barkerville section; Cottonwood section.

Quesnel Division—Quesnel River section; Horsefly section; Keithley section.

Peace River Division.

A general description of the geographic, geologic, and topographic features of the district was given in the Annual Report of the Minister of Mines for 1917. In the following table is given a list of the more important reports on this district, in addition to which numerous references can be found in the Summary Reports of the Geological Survey and the Annual Reports of the British Columbia Department of Mines:—

SUMMARY OF MINING ACTIVITY.

In a consideration of the mining activity in the North-eastern District during 1921, it should be remembered that the year was a most depressing one for the mineral industry throughout the American continent. Low metal prices and an oversupply of almost all metals caused drastic curtailment of production everywhere. Furthermore, the financial conditions were such as to make it a most unfavourable year in which to expect an influx of capital for the acquirement of new mineral properties.

Considering these adverse influences which prevailed, the condition of the mining industry in the North-eastern District during the past year was better than might have been expected. While but little lode-mineral production was made, a substantial increase in the placer-gold output as compared with 1920 is an encouraging sign for the future. With a return to normal market conditions for the different metals, a resumption of lode-mineral shipments from the district will probably soon take place.

Development of mineral properties was proceeded with in many parts of the district and more prospectors were in the hills than for some years past. Besides the actual exploratory work of looking for new mineral discoveries, much work is done in the course of a season by prospectors on the properties that they own. In quite a number of instances of work of this nature done this summer the showings of ore have been improved and the general results obtained were satisfactory. There are now in the North-eastern District a considerable number of prospects carrying a great variety of ore and metals which should prove attractive to those who are looking for prospects that have some chance of developing into profitable mines.

Placer-mining was vigorously prosecuted in the Cariboo and the indications are that the yearly placer-gold production of that section will soon again increase to equal that of pre-war years. Particularly interesting is the reopening of the old *Bullion* mine at Quesnel Forks, which property was at one time the most important hydraulic mine in British Columbia.

The *Silver Standard* mine and concentrating-mill at Hazelton was closed all year; operations are to be resumed in January, 1922. The condition of the mine is satisfactory and the reason for closing down near the end of 1920 was owing to the difficulty of marketing silver-lead and silver-zinc concentrates.

The development of a very promising coal property on the Telkwa river was commenced during the year. This property, known as the *Betty* mine, has a thick seam of good-grade coal which will prove highly satisfactory as a steam-coal or as domestic fuel. The operations at the mine are as yet on a small scale, but once the high quality of this coal is known it will command a good market. The opening-up of a source of a steady supply of good coal will undoubtedly assist the growth and prosperity of Northern British Columbia.

So far as is known, the only ore shipments made this year were a car-load of concentrates from the *Silver Standard* (clean-up of mill-bins), a small shipment of gold ore from the *Hazelton View*, and a few tons as test shipments from different properties. The production of placer gold was $70,000, as compared with $69,000 in 1920. The coal shipments from the *Betty* mine amounted to 800 tons.

PLACER-MINING.

Mining in the North-eastern District commenced many years ago with the working in the sixties of the bonanza placer-gold fields of the Cariboo. Since that time placer-mining has been continuously carried on in the Cariboo, but, as might be expected, the yearly production has declined considerably from that of the early years. During the war years the production of placer gold still further declined, but it is apparent that an upward trend has now started, as the production is greater for 1921 than for the preceding year, and the plans now under way will undoubtedly result in a largely increased production in the future.

The easily available, rich diggings of the Cariboo District are apparently for the most part worked out, but this is a generalization which may have many exceptions, as was shown this year by the discovery of rich ground on Cedar creek, in the Quesnel Forks section. Further exploration is continually being directed in the hope of finding continuations of the old rich "leads," or portions of the leads that were overlooked by the old-timers, and a certain percentage of successes always rewards these fresh efforts. It will be seen, therefore, that the Cariboo District still has possibilities for the prospector and the small mining syndicate.

The greatest resource of placer gold in the Cariboo District, however, is in the low-grade gravels, which must be worked on a large scale by hydraulicking, dredging, or deep-drifting methods with adequate machinery. Placer-mining of this nature calls first of all for thorough testing of the ground to determine the average values; and, secondly, for plenty of capital so that the property can be properly equipped.

Besides the operating properties, there are at the present time in the Cariboo District a number of companies engaged in prospecting or equipping properties for such large-scale placer-mining. And there is still much ground left that at least warrants preliminary testing to see if it will not pay to work by dredging or other methods.

There are several reasons why placer-mining in the Cariboo District should experience a renewed impetus in the near future. In the first place, the adverse conditions of high costs without increased value of his product which militated against the gold-miner during the war years have practically disappeared. Wages and all costs are practically back to those of pre-war years. Secondly, the completion of the Pacific Great Eastern Railway into Quesnel has materially lessened freighting costs into the Cariboo. Formerly it was necessary to haul machinery and equipment from Ashcroft by wagon or motor-truck, with the result that in many cases the freight was higher than the first cost of the article. At the present time Barkerville is only 60 miles by motor-road from the railway at Quesnel, as compared with 280 miles from Ashcroft. And Barkerville is about the farthest point in the district from the railway, there being much promising placer-ground on the Fraser, Cottonwood, and other rivers and creeks only a few miles from the railway.

Another placer-gold field in the North-eastern District which attracted considerable attention at one time is what was known as the "Omineca"; this consists of the Manson and Ingenika sections of the Omineca Mining Division. Certain rich creeks in these sections were worked many years ago and intermittent mining was carried on until recent years. With the decline of gold-mining during the war years and the lack of prospectors in the hills, the district was virtually abandoned and now there is but a small production from it.

There is in this part of the Omineca Mining Division a very large area still to be thoroughly prospected for placer gold. The country lying at the headwaters of the Skeena, Stikine, and Finlay rivers should yet yield some rich placer-gold creeks, and it would not be surprising if the next placer stampede was to this section. Around the old placer-workings of the Manson and Ingenika sections there is undoubtedly much low-grade ground which would pay to work by modern methods, but the handicap of lack of transportation has so far prevented much development of this nature. At the present time the means of access to these sections is by pack-trail from Hazelton or from Fort St. James, and the distance from the railway is over 200 miles. It is obvious, therefore, that only the richest of the placer-gravels could be worked with any chance of success. The field, however, is a promising one for testing the possibilities for large-scale hydraulicking and dredging, as, if sufficient pay-ground was found, the transportation could be materially improved by the construction of a wagon-road.

LODE-MINING.

Active lode-mining in the North-eastern District has been mainly confined to the territory contiguous to the Grand Trunk Pacific Railway. While this railway was being constructed much prospecting was carried on in the Skeena, Hazelton, and Telkwa sections of the Omineca Mining Division. The railway was finally completed in 1914 and about that time the first ore shipments were made. Since that time lode-mining has gradually progressed in the district, but not quite as rapidly as had been hoped. It should, however, be remembered that the development of new mines is a slow process, especially in a country where lack of transportation is a great handicap. There are undoubtedly many prospects in this district which will repay systematic exploration, but it is a difficult matter to interest capital. In a few cases the owner of the property asks a higher purchase price than apparently any one is willing to pay, while in others the transportation problem is a difficult one to solve. During the year 1921 this district, in common with every mining district in North America, suffered more or less from the depression in mining. The great necessity for this district is to interest capital in developing the properties which are now lying dormant, and this year has been an unfavourable one for the inception of new mining business of any magnitude. A few examining engineers went through the district, but they did little in the way of acquiring property. There is

every reason, however, to expect much more activity during 1922. The *Silver Standard* mine at Hazelton, which has been closed for a year, is to be reopened in January, 1922. A number of "deals" are pending and generally the prospects for the coming year are quite bright.

PROSPECTING POSSIBILITIES.

The general statement that Northern British Columbia has vast areas of virgin ground for the prospector has been repeated many times, but it seems advisable to elaborate somewhat on the idea. In the years immediately prior to the completion of the Grand Trunk Railway there was a rush of prospectors to the mountains bordering the Skeena and Bulkley rivers and their tributaries. The country was "run over," but undoubtedly much of it was not thoroughly prospected and many spots, especially if a little distance from the main trails, were never looked at. A certain number of these prospectors staked claims and to some extent at least settled down on them to make them into mines. In certain cases the prospects justified holding and development, but in many others good prospectors were tied down to the development of property which never could prove of value. The great majority of the prospectors who first came into the country soon left it for other fields, as the true prospector is a wanderer. Since the first rush of prospectors but few others have come into the country, and in recent years prospecting in the district has been carried on practically entirely by those prospectors from the first rush who stayed in the country to hold property. While many of these men are good prospectors, their main objective is not prospecting, but the selling of the various claims they have held for years, and, furthermore, as a rule their prospecting is confined to the immediate vicinity of their holdings. What the country needs is a fresh influx of prospectors who will prospect anywhere in the district and not confine their activities to certain areas.

Outline of Promising Sections.

It will be well to analyse in some detail the district with a view to pointing out to prospectors favourable places to prospect. It has been frequently mentioned that the eastern contact-zone of the Coast mountains is in many places well mineralized. Inasmuch as these mountains extend as a series of mountain ranges from the southern boundary of British Columbia to Alaska, the eastern contact-zone is a narrow belt of country 1,000 miles at least in length. That this belt is an important mineralogical district is shown by the important mining camps situated along its course, as, for instance, Yale District, Bridge River, Skeena section, Alice Arm, Anyox, and Stewart. The Hazelton-Telkwa sections lie in the contact-zone of the Bulkley and Babine mountains some distance east of the main eastern contact-zone of the Coast mountains. Mineralogical conditions in the Babine and Bulkley mountains are somewhat similar to those of the eastern contact-zone of the Coast mountains and form a parallel belt to the east.

The eastern contact-zone of the Coast mountains in the North-eastern District is defined by the Kitsumgallum Valley trench. It must be remembered, however, that this contact-zone is an irregular and indefinite area varying greatly in width, and is always an area in which the general rock formations consist of sediments and volcanics intruded by more recent irruptive rocks, such as granites, diorites, granodiorites, and allied rocks, in the form of batholiths, bosses, and dykes.

According to our present ideas of ore-deposition, it is believed that the great majority of our metallic mineral-deposits are formed as the culminating process in the intrusion of deep-seated molten magmas upward and through the overlying rock formations. In a region, therefore, where such igneous intrusions have taken place on a tremendous scale it is to be expected that valuable ore-bodies would be found. It should be pointed out here that such ore-bodies do not necessarily occur directly at the contact of the intrusive rocks with the older rocks, but may be found at considerable distances from the contacts; and, further, that they may occur either in the older rocks or in the intrusive rocks. The *Rocher Déboulé* mine at Hazelton is an example where the ore-body occurs in the granodiorite intrusive, and the *Silver Standard* mine at Hazelton is an example of the ore-body occurring in the older sedimentary formation at some distance from any intrusive granitic rock.

In considering suitable places for prospecting, the guiding factor should be a consideration of the general geology of the area and whether or not this indicates the area to be one of possible or probable mineral occurrences.

In the North-eastern District the eastern contact-zone extends from Eutsuk lake in a north-westerly direction nearly to the Nass river, a distance of about 200 miles. This zone has been prospected at different points and in many places claims have been staked, but it will repay much further intensive prospecting. The area lying between Terrace, on the Skeena river, southerly to Tahtsa lake has never been prospected and but little is known about it.

Lying to the east of the eastern contact-zone of the Coast mountains are the Zymoetz, Rocher Déboulé, Hudson Bay and other ranges known collectively as the Bulkley mountains. These ranges consist for the most part of sedimentary and volcanic measures with cores of granitic rock. The granitic batholiths are for the most part small and form only a small proportion of the total rock formation. There is, however, plenty of evidence that widespread mineralization has followed the intrusion of the plutonic rocks and dykes.

Many parts of these ranges have not been carefully prospected, as, for instance, Porphyry creek, 20-Mile creek, and others draining the country lying between the Rocher Déboulé and Hudson Bay mountains, and also many parts of the Seven Sisters and Zymoetz ranges.

Lying to the east of the Bulkley mountains and separated from them by the Bulkley river is the Babine range. This range consists dominantly of altered sedimentary and volcanic rocks, with a small proportion of intrusive rocks. Valuable ore-bodies have been found in different parts of the range and wherever prospected there are found evidences of mineralization.

The Babine range has a length of somewhat over 100 miles, and, commencing at the Babine river, extends south-easterly to the portion of the Bulkley river that flows westerly. The southern termination of the range is indefinite, as it gradually fades away into plateau country. The whole of this range of mountains is promising country for prospecting and there are many parts of it that have not been closely examined.

Still farther to the east and north, the country surrounding Takla lake and Driftwood river is believed to be mineral-bearing. Some good specimens of native copper have been brought out of this section. This part of the district can be easily reached by water route from Fort St. James, which point is connected by motor-road to Vanderhoof, on the Grand Trunk Pacific Railway.

As has been previously mentioned, the Manson section is an old placer camp. Gold-bearing quartz veins and galena ores are reported from this section, but the distance from transportation is such that but little prospecting for lode minerals has been done.

In the Barkerville section of the Cariboo Mining Division the presence of numerous quartz veins has long been known. At different times in the last forty years attempts have been made to work these veins for their gold content, but as yet no great success has attended these efforts.

It is apparent that the gold values in these quartz veins are very irregular and spotted. But it seems quite possible that shoots of ore rich enough to mine and mill will yet be found in some of these veins. Throughout the Cariboo Division generally, and extending to the Fort George section, quartz veins occur in abundance, and while undoubtedly many of them are barren, it is possible that a small percentage of them will be found to be well mineralized. Similar quartz veins are found in many parts of the Quesnel Division.

The eastern end of the Cariboo Division contains portions of the Columbia and Rockies systems of mountains. These mountains are separated by the Rocky Mountain trench, which at this point is occupied by the Fraser river flowing north-westerly, and here the Grand Trunk Pacific Railway follows the Fraser to its headwaters in the Yellowhead pass.

In this section mica-deposits are known to occur at Tete Jaune and the occurrence of other minerals are reported, including copper and iron ores. The section is one which is virtually unprospected, and when it is remembered that it is in the Columbia system of mountains that the important mineral camps of East and West Kootenay are situated, it is apparent that there is here a large area with great possibilities of mineral occurrences.

OMINECA DIVISION.

Skeena Section.

Zymoetz River.

The Zymoetz river is an important tributary of the Skeena river, which rises in the Telkwa mountains and, flowing westerly, joins the Skeena river at Copper City, about 100 miles easterly from Prince Rupert. Many mineral claims have been staked in the mountains along the

Zymoetz river and its tributaries, and there are important deposits of iron ore and coal near the headwaters of this river.

Snowflake Group.

Late in 1920 this group of claims, owned by John Gabriel, of Copper City, was bonded by D. A. Buchanan, who represents a private syndicate. The group is situated 12 miles up the Kitnaiakwa river, a tributary stream joining the Zymoetz river 28 miles from its mouth. The claims are on Gabriel creek, about half a mile from the Kitnaiakwa river, and the total distance of the property from Copper City is approximately 40 miles.

Before anything could be done on the property it was necessary to do some trail-construction. A ferry was put in at Mile 28 on the Zymoetz river and a trail was constructed on the last 5 miles of the route into the property. This work was done by Mr. Buchanan, with a grant of $1,000 towards the cost being made by the Mines Department; this grant was made on the usual 50-per-cent. basis. The trail-work was finished in September, 1921, and shortly after Mr. Buchanan packed in supplies to carry on development-work during the winter. Development has been started with a small crew of men and it is expected that it will be continued all winter.

The showing on the property was found at the top of a small waterfall on Gabriel creek, the vein being well exposed crossing the rocky canyon of the creek. The vein really consists of a mineralization along the walls of a dyke. This mineralization is well developed on the hanging-wall side of the dyke and only slightly so on the foot-wall. On further exploration, however, it is quite possible that both walls of the dyke may be found to be well mineralized. The dyke is from 7 to 8 feet wide and strikes at S. 25° E., with a dip of 75° to 80° to the south-west. The country-rock through which the dyke cuts is red andesite and the dyke itself is diorite porphyrite.

The mineralization on the hanging-wall of the dyke consists of a partial replacement of the andesitic rock with metallic sulphides and small amounts of quartz and calcite. The metallic minerals present are arsenical iron, grey-copper, and small flakes of native silver. The total amount of metallic minerals forms only a small percentage of the total gangue. The chief value in the rock is silver, the copper content being quite low. According to Mr. Buchanan, the average values are high, quite sufficiently high to warrant the development of the property.

There is a well-defined foot-wall to the deposit, this being the wall of the dyke; but the hanging-wall is indefinite, as the mineralized gangue material gradually changes to unaltered andesite. It is assumed by Mr. Buchanan that from 4 to 6 feet in width of the deposit may be classified as ore.

As yet very little development has been done on the property. The discovery showing is naturally exposed by the creek and a large open-cut has been made on this on one side of the creek. Along the strike of the dyke no work has been done to uncover it and the only exposure of the dyke is up and down the walls of the canyon.

The development-work that is planned on the property is to crosscut by means of a tunnel from a point below the falls, which will give a depth of 50 feet or more below the outcrop of the ore-body. After the vein (dyke and mineralization) is cut there will be a good opportunity to drift on the vein in both directions and gain depth as the work proceeds.

Iron and Coal.

It was expected that some development-work would be done during the year on the limonite-iron showings and the coalfield on the headwaters of the Zymoetz river. These properties, which have been described in previous Annual Reports of the Minister of Mines, are at present held under option by A. C. Gardé. The development plans apparently did not materialize this year, but it is expected that work will proceed in 1922.

There are many claims along the Zymoetz river and a number of the more important ones have been described in the Annual Reports of the Minister of Mines. The *Dardanelle* group, 15 miles up the river, was examined this year by an engineer for the Granby Company.

Dardanelle Group.

This group consists of four claims known as the *Trail*, *Trail Fraction*, *Independent*, and *Dardanelle*, and is owned by A. Carmichael, James Crocker, and George W. Kerr. The claims are situated near the 13-Mile post on the Zymoetz River trail, some of the workings being just below the trail and the others above. There is a cabin on the property situated close to the lowest working, the elevation at this point being about 450 feet above sea-level.

The rock formations exposed on the property are greenstone (probably altered diabase) and a porphyritic felsite that occurs more or less in dyke form. Not far distant there are intrusive bodies of granodiorite. There are several outcroppings of quartz which probably represent two distinct veins, which are more or less parallel and close to one another. These veins are in several places lying in the contact between the greenstone and the porphyry and at least in one place wholly within the greenstone. The gangue is entirely quartz and the metallic minerals present are chalcopyrite, pyrite, arsenopyrite, bornite, and galena. The total amount of metallic minerals, however, forms but a small proportion of the total vein-filling. The values are apparently mainly in copper, with varying and, in places, important values in gold and silver. The lead content as a rule is unimportant.

On the lower side of the trail there is a tunnel 45 feet long, a shaft 25 feet deep, and several open-cuts which prospect different quartz-croppings. As shown by these workings, the vein or veins are from 2 to 4 feet in width and are sparingly but fairly regularly mineralized with sulphides of iron and copper. An average sample taken across 4 feet of vein on the east side of the shaft 5 feet above the bottom returned on assay: Gold, trace; silver, trace; copper, 1.2 per cent.

The workings above the trail are about 500 feet higher in elevation than the lower workings. It seems highly probable that the quartz-croppings at this point are continuations of the two veins shown in the lower openings. The showings are developed by some shallow shafts and cuts, which show the veins to have a width of from 4 to 5 feet. The most abundant sulphide noted was pyrite, which, however, does not occur in large amounts. A grab sample from the dump of a 10-foot shaft gave an assay of: Gold, 0.6 oz.; silver, 11.4 oz.; copper, 2.4 per cent.

The property is favourably situated, not too far from rail transportation, and with available water-power near by. The veins are well defined and should prove permanent. The main question is one of values, which, as shown by the present development, seem to be somewhat low. However, it is quite possible that these veins may carry shoots of ore which could be extracted at a profit. The high silica content of the ore might be useful to certain smelters as a flux, thereby ensuring a favourable smelting rate on the ore.

Usk.

In the vicinity of Usk development operations and prospecting were continued throughout the year, but no ore shipments were made. The Usk District collection of ore specimens again won the Grand Challenge cup at the Prince Rupert Fair, and the cup having been won for two years in succession, it now becomes the permanent property of Usk District.

Kitsalas Mountain Copper Co.

Early in the year this company resumed development of the No. 2 vein (blind-vein) exposed in the crosscut tunnel. This vein had been developed by a winze a few feet deep and this winze was deepened to 30 feet. The vein improved in size and values with this work, there being 5 feet of pretty well mineralized quartz at the bottom. Average assays by the management are said to show it to be a satisfactory grade of ore. As working in this winze was expensive and troublesome owing to a considerable stream of water, it was decided to run a lower crosscut tunnel so as to cut this vein at a point below the bottom of the winze. This crosscut tunnel will be about 400 feet long to strike the vein, and will give a depth of 80 feet below the top of the winze. The crosscut was started on August 1st and the work is being continued steadily. At the commencement of the tunnel a considerable thickness of surface wash had to be penetrated and for a time considerable trouble was experienced in driving through a mixture of loose sand and clay. This material flowed so readily that it was necessary to use face-boards and timber the whole drift tightly. By the middle of November the tunnel was in 130 feet and still in loose gravel. For detail descriptions of this property *see* previous Annual Reports.

Kleanza Co.

This company was primarily organized as a lumbering and sawmilling concern, but in a short time became also interested in mining activities. In 1919 the company acquired the *Golden Crown* group and carried out some development-work. Several groups of claims were then secured, extending from the *Golden Crown* group on up to the top of Kleanza mountain. A sketch-map showing the holdings of the company appeared in last year's Annual Report.

On the property held by the Company there are a large number of quartz veins which vary in width from a few inches up to 5 feet. The general formation of Kleanza mountain is grano-

diorite, which in places is somewhat basic and schistose. The quartz veins have a general strike of north-west and south-east and are therefore roughly parallel. The important sulphide minerals which are found in these quartz-filled fissures are pyrite, arsenopyrite, and small amounts of chalcopyrite. The important value is gold. The mineralization is irregular, as some of the veins are apparently barren of minerals, while others carry in places considerable amounts of sulphides. The arsenopyrite would seem to carry most of the gold, although some of it may be also in the chalcopyrite.

The work so far done consists of a number of tunnels on the *Golden Crown* group and considerable open-cutting and stripping and short tunnels on the *Valhalla* and *Kleanza* groups. Further work was carried on during the summer of 1921 with a small crew of men and stopped for the winter when the snow came.

It is hoped by the management that some of the veins will on development be found to carry shoots of ore that will pay to mine and mill. It is realized that some of the veins are barren, but others carry good values in places, and development may show a sufficient tonnage of such ore to warrant the erection of a mill.

There is a good water-power on Kleanza creek which the company has commenced to develop in connection with its sawmill, which has been erected. The mineral property of this company is conveniently located, from 3 to 5 miles from the railway, with an available water-power and plenty of timber at hand.

K. Partnership.

During the summer the "K. Partnership" (H. H. Gillson, manager) acquired a lease on the *Golden Crown* group. This property is situated near the foot of Kleanza mountain, about 3 miles from Usk, and is controlled by the Kleanza Company. A Ross mill was erected on the property by the leasing syndicate and a test run was made on ore from one of the dumps. The Ross mill is a recently patented machine designed to treat gold ore. It is in effect a grinder and amalgamator contained in a small upright steel cylinder, the grinding being done by steel balls which revolve around in a groove. The ground pulp is splashed out through openings by the rotating action of the machine. Amalgamation takes place on baffle-boards inside the machine, and, if desirable, the pulp from the machine can be passed over an amalgam-plate.

The Ross mill is made in sectional parts, so that it can be packed anywhere and used for small-scale operations. In trying out the Ross mill at the *Golden Crown* a small crusher was used for reducing the ore to ½-inch size. This crusher was much too small as it would only handle a few hundred pounds a day, whereas the mill would treat from 5 to 10 tons a day. Work was stopped by the partnership in a short time and their future plans are not known.

Information regarding the Ross mill can be obtained from J. D. Ross, 291 Dufferin Street East, Vancouver, B.C.

Kleanza Creek.

Further work was done in putting in the new piece of trail from Usk to the head of Kleanza creek during the summer. The usual assessment-work was done on a number of groups of claims in this section and some of the properties were examined by scouting engineers looking for copper properties.

Legate Creek.

The claims situated in the mountains at the head of Legate creek have not had as much attention paid to them as they would seem to warrant. A number of these showings have been described in previous Annual Reports of the Minister of Mines. The different properties are situated from 1 to 3 miles from the forks of the creek. The main trail from Pacific goes to the forks, a distance of about 12 miles, and from this point there are branch trails to the different properties. The locality is easy of access and the distance of the claims from the railway is not prohibitive.

On some of the properties quartz-filled fissure-veins occur carrying galena, tetrahedrite, pyrite, chalcopyrite, and other iron and copper sulphides. The important value is in silver and some very high-grade ore is found in places. The ore is high enough grade to stand packing out if hand-sorted, and the properties might be opened up in this way to the point where there would be sufficient milling-ore to warrant the erection of a mill.

On other properties, notably the *M. & K.*, important copper values, together with silver and lead, occur in the ore. This property with some others was taken up in 1920 by the British

Columbia Exploration Company. This company apparently lost its interests in this section through a sheriff's sale of their assets this summer.

The *Halliday* group has been further developed by the owner during the last two years and he now reports that the showing is a very promising one.

The district generally will repay systematic examination by scouting engineers.

Hazelton Section.

Silver Standard. This mine, which was closed down in October of 1920, remained closed all year. There was some possibility of the mine being reopened late in the fall, but this did not materialize. The reasons which caused the management to close down in 1920 were the high operating costs and high freight rates on concentrates, together with the lessened market price of silver, which is the most important value in the ore. Conditions now are considerably better than when the mine was closed, as silver is higher in price and there has been a considerable drop in wages and the costs of mining supplies. The high freight rates, however, still prevail, and in the case of this company shipping silver-lead concentrates to the Trail smelter and silver-zinc concentrates to Oklahoma, the amount paid out in freight is a very considerable proportion of the value of the ore. The mine is in good shape and there would seem to be every reason for expecting operations to be resumed early in 1922. A car-load of concentrates was shipped from the mill this summer representing a clean-up of odd lots around the mill-bins.

At the time of writing this (January, 1922) the mine has been reopened with a crew of about fifteen men under the superintendency of W. G. Norrie-Lowenthal, who was in charge during the previous operations. It is not expected that the mill will be started until March. Detail descriptions of this property can be found in previous Annual Reports.

Delta Copper Co. A contract for 1,000 feet of diamond-drilling on the property of the Delta Copper Company was let in the fall of 1920 to Lynch Bros., of Spokane. On account of snow it was impossible to carry out this work last winter, but as soon as practicable this summer the drilling was carried out. On the completion of the 1,000 feet of drilling all work was stopped and the future plans of the company are not known. The results obtained from the drilling have not been made public.

Thoen Basin.

One of the old highways of the country before the days of the Grand Trunk Pacific Railway and motor-roads was the Babine trail, which commenced at Hazelton and crossed through the heart of the Babine range to Babine post (Hudson's Bay Company's post), on Babine lake. Extensions of this trail served the placer-fields of the Omineca and Ingenika. This trail is still extensively used, but does not have as much travel as in former years. This trail enabled lode-mineral prospectors to prospect that portion of the Babine range contiguous to the trail, and some years ago many claims were staked in this part of the range. Many of these claims have since been abandoned, and, generally, little or nothing in the way of development or prospecting has been done in this section of the country in the last four or five years. It would seem that many of these old locations were never given proper consideration, and, inasmuch as there is evidence of widespread mineralization in this section, it is apparent that it is still a promising field for prospecting. Some of the abandoned claims may warrant development, and more intensive prospecting than was done at the time of the first running-over of the country may be well repaid by important new discoveries.

The Babine range is a well-defined range unit extending from the Babine river on the north to the westerly flowing portion of the Bulkley river on the south, a distance of about 100 miles. The range has a width varying from 30 to 60 miles. Roughly, these mountains are encompassed by the Babine and Bulkley rivers and Babine lake. The Babine range belongs to the Interior system of mountains and differs considerably from the mountains of the Pacific system lying to the west. Granitic rocks are not nearly as plentiful as in the Pacific system. So far as is at present known, the great batholithic activity of the Pacific system is represented in the Babine range only by minor batholiths, bosses, and a wide variety of dyke and apophysal forms. There

is, however, considerable similarity between the Bulkley mountains of the Pacific system and the Babine mountains. Rocks belonging to the Hazelton formation are the predominant measures in both sets of mountains, with, however, a greater development of batholithic granitoid rocks in the Bulkley mountains.

Topographically the Babine range presents considerable diversity of types. The southern end of the range merges almost imperceptibly into the Nechako plateau, while easterly from Hazelton the mountains are high, rugged, and alpine in character. In that portion of the range contiguous to the Babine trail elevations up to 7,500 feet are found and many small glaciers and snow-fields occur. Timber-line is at from 4,000 to 4,500 feet. Much country lies above timber-line and this is easily prospected, but the season is of course short, as the snow does not go off until June or July and may come again at the end of September.

The Babine trail follows the Bulkley river for a few miles after leaving Hazelton and then continues on up the Suskwa (Bear) river, a tributary of the Bulkley, to its head and then down to Babine lake. Coming into the Suskwa on both sides are a number of tributary creeks which head up into the high peaks of the Babine range, and at the heads of a number of these creeks claims have been staked. One of these creeks is known as 31-Mile creek, so named because the 31-Mile post on the Babine trail is situated about where the trail crosses the creek. The country at the head of 31-Mile creek is known as Thoen basin, named after Henry Thoen, an old-time prospector of this section. From the main trail to the head of this basin there is a branch trail 3 miles long. Thoen basin proper is a large basin at the head of the creek, which is split in two parts by a long spur running down from a high peak. Claims have been staked on both sides of the basin and over the divide and in adjoining basins at the heads of smaller creeks. All claims in this locality are commonly referred to as being situated in Thoen basin.

A trip was made into Thoen basin late in September and it had been intended to examine all the claims in that section. Unfortunately an early snowfall made it necessary to get the horses out at once and only some of the claims were examined. A deposit of low-grade copper-ore situated over the divide from Thoen basin and owned by Henry Thoen and partners was one of the properties which unfortunately was not examined. The elevation of the divide at this point is about 6,500 feet and it is a bad place to cross unless in fine weather.

There is an abundance of water-power available on various creeks throughout this section, as owing to the mountainous nature of the country the creeks descend rapidly.

True Fissure.

This property is situated on the western side of Thoen basin and extends up the steep mountain-side. It is owned by Gordon McLennan and Pete Jennings. The lowest showing is at an elevation of 5,600 feet and the upper showings are at about 6,300 feet, while the vein apparently continues above this in steep bluffs. The rock formations exposed on and near the property consist of quartzites, argillites, and tufaceous rocks of the Hazelton formation, which are intruded by a small boss of granite. This intrusive rock is a light-coloured medium-grained biotite granite and has considerably affected by metamorphic action the sedimentary measures near the contact. Dioritic dykes also cut the formation; these dykes are characterized by long crystals of feldspar.

The main ore-showing on the property is a fairly well-defined replacement-fissure type of vein which is well exposed, cropping at different points up and down the mountain-side. The vein has evidently been more of a sheared zone than an open fissure and in places the ore is "frozen" to the walls. The vein strikes north-east (mag.) and dips at 55° to the north-west. The sulphide minerals found in this vein are galena, zinc-blende, pyrite, and small amounts of grey-copper. The gangue is mostly altered wall-rock, but some quartz occurs in places. The ore in places is a brecciated mass of sulphides and fragments of more or less silicified wall-rock. The wall-rock is of variable character, depending on the particular sedimentary bed through which the vein cuts, but is generally argillitic in composition. Zinc-blende is present in considerable quantity in the ore and there is but little solid galena free from blende.

The vein, which has a width of from 1 to 2 feet, is fairly well mineralized, but, as is customary, the ore runs in shoots and parts of the vein are only slightly mineralized. Where the vein is well mineralized the sulphides are in many places confined to a band of nearly solid mineral (generally mixture of galena and zinc-blende); these bands vary from a few inches up to a foot in width.

The principal value in the ore is in the high silver content, although the lead and zinc contents are appreciable. The following table of assays gives some idea of the values:—

Description.	Gold.	Silver.	Lead.	Zinc.
	Oz.	Oz.	Per Cent.	Per Cent.
Across 1 foot at lowest showing	Trace.	20.5	Trace.	30.0
Across 18 inches of vein at highest showing on ridge	0.08	30.0	6.0	24.0
Selected ore from ridge	0.06	168.5	24.0	28.0
Selected ore from vein below tunnel	0.06	76.5	22.0	30.0
Selected ore by the owner	0.08	203.4	36.0	20.0

It will be noted that very few average samples were taken. At the present time they are not as important as are samples taken so as to represent hand-sorted ore. It would be quite impossible to ship average grade of ore from such a place as this, with shipment by pack-horses over 30 miles of trail. It is a possibility, however, that carefully hand-sorted ore would stand the transportation charges, and so a number of samples were taken to determine what the selected ore would run.

There is very little work done on the property. A few open-cuts have been made and at an elevation of 6,200 feet a tunnel has been started and faced up. But the vein is naturally exposed at a number of places up and down the mountain-side. Above the tunnel there is a good cropping of the vein on a ridge projecting out from the general slope of the mountain. Above this the vein continues, but is practically inaccessible. The highest showings on the vein contain the best ore, and it is reasonable to expect that a drift-tunnel going in on the vein would show up some good shoots of ore. The silver values in the selected ore make it a reasonable speculation to explore this vein to see whether or not it contains a sufficient quantity of this class of ore to pay to mine it.

About 500 feet north of the silver-lead vein there is another showing on this property known as the "Iron Showing." This is a sheared zone lying only a short distance from where the granite is intrusive into the older rocks. The outcrop runs up and down a steep rock gulch and shows an irregular vein from 2 to 4 feet wide, which is mineralized with arsenopyrite and pyrrhotite. Assays of this material show only traces of gold and an ounce or two of silver to the ton. There are none of the galena-zinc minerals present in this showing. There has apparently been a considerable development of iron minerals in and around the contact of the granite with the older rocks, as there is a considerable "iron-capping," which has evidently been formed by oxidation of original iron sulphides. Oxidation, however, is apparently mainly a surface phenomenon, as the sulphides are always found at or close to the surface.

This property is only about 20 miles distant from the railway, and in the event of the development warranting it, a suitable route for a wagon-road direct to the railway is available down the Suskwa river. A new piece of trail 3 miles in length would cut out the last 6 miles of the present trail. A suitable water-power could be developed on some of the near-by creeks.

O.K. Group. This group of claims is situated at the head of Thoen basin at an elevation of 5,950 feet. It is owned by Henry Thoen and partner. A short distance from the showings and at a lower elevation, at the edge of timber-line, there is a good cabin which serves as a headquarters for the owners of claims in and around the basin.

Interbedded sedimentary and tufaceous rocks make up the formation as exposed on the claims. The showings consist of small stringers which apparently follow the bedding-planes of the sediments and strike along the face of the hill; they lie nearly flat, with a slight dip into the hill. Several cuts and one 30-foot tunnel have been made to develop these showings. Most of the veins are very considerably leached out, so that the filling now consists of iron oxide, together with some lead carbonates. The tunnel cuts through one stringer about 6 inches wide, which is entirely leached and shows no sulphides. Another stringer crops out above the tunnel, but the tunnel has not been driven far enough to crosscut it. This stringer, which is about 10 inches wide, is also leached, but in places shows from 4 to 6 inches of solid galena. A sample of this solid galena assayed: Gold, 0.02 oz.; silver, 190 oz.; lead, 70 per cent. A

sample taken across 10 inches of leached vein-filling returned: Gold, 0.02 oz.; silver, 80 oz.; lead, 36 per cent.

The veins on this property show a nice quality of silver-lead ore and it is to be hoped that development will show appreciable sized ore-shoots of this kind of ore.

Babine. This claim is situated about 2 miles westerly from Thoen basin on a steep bare mountain-side at an elevation of 5,750 feet. The showing consists of a small vein occurring in quartzite striking north-east (mag.) and dipping at 65° to the north-west. The vein is from 6 to 8 inches wide and the filling is mainly arsenopyrite, together with some quartz. Average samples show that this arsenical iron carries from $5 to $12 a ton in gold values and 1 to 3 oz. of silver.

Boulder Creek.

Boulder creek rises in unnamed mountains lying to the south of Rocher Déboulé mountain and flows easterly to the Bulkley river, joining that river not far from Seaton Station, on the Grand Trunk Pacific Railway. The creek is about 12 miles in length and has a fairly rapid rise, as its head is in a basin at timber-line, while the elevation at Seaton is 1,280 feet. Claims were staked at the head of this creek some years ago, but most of them had been allowed to lapse. Very little prospecting or work of any kind has been done on the creek for some years.

Sultana Group. This group consists of four claims—the *Sultana*, *Sultan*, *Mugwump*, and *Dolores*—and is owned by A. R. Macdonald and Joseph S. Hicks. It is situated on the east side of the basin at the head of the South fork of Boulder creek. This basin is a large one, with terraced benches rising upwards. The showings are at an elevation of 5,300 feet on a flat bench well above timber-line. The rock formation at this point is a typical coarse-grained granodiorite which is intrusive into older volcanic measures. The surface outcrop of the ore-body is an iron-capping and at the present stage of development the nature of the ore-body is not clearly apparent. When the writer examined the property there was a certain amount of old snow covering the ground and it was rather difficult to size up the showing.

The ore-body may be a definite vein or sheared zone in the granodiorite or it may be of some other nature. A large open-cut 30 feet long and 12 feet deep at one end apparently crosscuts the line of strike of the ore-body, and if so, then the ore-body is of considerable size. It is possible that the ore is developed at the intersection of cross-fissures and that at this point there is a large lens of ore.

The sulphide minerals present in the ore-body are pyrite, tetrahedrite, and small amounts of galena and chalcopyrite; a few specks of molybdenite were also noted. The pyrite is present in considerable quantity and some of it may be arsenopyrite. The surface of the deposit is turned into a typical iron-capping by the oxidation of the iron sulphides, with a plentiful distribution of iron oxide scattered through decomposed granitic rock-matter. There is not any great development of quartz in the deposit, the gangue consisting mainly of somewhat altered granite.

Surprisingly good values were obtained in the samples taken by the writer, as is shown by the following list:—

Description.	Gold.	Silver.	Copper.
	Oz.	Oz.	Per Cent.
Across 8 feet near upper end of cut	0.02	29.0	1.7
Across 10 feet continuing down cut from first sample	0.06	59.0	5.2
Selected ore from two bands of sulphide in the cut	0.10	86.0	13.2
Selected ore showing grey-copper	0.06	112.0	16.0
Grab sample from dump from small cut 50 feet south-west of big cut	0.01	31.5	3.7

Lying south-west of the big open-cut there is a small hole which is supposed to prospect a continuation of the vein in that direction. This hole was full of snow, but it was apparent from the dump that most of the rock taken out in digging the hole was well mineralized and the grab sample taken showed it to be good ore.

This property has been staked for some years, but apparently very little work has been done on it. In 1920 the present owners of the property obtained trail permit for assessment-work and improved the trail going up Boulder creek. This year they did the assessment-work and tried to trace the vein on the surface. They succeeded in finding indications at a point several hundred feet to the north. The granitic rock at this point is stained with iron oxide and this may be the iron-capping lying above the vein.

The silver values in the ore are apparently mainly associated with the grey-copper. No assays were made for lead as the galena content is negligible.

This property has a very promising surface showing, and if the ore-body is continuous in length with the width and values shown in the big open-cut it may prove to be a very important find. The owners intend to do considerable development-work next year. In the meantime, however, the property may be an attractive one to some of the scouting engineers that are looking for promising prospects.

The situation of this property is a favourable one. The ore could be handled nicely by a short tram down to a point on Boulder creek, from which a good wagon-road on an easy grade could be made to the railway. The length of this road would probably not exceed 10 miles. There is plenty of timber for mining purposes close to the property and on Boulder creek and its branches a certain amount of water-power is available.

This locality is one which warrants much further prospecting than it has been given. Some years ago the country lying between Rocher Déboulé and Hudson Bay mountains was roughly prospected, but much of it was never even gone over and in recent years no prospectors have been in to it. The country is mountainous, with several creeks rising in the mountains and flowing easterly to the Bulkley river, such as Porphyry, Boulder, and Gramaphone creeks. The rock formations exposed are mainly Hazelton formation (sediments and volcanics) intruded by granites, granodiorites, and porphyries. Such geologic conditions are favourable for the occurrence of mineral-bearing deposits. Prospectors are therefore advised to consider the possibilities of this section.

Telkwa Section.

Babine-Bonanza Mining and Milling Co.

The property of this company, which is situated on the Babine Lake slope of the Driftwood Creek divide, has been under development for a number of years. The control of the company is held by James Cronin, who has actively directed the development-work. The property has been described at length in previous Annual Reports, so that the history of the early development need not be given here. Steady development of the property was again carried out during the season, a gang of about ten men being employed all summer and until late in the fall, when weather conditions became bad. The mineral-showings on this property consist of several quartz-filled fissure-veins and a contact ore-body lying between rhyolite porphyry and a black schist. The valuable minerals contained in the ore-bodies are galena, zinc-blende, and small amounts of pyrite, arsenopyrite, and tetrahedrite. In the veins the gangue is principally quartz, while in the contact ore-body there is, in addition to quartz, altered rhyolite intimately associated with the metallic minerals. Shoots of nearly solid galena and also of zinc-blende occur in all the ore-bodies, besides which there is much disseminated rock-matter carrying sulphides, which varies in value all the way from slightly mineralized rock to high-grade mill-feed.

The upper workings consist of a number of shafts and tunnels which develop certain veins and the contact ore-body down to a depth of from 150 to 200 feet. In 1919 a lower crosscut tunnel, No. 2, 225 feet below No. 1 tunnel, was started and was driven in to cut the main contact ore-body, which was accomplished in 1920.

The following information concerning the operations this year has been supplied by the company: "The chief result was the ascertaining for a certainty which of the bodies of ore found in the lowest level (No. 2 tunnel) last year constituted the main vein. When work was stopped last year there remained indications that the main vein might lie beyond the point to which this tunnel was driven up to December, 1920. This year, therefore the main tunnel was continued some distance as a crosscut through the formation which lies parallel to the main vein. A number of mineralized seams were encountered, the best at 90 feet, showing 6 to 8 inches of clean galena. Work was started later in the Junction drift, and shortly after starting a distinct improvement in that vein confirmed the belief that it is the main vein. The reason this vein in the Junction drift improved so steadily in the portion of the drift run this summer

must be attributed to getting away from the disturbed condition at the junction of this vein and the East and West veins. It is to be regretted that it was not possible to extend the work in the Junction drift to a point under the large ore-shoots on the upper levels. It would be only reasonable to expect a very good showing in view of the marked improvement in other features on this level."

As the ore developed in this tunnel is from 400 to 450 feet below the surface outcrops, there is therefore a considerable tonnage of probable ore developed in the mine. A raise through to the No. 1 tunnel would give interesting information regarding the continuity of the ore-shoots. It is apparent that this property is about ready to be equipped with machinery and a mill so as to commence its productive stage.

Driftwood Creek.

Rainbow Group.

This group of claims, owned by J. S. Kelly, S. Gazely, and R. Macklin, is situated on the east side of Driftwood creek, about 15 miles from Smithers. There is a wagon-road to within about 3 miles of the property and then a good trail that goes within half a mile of the showings. At an elevation of 4,250 feet the vein is

exposed, striking S. 55° W., angling along the hillside, with a dip of about 60° to the south-east or into the hill. The country-rock is red andesite and the vein is of the sheared-zone type with indefinite walls. The metallic minerals occurring in the vein are chalcopyrite, tetrahedrite, and a little chalcocite. The gangue is altered wall-rock, together with some calcite and siderite. At the time of examining the property a large open-cut had been made on the showing, and this exposed a width of mineralization of from 4 to 5 feet. The actual width of the vein may be more or less, as no well-defined walls were in evidence. A sample was cut across 4½ feet of the vein at this point, which returned on assay: Gold, trace; silver, 13.6 oz.; copper, 5.4 per cent. A selected sample assayed: Gold, trace; silver, 71 oz.; copper, 4.2 per cent.

No further work had been done to expose the vein at different points along the strike, but during the summer the owner has put in a good deal of time prospecting the property. He reports that he has now an excellent showing. This would seem to be a vein that warranted further exploration.

Driftwood Creek. This claim was worked during the early spring by a Smithers syndicate, the work being under the supervision of J. J. Driscoll. The claim lies to the south of the *Rainbow* group (described above). At an elevation of 3,900 feet a tunnel has been driven in 25 feet on a small quartz vein, which is well mineralized with chalcopyrite and chalcocite. Fifty feet below the upper tunnel another tunnel has been driven 75 feet, the first 35 feet of which is a crosscut and the last 40 feet a drift on the vein. Apparently this is the same vein as exposed in the upper tunnel. A selected sample taken from the dump (containing about 3 tons) at the mouth of this tunnel assayed: Gold, 0.04 oz.; silver, 47.5 oz.; copper, 14.5 per cent.

Lower down the hill there are mineralized outcrops on which little or no work has been done. One of these is from 2 to 4 feet wide and is mineralized with the usual copper minerals. It is apparently worth development.

Harvey Group. This property, which is situated on Driftwood creek, 12 miles from Smithers, has been taken under lease and bond by an Edmonton syndicate. Work was started in the spring and a crosscut tunnel commenced. This was driven 170 feet, but in that distance had not reached the vein. From a consideration of the flat dip of the vein, it was hardly to be expected that the vein would be cut before going at least 200 feet. For reasons which are not known, the syndicate stopped work, but the option is still retained.

The showings on this property have been described in previous Annual Reports. The principal values in the ore are in silver, with a little copper. The veins, which are from 4 to 8 feet wide, are of the sheared-zone type and carry tetrahedrite, chalcopyrite, and chalcocite in a gangue of altered wall-rock.

Silver King Group. This property is situated at the head of Driftwood creek and is owned by Patrick J. Higgins. Last year this property was under bond to a local syndicate, but their option has now lapsed. The owner commenced a crosscut tunnel this year to tap the vein at some depth below the present drift-tunnel. The showing consists of a quartz vein carrying tetrahedrite, some native silver, and subsidiary amounts of copper-iron sulphides. The principal value is silver and some very nice assays have been obtained. The vein, which is from 6 inches to 2 feet wide, is developed by a drift-tunnel 100 feet in length.

Other Properties.—Other properties in this part of the Babine range on which the owners did work during the year were the *Victoria* group, Martin Kane's property, Simpson property, and Carson property.

Aveling Coal Property.

This property is situated on the north side of the Telkwa river, 7½ miles above the town of Telkwa. It is owned by Major Aveling and partners and Rattenbury Lands, Limited. About the end of 1920 a five-year lease on the property was obtained by Gillespie & Wilson, who formerly had been operating the property of the Telkwa Collieries under lease. The mine is connected with the shipping-point of Telkwa by wagon-road, but considerable repairs and improvements are needed on this road before it can be classed as a first-class road. At present this road is quite suitable for winter haulage on sleighs, but would require a further expenditure to make it suitable for tractor-haulage. During the year some improvements to the road were made, including a bridge across Mud creek, which was built by the Government.

SKETCH MAP OF
AVELING COAL
PROPERTY,
TELKWA, Omineca Mining Division
To accompany Report of
J. D. Galloway, Resident Engineer.
1921
Scale:
½ ½ ¾ 1 mile
B.C. Bureau of Mines.

Gillespie & Wilson commenced work on the property about the end of 1920 and for some months carried on development-work and made some shipments of coal. During the summer of 1921 the property was equipped with camp buildings, bunkers, and a bridge across the Telkwa river. This bridge has rails laid on it and connects with the coal tunnel, which is right on the north bank of the Telkwa river. The bunkers are on the south side of the river and the coal is trammed from the workings across the bridge to the bunkers. Shipping of coal was recommenced in the fall, but owing to bad weather and the poor condition of the road not much was accomplished until sufficient snow came for sleighing. During the month of December from 10 to 15 tons a day was shipped.

The various coal-basins on the Telkwa, Zymoetz, Bulkley, Skeena, and Kispiox rivers were all examined and reported on by W. W. Leach, of the Geological Survey of Canada, some years ago. These reports were published in the Summary Reports of the Geological Survey, 1905 to 1910, and in a bulletin entitled "The Telkwa River and Vicinity." Accompanying this bulletin is a topographic map of the Telkwa River area.

According to Leach, a number of these coal-basins hold out some promise of containing considerable tonnages of good-grade coal, while others are too small or broken up or the coal is rather high in ash content. Many of these basins represent fragments of extensive coalfields, the greater portions of which have been removed by erosion.

The geologic age of these coal-measures is placed as being Lower Cretaceous, the whole series of coal-bearing beds being known as the Skeena formation. Throughout the formation the coal may be classed as bituminous, although in places it is a high-carbon bituminous coal. Generally speaking, the coal wherever found in the Skeena formation is of good quality, except where a high ash content renders it unsuitable as a fuel. Some seams contain coking-coal, while others are non-coking.

The coal cropping on the bank of the Telkwa river on the Aveling property is known as the Betty seam, and as at present known is the most important showing on the property. There are other seams cropping which are promising, but as yet no development has been done on them; one of these is known as the Major seam, which is exposed about half a mile away from the Betty seam.

Development of the Betty seam consists of two tunnels driven in on the coal, the longest being about 100 feet in length. These tunnels are only a short distance apart, and now the taking-out of coal has connected them and opened up rooms between. The seam strikes N. 50° W. (mag.) and dips at about 14° to the north-east. By this dip the coal is rising slightly going up-stream, but the indications of coal farther up the river would indicate that the dip changes. Going northerly from the coal-outcrop there is some flat land on the river-bank, but in a short distance the ground rises in a series of benches to form a high hill.

The Betty coal-seam is exposed along the bank of the river for a few hundred feet, but is not positively identified elsewhere. The development so far is limited to the short distance proven by the tunnels, as no drilling or other deep development has been carried out. The Telkwa geologic map-sheet by W. W. Leach (Geological Survey of Canada) includes this area, and this map shows that at this point there is an area of from 3 to 4 square miles of coal formation. The position of the Betty seam and the topography of the ground would indicate that the seam would be likely to be continuous throughout a considerable portion of this coal formation. If so, then there is quite a large tonnage of coal in this property. It would be useless to give any estimate of the coal in the field at the present time and until some development-work is done. The indications are such however, that the property will warrant extended development.

Accompanying this report is a sketch-map (copy of map by F. B. Chettleburgh) and sections of the Betty and Major seams. From these sections it will be seen that there is over 18 feet of coal in the Betty seam, practically all of which could be mined free of shale and waste material. At the present time a band of coal 2 feet thick is left for the roof, as it makes a better roof than the soft friable shales. Below this top coal there is an 18-inch band of coal that is being sold as blacksmith-coal. Two main bands of coal are being worked at the present time, the top one being 6 feet thick and the bottom one 4 feet. There is coal above and below these bands and they are separated by about 4 feet of coal, in which there are some shale-bands.

The coal is of an excellent quality, as will be seen from the following table of analyses:—

Description.	Moisture.	Vol. Com. Matter.	Fixed Carbon.	Ash.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Sample across 18 inches, blacksmith coal	1.8	31.0	63.6	3.6
Sample across 4 feet 6 inches right below 18-inch band	2.6	24.8	68.1	4.5
Sample across same 4-foot 6-inch band at another place	2.4	25.1	67.6	4.9
Sample across 4-foot band at bottom of seam	2.2	22.7	68.2	6.9
Sample across same 4-foot band at another place	2.0	22.8	67.8	7.4
Grab sample from coal-bunkers	1.8	26.4	65.9	5.9
Average of above analyses	2.1	25.5	66.9	5.5

By applying Dowling's Split Volatile Ratio to the above average analysis, the coal would be classed as a bituminous coal, but lies very close to the classification of high-carbon bituminous coal. The moisture content of these samples is probably slightly higher than will be found in the coal when at some distance from the surface. One noteworthy feature of this coal is the low ash content, which is considerably lower than that of most coals now being sold in British Columbia. It is evident from the above analyses that this coal will prove very satisfactory as a steam-coal and will also be a desirable domestic fuel. The coal has also had a fair trial in the local market and at Prince Rupert and is giving satisfaction everywhere.

About the end of the year a fault was struck in driving ahead the main tunnel and work was stopped at this point. An examination of the fault shows that it is apparently a normal fault caused by the outcropping measures slipping downhill towards the river. Such minor faults are to be expected and no difficulty should be experienced in picking up the coal again. At the present time, however, the lessees prefer to get out coal for shipment rather than to do development. When the roads get bad in the spring there will be a time that it will be impossible to haul coal and development will be resumed.

The opening-up of this coal property would be expedited by diamond-drilling and, if the results were satisfactory, the building of a branch railway from Telkwa. No such plans are, however, being considered. The lessees intend to mine coal and ship by wagon, sleigh, or tractor haulage, and to gradually develop the mine by advancing the tunnels. A good market for this coal is available at Prince Rupert, and if a better road had been made to the mine this summer a much larger tonnage of coal would have been shipped. The cost of hauling over a poor road for 7 miles leaves but little margin for mining the coal. However, it is expected that with good sleighing conditions this winter steady shipments will be made. As the lease held by Gillespie & Wilson can be terminated at any time on thirty days' notice in the event of the property being sold, there is not much inducement to them to make any heavy capital investment in road or other improvements or development.

The quality of this coal and the price that Gillespie & Wilson quote for it laid down f.o.b. the railway-cars at Telkwa is such that this coal can compete very successfully with Vancouver Island or Alberta coal. As yet, of course, the amount sent to Prince Rupert has been insignificant, but still the coal-dealers of that city are very anxious to secure a steady supply of it. It is apparent that if this coal can be mined and hauled over 7 miles of indifferent wagon-road and sold at a profit there are great possibilities for the property if opened up and equipped for large-scale mining and provided with railway transportation. In addition, a plentiful supply of good coal at a reasonable price would have a stimulating effect on all Northern British Columbia. The shipment from this mine for the year was 800 tons.

Other Coal Properties.

For detail descriptions of the Zymoetz River coalfield, Jefferson-Dockrill coalfield, Telkwa Collieries property, and others, *see* the Annual Reports of the Minister of Mines from 1914 to 1920.

Hudson Bay Mountain.

There has not been a great deal of mining activity on Hudson Bay mountain during the year 1921. The usual annual assessment-work and small-scale development-work were carried out by the owners on a number of properties.

Mamie Group.

About the beginning of December J. R. Turner returned to Smithers to resume operations on the *Mamie* group. This property is owned by J. Aldrich and in 1919 a bond on it was obtained by J. R. Turner, acting for a Seattle syndicate. Work was commenced late in 1919 and continued until about March, of 1920. Mr. Turner then left and apparently the bond lapsed through non-fulfilment of the conditions. On returning in December of this year Mr. Turner arranged an extension of the bond in a manner satisfactory to himself and Mr. Aldrich. Work was started shortly before Christmas with a crew of half a dozen men and will be continued all winter.

The property is situated on the southern slope of Hudson Bay mountain and is connected with Smithers by a sleigh-road 12 miles long. This road can be used for light wagons in the summer-time. If necessary, it can be easily improved into a good road for hauling ore or concentrates.

The showing on the property consists of a well-defined vein averaging from 4 to 5 feet in width and mineralized with zinc-blende, arsenopyrite, and in places a little galena. The development consists of surface cuts and an 18-foot shaft and a drift-tunnel driven by J. R. Turner in 1919–20. The present work is to continue this drift-tunnel, which is in about 125 feet, and also to sink at some place a winze from this drift.

Good gold values are reported from assays of the ore, besides which there is a considerable zinc content. At the end of the year it was reported that the development was proceeding favourably.

OIL.

What might be described as an "oil boom" has arrived in Northern British Columbia, and much interest is being taken in the question of possible oil-producing regions existing at different points. Up to the present time local people have been the pioneers in the different places which have been considered, but the attention of outside interests has been attracted and several "oil scouts" have made preliminary examinations.

The Kitsumgallum valley, which stretches northerly from Terrace, a town on the Grand Trunk Pacific Railway, was the scene of the first activity. This lies in the North-western Mineral Survey District, just a few miles west of the boundary-line between that district and the North-eastern District. As the area lies in Mr. Clothier's district the writer did not examine the field. The first leases in the field were acquired by C. F. Schaub, who turned them over to the Kitsumgallum Basin Petroleum Company. Up to the present time the energies of this company have been devoted almost entirely to an extensive stock-selling campaign.

Burns Lake.—At Burns Lake a local syndicate headed by D. Gerow has been actively engaged in looking into the oil possibilities of that area. The first leases were staked by Mr. Gerow on the south shore of Burns lake; later leases were staked by Arthur Wood around Francois lake, which lies 14 miles south of Burns lake, and now a large number of leases have been applied for in the Burns Lake–Francois Lake section generally.

Drilling operations were started by the Gerow syndicate during the summer with a light water-well drilling rig driven by horse-power. Before long the use of horses was given up and a 6-horse-power gas-engine was used to drive the drill. The site chosen for the drill is about 100 yards from the edge of the lake and directly opposite the town of Burns Lake (south shore of the lake). To begin with, a 4-inch casing was used, but this apparently proved unsatisfactory, as after getting down some 40 feet in the surface wash the hole was abandoned. It was decided not to resume drilling until a supply of 10-inch casing was secured. Pending the arrival of this casing an attempt is being made to sink a shaft through the surface gravels and clays to bed-rock. The depth of the surface wash covering bed-rock is not known, but it may be considerable.

Vicinity of Hazelton.—Late in the fall a large number of oil leases were staked in the Skeena and Kispiox valleys, starting from about 10 miles north of Hazelton and reaching up to the Second Cabin, a distance of some 50 miles from Hazelton. Practically all of these leases have been applied for by Hazelton people. During the first week in November an attempt was made by an oil geologist from Edmonton to examine the ground, but owing to snow it was impossible to see much. It is expected that a complete examination of the field will be made next summer.

Discussion.—Before considering the geologic evidence regarding the possibility of oil in this district generally, it will be well to state briefly the usually accepted criteria which are con-

sidered as indicating a possible oilfield. First of all, three fundamental requirements must be filled, which are: (1) A sedimentary formation which at the time of its deposition contained sufficient animal or vegetable life (or both) to be a source of oil in appreciable quantities; (2) a rock formation which is sufficiently porous to act as a reservoir for the oil; (3) a rock formation which is sufficiently impervious to liquids to act as a seal to hold the oil in its reservoir and prevent its escape to the surface.

Given these prerequisites, then comes a consideration of the possible field as regards structure, which is determined by detail geologic mapping, and this information as to structure determines the most favourable places for drilling.

A definite seepage of crude oil is evidence that the underlying rock formations contain oil.

The rock formations which have been recognized in the country stretching from Hazelton to the Francois Lake-Burns Lake section in descending time-order are:—

Quaternary	Superficial deposits	Sand, gravel, clay, etc.
Tertiary	Volcanic rocks and possibly small amounts of sediments	Principally olivine basalt, but including other volcanics, sandstones, and shales.
Jurassic to Post-Lower Cretaceous	Coast Range batholithic rocks	Granite, granodiorite, diorite, and porphyritic rocks.
Lower Cretaceous	Skeena formation	Sandstones, conglomerates, shales, and coal-seams.
Upper Jurassic to Lower Cretaceous(?)	Hazelton formation	Sedimentary, volcanic, and tufaceous rocks. Sometimes volcanics and sediments separate and sometimes interbedded and intercalated.

The above formations have been studied and in places mapped by the following officers of the Geological Survey: Dawson, McConnell, Leach, Malloch, MacKenzie, and O'Neill. It is, of course, possible that in this large expanse of country other formations will yet be identified, but for the present the only known formations are the above-mentioned ones.

The sedimentary measures in the above list are those of the Tertiary, Skeena formation and Hazelton formation. The Tertiary sediments are negligible in quantity and so need not be further considered.

The Skeena formation is the coal-bearing series of the Telkwa, Morice, Zymoetz, Bulkley, Skeena, and Kispiox valleys and of the Groundhog coalfield. It is believed to be, at least in part, conformable with the underlying Hazelton formation and is generally placed as being of Lower Cretaceous age, although fossil evidence is by no means as satisfactory as is desirable. Inasmuch as this formation is coal-bearing and as no horizons yielding a great abundance of marine fossils have been found in it, the conclusion must be that it is not a highly promising formation in which to expect that oil in commercial quantities has been formed.

The Hazelton formation has a very widespread occurrence throughout the district and undoubtedly enormous thicknesses of these rocks exist at different places. This formation, which consists of sedimentary, volcanic and tufaceous rocks, is as a rule more or less metamorphosed. It has apparently suffered some regional metamorphism, and in addition, where in close proximity to the intrusive Coast Range batholithic rocks, has undergone extreme local metamorphism. The age of this formation is doubtful, but the evidence would seem to indicate an age ranging from Upper Jurassic to Lower Cretaceous.

The sedimentary measures of the Hazelton formation are in part interbedded with the volcanic members and ash rocks, but in places there are considerable thicknesses of sediments with the volcanics entirely missing. These sediments consist of sandstones and shales, but in places they are so metamorphosed as to be quartzite, argillites, slates, etc. Plant remains are plentiful in places in these measures, but as yet no horizon containing an abundance of marine fossils has been discovered. The absence of well-preserved marine fossils throughout the Hazelton formation is conclusively shown by the inability of the officers of the Geological Survey to obtain definite fossil evidence of the exact age of this information. In this connection, however, it must be remembered that detail geologic work has only been done in certain small parts of the area under discussion. In the great thicknesses of the sedimentary members of the Hazelton formation there may well be highly fossiliferous horizons which have not yet been observed.

In the immediate vicinity of Burns lake rock-exposures are somewhat scattered, as a great deal of the surface is covered by soil, clay, etc. The rocks that are exposed would seem to be mainly Hazelton formation, with a considerable percentage of intrusive rocks in the form of dykes or stocks which may or may not also belong to this formation. The rocks believed to be Hazelton formation rocks are volcanics, tufaceous rocks, argillites, and possibly some sandstones.

In the vicinity of Francois lake Dawson classified the formations exposed as belonging to the Porphyrite series. This name described a series of dominantly volcanic rocks which form the lower horizon of the Hazelton formation. The name "Hazelton formation" was applied by Leach to replace Dawson's "Porphyrite group," the name to include the whole conformable series of volcanics and sediments.

Reviewing the available literature regarding the Burns Lake-Francois Lake area, it would seem that the rock formations of this area are mainly volcanic and tufaceous measures, with some metamorphic sediments—not a promising area, therefore, for oil prospecting.

In this connection it may be pointed out that one supposed evidence of oil in this area, which has locally been supposed to be of importance, consists of gas-bubbles rising around the shores of Burns, Francois, and other smaller lakes. It is fairly evident, however, that this gas is only marsh-gas arising from the decaying vegetation such as can be seen around almost any swamp. Thin films of iridescent iron oxide and traces of vegetable-oil on swamps similarly are not evidence of underlying oil reservoirs.

An excellent reconnaissance report on the country lying between Hazelton and the Groundhog coalfield is contained in G. S. Malloch's report on the Groundhog field in the 1912 Summary Report of the Geological Survey. From this report it is apparent that the Hazelton formation is practically continuous from Hazelton to the Groundhog coalfield, and that in places, particularly in the coalfield, it is conformably overlain by the Skeena coal-bearing series. Going northerly from Hazelton, the volcanic flows of the Hazelton formation gradually disappear, giving way to tufaceous rocks, and finally these fade out and the formation consists almost entirely of sedimentary measures. Plant remains are abundant throughout the formation and a marine horizon yielding poorly preserved fossils was recognized near the base of the upper third of the formation. Quoting from the report: "The top of the Hazelton formation in the measured section consists of grey shales with larger grains of black shaly material and often divided by thin lines of bituminous matter parallel to the bedding-planes; shales predominate throughout, and no great amount of tufaceous material is present except at the base of the section, which ended with a bed of tufaceous sandstone 40 feet thick."

From the foregoing it is apparent that in the country lying north of Hazelton to the Groundhog coalfield there is a large area of sedimentary rocks, but the question of whether or not these rocks contain any horizons which would be probable sources of oil awaits more detail examination.

For the present the question of a source of oil in the rocks of this district is the important one, as the considerations of suitable reservoir and cap-rocks are of secondary importance. It is probable, however, that such suitable containing horizons would be found. Anticlinal and dome structures are, of course, frequently observed in the formations of this district, as the mountain-building forces have produced much folding and also faulting of the measures.

So far as is known, no definite seepages of crude oil have been found anywhere throughout the district.

Fraser Lake Section.

Fraser Lake Coal.

The occurrence of coal of a lignitic variety along the southern shore of Fraser lake has been known for many years. In the summer of 1920 a number of coal leases were staked by T. J. Kettyle, covering some coal-outcrops about 2 miles from the eastern end of Fraser lake and situated close to the edge of the lake on the southern side. Owing to the coal reserve in force at that time these leases were not secured at once, but it is believed that they are now granted. A company known as the Fraser Lake Collieries, Limited, was formed to take over these leases, and some development was carried out last year and the first part of 1921. The stock of the company was subscribed for locally by residents of Endako, Fort Fraser, and other towns in the district. Mr. Kettyle has been in charge of the preliminary work of the company.

The coal formation consists of shales, some sandstone, and thin bands of lignite separated by shale-partings of varying thickness. The whole formation appears soft and crumbly and from its general appearance looks like a comparatively recent one. The bands of lignite vary from a few inches up to 2 feet in thickness, but in places there is from 4 to 5 feet of coal and shale bands bedded together.

Three shafts have been sunk, which are 28, 38, and 12 feet deep. The first two shafts pass through coal-bearing strata in which there are alternate bands of coal and black shale. The third shaft has not yet reached any coal-bands. The best section of coal which was seen in the shafts was 5 feet, of which 13 inches was shale occurring in four bands.

The following samples were taken:—

Description.	Moisture.	Vol. Com. Matter.	Fixed Carbon.	Ash.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Across 5 feet of coal-seam, excluding 13 inches of shale	13.7	29.8	29.8	26.7
Grab sample from dump, No. 1 shaft	17.2	36.9	34.2	11.7
Grab sample from dump, No. 2 shaft	5.1	19.7	49.8	25.4

The area of coal formation exposed at this point is apparently not extensive. The railway closely parallels the lake-shore at this point and affords a good section of the formation in a number of rock-cuts. The coal-outcroppings are only a few hundred feet from the railway. To the west of the coal formation a short distance a rock-cut on the railway shows a massive granitic rock, while to the east of the showings there are basaltic dykes making intrusive contacts with the sedimentary formation. Still farther east volcanic ash and tufaceous rocks come in. The actual area of coal formation that can be seen is quite small, although the field may have an extension to the south—that is, away from the lake.

The property was examined in August and it is not known if further development has been carried out since that time. If development of the property is to be carried out, the first thing that should be done is to make a thorough geologic examination of the surface to see if the possible coal area is sufficient to justify underground development. The analyses of the coal show that on the average it would be classed as a lignite, and, further, that the percentage of ash is somewhat high.

Iron-ore Showings South of Vanderhoof.

An occurrence of hæmatite-iron ore, which had been reported to be of some importance, in the vicinity of Finger lake was examined during the field season. It is to be regretted that the size of the deposit was found to be much smaller than had been expected and that the showings are not particularly promising. The showings are situated on a small hill on the north side of Finger lake and are distant about 40 miles from Vanderhoof. The present route into this section is somewhat roundabout and consists of about 20 miles of road and about 30 miles of trail, the last 10 of which is a very indifferent one. The country is of the plateau type characteristic of the Nechako plateau. The rock formations as noted on the trail going into Finger lake are almost entirely igneous, a considerable percentage being volcanic rocks. The occurrence of iron ore, although not promising in itself, is of such a nature as to indicate that this section may have possibilities for the prospector in looking for other minerals than iron. Briefly, the iron ore occurs as hæmatite and specularite in sheared zones and is an example of the type of magmatically deposited mineral occurrence, to which type it is now almost universally agreed that most of our sulphide ore-bodies belong. Hæmatite and specularite are minerals which have been deposited under fairly high temperature and pressure conditions from aqueous and gaseous solutions. Such solutions would very possibly carry sulphides, such as galena, zinc-blende, chalcopyrite, and pyrite, which minerals would be deposited under lower temperature and pressure conditions than the iron minerals. Somewhere in the vicinity of these iron occurrences, therefore, there is a possibility of there being other mineral-deposits.

The *Iron Mountain* group of mineral claims has been located to include these iron-showings; the claims are owned by Joseph Murray, R. C. McCorkell, George Ogston, Ernie Mitchell, J. G. Watt, and Hugh Wilson. The elevation of the top of Iron mountain, which is the local name

applied to the hill on which the iron-showings occur, is 4,000 feet, while the elevation of Finger lake is 3,000 feet.

The rock formations exposed on Iron mountain consist entirely of volcanic rocks, the principal types being felsite, diabase, and andesite. These rocks are in part porphyritic and in places consist of volcanic breccias.

Sheared and sheeted zones have been developed along certain lines in these rocks, the line of strike varying from north and south to east and west. In these zones small stringers and bunches of hæmatite have been deposited, apparently by replacement action. The stringers of solid hæmatite are only a few inches wide, and in addition there is a certain amount of disseminated ore. This material, which forms a typical ore breccia, occurs in widths up to 2 to 3 feet, but is not continuous for any great length. The only other mineral seen besides hæmatite and specularite was in one place some minute cubes of pyrite. Surface cuts have been made in many places over the hill, but the general nature of the iron-showings is much the same wherever it is exposed.

The pure solid hæmatite is good-grade iron ore and free from impurities. The brecciated ore is low grade from admixture of felsitic rock and will run from 20 to 30 per cent. iron. Unless very much larger bodies of the solid hæmatite are found by further development the deposit is not of commercial importance at the present time.

The discovery of this iron was made by Joseph Murray and he has put in a good deal of time in digging holes to uncover the showings. Mr. Murray has a good cabin near the foot of Iron mountain, at the edge of the lake, and usually spends the winter in trapping in this district.

CARIBOO MINING DIVISION.

It is pleasing to be able to report that in the old Cariboo District (which includes the Cariboo and Quesnel Mining Divisions) there was no cessation of mining activity during the year 1921, and contrary to most mining districts throughout North America, an increased production was made as compared with the preceding year. The chief reason for this is that the main product of mining operations in the Cariboo is gold, and during 1921 the onerous conditions which militated against the gold-miner during the war years began to be somewhat alleviated. The result was that renewed interest in gold-mining has taken place, especially as the depressed market prices of other metals tended to discourage the mining of these metals. The full effect of lowering prices and general costs has not yet been manifested in the Cariboo District, so that it is reasonable to expect that during 1922 a further increase of production from this district will take place.

The mineral production of the Cariboo District up to the present time has consisted almost entirely of placer gold. From time to time during the last forty years efforts have been made to mine some of the quartz veins, which are very numerous in different parts of the district. While some gold has been produced in this way, none of the attempts at lode-mining have been successful in producing a mine which has continued in operation for long. Rich pockets of gold quartz have been taken out, but no continuous operation has resulted. It would appear that now is a favourable time for a reconsideration of the possibilities of some of these properties. Wages and other costs are reasonable and railway transportation is much closer than in former years. During the summer the Pacific Great Eastern Railway was completed to Quesnel and steel is laid some 18 miles northerly towards Prince George.

One of the important events of the year in this district was the reopening of the famous *Bullion* mine, which is situated a few miles from Quesnel Forks. This mine was a big producer under the management of the late John Hobson, but since about 1912 has been tied up in litigation. At one time the property was magnificently equipped with water systems and everything necessary for large-scale hydraulic operations. As might have been expected, the ditch-lines, flumes, etc., have deteriorated very considerably and some time and considerable capital will be required to re-equip the property. Reconstruction-work was started this summer and it is hoped to have the property in shape for operation during the season of 1922.

The completion of the hydraulic plant on the *Kitchener* mine on Keithley creek was accomplished during the early part of the summer and piping was carried on steadily until the freeze-up in the winter. During this season and probably part of next one drifted ground was piped, but still fair "pay" is being recovered. It is expected that when the pit advances to virgin ground some rich "pay" will be obtained.

All the usually operated hydraulic mines were worked during the season and a considerable amount of small-scale work by individuals was carried on. Testing of certain areas for dredging or hydraulic installations were carried out in certain places and in some of these the results were highly satisfactory.

The production of placer gold for the year is estimated at $67,400, which compares with $66,000 in the preceding year.

The season was a fairly satisfactory one for the hydraulic miners, for although there was a considerable dry spell in the middle of the season, when there was no water for piping, this was compensated by an extra long run in the fall, due to excessive rain and mild weather. It was, in fact, an exceptionally long hydraulic season, but operators did not secure the best results from the water owing to their fear that the rains were not going to last, and consequently preparations were not made for it.

Late in the fall considerable excitement was created by the report of a new rich strike on Cedar creek, a small stream which flows into Quesnel lake a few miles above Quesnel dam. This discovery was not examined by the writer, but under the heading of "Cedar Creek" will be found a short report by the Gold Commissioner, in which some details of the new strike are given.

Although a good deal of the Cariboo District has been fairly closely prospected for placer-ground, there is still a possibility of some rich creeks still existing which have not been discovered; and without doubt there is much virgin ground yet to be worked on the old well-known, formerly-worked placer creeks. Besides these possibilities there are large areas of low-grade ground throughout the district which will in time be worked.

Barkerville Section.

Hopp Mines. Of the placer properties controlled and operated by John Hopp in the vicinity of Barkerville, two were operated during the season; these were *Lowhee* and *Mosquito Creek*. The operations at Lowhee were more satisfactory than in recent years and a good season's clean-up was reported. At Mosquito creek the water-supply is always limited, but the long season of water helped considerably this year. Practically no work was done at Stouts gulch this year, this property being apparently about worked out. The Hopp properties were managed during the year by L. Muller.

Waverly. Piping was carried on practically continuously at this property from May until November. This is an old hydraulic mine on Grouse creek, which was reopened last year and is being worked under the supervision of C. W. Moore. The work so far done has consisted of dead-work in opening up a long bed-rock drive to attack the channel at a point considerably below the old workings. It is not believed that much return was received from the piping operations this year, but at the end of the season it was believed that the pay-channel was being reached.

Point.—This property, which is situated on Slough creek and is owned by a Chinese syndicate, was operated as usual and a satisfactory clean-up is reported.

Perkins Gulch.—This property is situated a short distance from the town of Stanley and is owned by Felker, Sparks & Fraser. They report a successful season's operations.

Other Placer Properties.—Small-scale work was carried out by J. McDougall on Devil's Canyon creek, E. L. Houser on Antler Creek, A. F. Brown on Cunningham creek, Leopold Muller on Dragon creek, Moore & Stevens on Walker's gulch, and other individuals in different parts of the section.

Proserpine Mountain.

Prospecting, assessment-work, and development of a number of the quartz properties on Proserpine mountain was carried out during the year by various owners. Seymour Baker and Saunders did considerable work on their properties.

The properties owned by Armstrong, Tregillus, and partners have not had much work done on them since the Bryce Syndicate relinquished its bond in the spring of 1920. It is believed that these properties, which have been described in detail in previous Annual Reports, would warrant further exploration, as the results attained by the Bryce syndicate were not sufficiently conclusive to definitely settle the matter. Apparently this syndicate considered that the whole veins, quartz lenses and associated schist, would have to stand up to low-grade milling

Finger Lake, Cariboo M.D.

UNIVERSITY OF ILLINOIS LIBRARY

ore, or the property was not promising enough to go ahead with. It would seem, however, that portions of the veins might pay to work and other portions are practically barren of gold values. With the favourable conditions now existing for gold-mining, an examination and thorough sampling of these properties is strongly recommended to any one looking for gold properties.

Cottonwood River.

The testing of a group of leases on the Cottonwood river which are owned by a California syndicate was commenced this year. Some pits were sunk and a drill was operated a short time. It is believed that one hole was put down with the drill, but that bed-rock was not reached. When the writer was in the district in August the work had been stopped and the representatives of the company had left. It is claimed, however, that they are satisfied with the testing carried out and that a dredge of some type will be erected to mine the ground.

Farther up the Cottonwood river, some 16 miles from the mouth and about 15 miles from Quesnel, N. G. Larsson has been engaged for the last three years in prospecting a number of placer leases. Good values are found in the surface gravels at a number of places on the property. The leases cover considerable deposits of gravel stretching for about a mile up-stream from the commencement of a rocky canyon on the river. The gravels are apparently of Post-Glacial origin and represent old bars of the river which have been more or less concentrated by the damming action of the bed-rock spur, through which the river has been forced to cut a canyon.

The work done by Larsson consists of surface pits, but owing to water it has been impossible to go down more than 6 or 8 feet in the gravel. The depth to bed-rock is unknown, but in many places it will probably be 30 feet or more. The surface prospects are sufficiently encouraging to warrant the further exploration of the ground by drilling or some other method. It is probable that the only method of working the ground would be by some form of dredging.

Peters Creek. In the fall of the year a syndicate made up of several members of the staff of the Northern Construction Company at Quesnel obtained an option on the old Mathers property on Peters creek. This property was a producer some years ago and it is believed there is much workable pay-ground in the property yet. This is a drifting proposition, the ground being reached by a shaft. Hoisting was done by a water-wheel driven by the water from the creek. The old machinery, flumes, etc., were found to be in fairly good repair and by the end of the year the plant was put in shape for operation and actual mining commenced.

The property will be worked all winter with a force of from six to eight men. About the end of January (1922) it was reported that good pay-ground had been struck and that operations were proceeding very satisfactorily.

La Fontaine. This mine is situated on Lightning creek, about 1½ miles below the town of Stanley. The property was extensively worked some years ago by means of a bed-rock shaft in the rim and bed-rock drifting below the present bed of Lightning creek. The drifts were broken through to the bed-rock gravels wherever desirable and the whole stream-bed for some distance up and down the creek thoroughly tested. At that time the property was well equipped with hoisting machinery, pumps, etc., all driven by steam.

It was finally decided that the proposition was fully tested and that the bed-rock gravels were not rich enough to work, and work was stopped. Subsequently the property was acquired by L. A. Bonner, who moved the machinery to another property he was working.

After studying the whole evidence carefully Mr. Bonner reached the conclusion that the rich lead of Lightning creek which was worked for about 3 miles (above and below the town of Stanley) would not be found in the present channel of Lightning creek at the *La Fontaine* workings. That is to say, the Tertiary channel of Lightning creek is not followed by the present channel of Lightning creek where it goes through *La Fontaine* ground. Mr. Bonner believes, and adduces considerable evidence to support his theory, that the old Tertiary channel and accompanying rich "lead" lies in the right bank of the present stream-channel. Some Keystone-drilling done by Mr. Bonner a few years ago across the supposed line of the old channel apparently shows that there is a channel at this point.

Mr. Bonner considers that if an old channel can be proven at this point it is a reasonable speculation to explore this channel by deep-drifting methods to find a possible continuation of the rich "lead" of Lightning creek. It should be mentioned here that the rich "pay" of

Lightning creek in the vicinity of Stanley was contained in a well-defined "lead," of apparent Tertiary age, consisting of highly auriferous gravel.

In order to get financial assistance in his project, Mr. Bonner finds it necessary to first of all demonstrate that there is such a channel lying under the hill and to the right of the present stream-bed of Lightning creek. Mr. Bonner therefore asked the Government to do some further Keystone-drilling to prove the correctness or otherwise of his theory regarding an old channel, but agreed to put up the entire expense of this work. In this way Mr. Bonner will secure an official report regarding his project and any possible criticism of the drilling being affected by being done by the owner will be eliminated.

Under this plan the drilling was started about the end of December. C. W. Moore, an experienced hydraulic miner and Keystone-drill operator, was placed in charge of the work at the drill. It is expected that two or three months will suffice to do the required drilling to settle whether or not there is an old channel at this point. In the event of such a channel being proven, Mr. Bonner has practically arranged for the necessary capital from England to carry out the exploration of the channel.

QUESNEL MINING DIVISION.

Quesnel River Section.

Further work was carried out this summer by the Cariboo Gold-Platinum Extracting Company on its property on the Quesnel river, situated 15 miles above the town of Quesnel. A scraper-dredge type of plant erected on the property in 1920 was operated during this summer. The work this year was more in the nature of experimental test runs to determine the efficacy of the plant to save the fine gold- and platinum-bearing black sands that occur in the gravels. Just what results were attained by the company this year are not known. S. J. Marsh is in charge of the work.

Bullion.

It has been mentioned in the general remarks that the *Bullion* mine was reopened this year. An excellent report on this property by W. Fleet Robertson can be found in the Annual Report of the Minister of Mines for the year 1902. It will be interesting to review very briefly the history of this property. Under the guidance of the late John B. Hobson, the mine was thoroughly equipped and made the most important hydraulic-mining enterprise in British Columbia. Thirty-three miles of well-constructed ditches and accompanying dams, reservoirs, and flumes comprised the water system, which was capable of delivering at the mine 5,000 miners' inches of water under a head of 420 feet. The property was worked until 1906 with Mr. Hobson in charge, when the control was taken over by the Guggenheim Exploration Company. In 1907 this company stopped operation of the mine and never resumed. In 1912, on the assumption that the property had been abandoned and therefore reverted to the Crown, it was staked by John Hopp. At about the same time the Guggenheim interests sold the property to R. T. Ward. A famous lawsuit thereupon ensued, which finally resulted in the Privy Council giving the decision in favour of Ward in 1919. In his purchase of the property and subsequent litigation Ward was backed by various interests. Later some friction and resulting lawsuits occurred between the various backers of Ward. Just how the ownership stands at present is not known to the writer, but a syndicate which apparently has possession is now actively engaged in putting the property in shape for operation.

The bed-rock tunnel which Hobson commenced in order to give better dumping facilities for the hydraulic pit is being driven ahead, and a shaft at the head of the pit is being sunk to meet this tunnel. A great deal of work will be required to put the old ditch-lines, flumes, pipe-lines, etc., into good condition again, and this work has also been started. Considerable capital is required to re-equip the property, as much deterioration has taken place during the long period of idleness. It is hoped to have the water system sufficiently repaired so that some piping can be carried on next season.

It is believed that there is still a considerable yardage of pay-gravels ahead of the old pit which can be mined at a profit.

Group. Copper Queen

This group consists of the *Copper Queen*, *Diamond*, and *Blackbird* claims and is owned by George Adams, D. D. Fraser, and Fred Gingras. The property is situated on the Quesnel river about 30 miles from the town of Quesnel; the claims being at a distance of 2 or 3 miles from the Quesnel river on the

north-easterly bank. The property can be reached by trail from Quesnel on the north side of the river, or by the Dragon Lake road to the 25-Mile ferry on the Quesnel river, and thence by trail. The last few miles to the property there is practically no trail, but it is fairly open country and a horse can be ridden almost anywhere. The nearest point to the property for accommodation is Bastion's ranch, which is about 5 miles distant down the river. The showings are on the top of a small knoll slightly higher than the surrounding country, at an elevation of 3,700 feet.

The rock formation exposed on the property is a dark green-coloured igneous rock somewhat metamorphosed which might be classified as an augite porphyrite. In this formation there is a band of schist which would seem to represent a line of shearing in the porphyrite which has caused a zone of pronounced schistosity. In this schistose zone there is a fairly well-defined quartz-filled fissure which forms the showing on the property. The schistose band is from 10 to 20 feet wide, while the quartz vein is from 1 to 2½ feet in width. In one of the showings the quartz vein is split up into a number of inch-stringers spaced through the schist.

The principal development-work on the property is a large incline shaft 20 feet deep. The vein strikes north and south (mag.) and dips at 30° to the east. The valuable minerals contained in the quartz gangue are tetrahedrite and at the surface azurite, which has resulted from the oxidation of the sulphide. A little chalcopyrite was noted in one place. As disclosed by the incline, the vein is clearly defined and varies from 1 to 2 feet in width. The following table shows the values obtained from sampling:—

Description.	Gold.	Silver.	Copper.
	Oz.	Oz.	Per Cent.
Across 2 feet of vein at foot of incline (full width of vein).	Trace.	Trace.	2.1
Across 26 inches of vein at point 10 feet above bottom of incline	0.02	16.4	4.2
Average grab sample of dump	Trace.	10.6	3.2
Selected high-grade ore; represents hand-sorted ore	0.08	44.2	12.2
Quartz from stringers on lower showing	Trace.	Trace.	*Nil.*

Samples of the schist enclosing the quartz vein showed no appreciable values. This vein crops at different points on the hill for a few hundred feet, but the best showing is at the point where the incline shaft was started.

Keithley Section.

The name "Keithley section" embraces the country lying on and around Keithley, Snowshoe, Little Snowshoe, and other creeks and Cariboo lake. Placer-mining was commenced in this section many years ago, the earliest workings being prior to those of the Barkerville section. Mining has been carried on more or less continuously ever since, but in recent years the production has been quite small. The most important workings were on Keithley creek, from which a considerable production has been recorded. Much gold was taken out of the present creek-bed of Keithley creek by cleaning up the stream-gravels to bed-rock. In addition, a high channel on the bench on the north-east side of the stream has been worked and in places yielded very rich "pay." This channel is undoubtedly an old pre-glacial channel capped over and filled in by glacial and stream gravels and talus material. It lies about 100 feet above the present creek-bed and is only a short distance away from it. This channel has been worked in a number of places, but the channel would seem to be somewhat disconnected and irregular.

Kitchener. This property is situated on Keithley creek, about a mile above the mouth. The owners were Harrison & Worth, who worked the property as a drift-digging for five or six years. In 1920 control of the property was acquired by a syndicate formed by some of the directors of the Quesnel Hydraulic Gold Mining Company. This company has been operating a large hydraulic mine at Hydraulic, on the Quesnel river, with K. C. Laylander in charge as superintendent. On acquiring the property in 1920 a small ditch-line was put on from 4-Mile creek, but little or no piping was accomplished. This year (1921) the company's plant at Hydraulic was not in operation, so Mr. Laylander took active charge of the *Kitchener* mine and equipped the property with a good hydraulic plant.

Water from Keithley creek was laid on by means of a 4½-mile ditch, which included some fluming and a siphon. The ditch from 4-Mile creek connects with the large ditch, so that an ample water-supply is assured. The water from 4-Mile creek is expected to start earlier in the spring than the Keithley water, thus giving an earlier start at piping. The plant will deliver 2,000 miners' inches of water at a head of 309 feet, but in actual operation only about 1,500 inches is being used.

The ground that is being worked on the *Kitchener* mine is part of the old pre-glacial bench channel of Keithley creek. It is ideally situated for hydraulicking, as there is a 100-foot dump into the creek from the end of the flume. The depth of ground to be worked off is from 50 to 100 feet. The rich pay-gravel is on and near bed-rock and consists of pre-glacial gold-bearing gravels. Capping this are glacial gravels and clays which may contain a little fine gold. In the drift-workings of Harrison & Worth ground running from 2 to 5 oz. to the set (8- to 10-foot caps) was taken out.

The property has been well equipped with camp buildings, shops, etc., and everything required for efficient operation. A small air-compressor supplies power for air-drills used in drilling boulders, which are then broken up by blasting. The camp is electrically lighted and powerful search-lights placed in the hydraulic pit allow of continuous operation of piping during the twenty-four hours. Keithley creek under normal conditions carries a large stream of water and, except in rare instances of a prolonged dry spell, will provide ample for water for hydraulic operations. The hydraulic season at this property should last for six or sexen months each year. Only a short flume is required to carry off the tailings, so that the expense of flume, blocks, etc., is at about a minimum. Somewhere about $90,000 has been expended in equipping the property.

The ground piped off this season was ground that had been drifted by Harrison & Worth, and large returns were not to be expected, but the pit should be advanced into virgin ground next season, when good returns are confidently expected.

Horsefly Section (Harpers Camp).

The writer did not visit Horsefly (Harpers Camp has been officially renamed as Horsefly) this year, but has heard that a certain amount of prospecting of the ground in the vicinity of Ward's Horsefly has been carried on by R. Campbell and partners. Some of this work was on the bench across the river, where the Keystone-drilling was done last year by the British Columbia Government. It is reported that fair values have been obtained, much better, in fact, than was indicated by the drilling of the ground. Values of from 25 cents to $1 a yard, as reported by Campbell, would make this good ground if it could be worked by hydraulicking or dredging. These values are reported as being found in prospect-pits that were sunk, and as such the results should be considered as decidedly encouraging. Just why the Keystone-drill results should be so much lower is not apparent, but the matter is considered of sufficient importance to the public to warrant giving all possible information bearing on the value of the ground.

Cedar Creek.

There has been some excitement created this past fall over reported finds of gold on Cedar creek. The writer has been unable to investigate these personally, but the following information is given as it was obtained from men who have been working and prospecting on the ground.

Cedar creek is a small stream which flows into Quesnel lake on the north side, about 3 miles up the lake from the old dam at its outlet, and heads near Spanish lake, but over a divide therefrom.

There is a stage-road from the main Cariboo road at 158-Mile House into Quesnel Forks, and to the old Hobson pit at Bullion, on the Quesnel river, and to the dam on Quesnel lake, while there was an old road from Quesnel Forks, on the north-east side of the river, to the mouth of Cedar creek.

From this, it will be seen, transportation to the camp is easy and reasonably cheap, as placer camps go, which should make operating and living expenses reasonable.

It is possibly too soon to predict whether the discoveries or rediscoveries in the camp will prove important channels, or whether they are only remnants of old channels.

As to the probabilities of the section: The general course of Quesnel lake is east and west, while the 5 miles of the lake from the outlet takes a sudden bend to the north-west in direct

line with the Quesnel river to the Forks, which has been gold-bearing. The old gold-bearing channel at Bullion undoubtedly followed the general trend of this part of the Quesnel river, and the Bullion pit is about midway between Cedar creek and the Forks. There is therefore a distinct possibility of there being an important old channel, following the usual south-east trend of placer-drift, possibly extending at least as far as Cedar creek.

The old dam has recently been partially blown up with dynamite and has so lowered the level of Quesnel lake, exposing a bar at the mouth of Cedar creek.

According to the statements of a syndicate which has been working at this point, they found an old channel near lake-level which was bounded on the north-east by a hard rim-rock, through which Cedar creek had broken. From this channel the syndicate brought out some very coarse gold, somewhat similar to the old Bullion product, and this channel is about on a level to coincide with the Bullion channel.

Assuming this information to be correct, it would appear possible that the supposed channel found near lake-level was of a different origin from the gold found higher up Cedar creek, and described in a report received from Mr. Dodd, the Gold Commissioner, which is given herewith. If Mr. Dodd's information is correct, it would seem that the Lyne-Platt findings have not as yet been proved as a continuing channel; but if their figures as to the product of the 50-foot cut are even nearly correct, it would show over $40 a cubic yard in this cut.

These remarks are intended to give an idea of the possibilities of the section rather than as actualities proven by the work so far done.

Following is a report by L. A. Dodd, Gold Commissioner at Barkerville, on the gold strike which was made late in the season at Cedar creek:—

"In accordance with your instructions, I left here on the morning of the November 2nd, via Quesnel for Quesnel dam, as Cedar creek runs into Quesnel lake about 3 miles above the dam. The 'discovery' is about 1½ miles up the creek on its left bank and perhaps some 700 or 800 feet higher than the lake. I found Lyne & Platt, the discoverers, on the ground, in addition to some half a dozen others. Two comfortable cabins have been erected. Mr. Lyne showed me all over their locations, including the pits where they have been working. No work was being carried on during the time of my visit, Mr. Platt being ill.

"These pits, two in number, are about 50 feet long, 4 to 5 feet wide, and less than 3 feet in depth, and from them some 60 oz. of gold had been taken out. Shortly above the second pit (from the creek) the ground takes a sharp rise, and so far no trace of the run of gold has been found in it, though a great number of holes have been sunk in all the draws in the neighbourhood. An effort to drain some of this deeper ground made by the locators on the back locations is being carried on. In digging the drain some fine gold was found until the ground commenced to get over 6 feet deep, after which no traces of gold have been discovered. This drain starts in the Lyne & Platt ground.

"All the ground is very heavily covered by second-growth timber and one could only get around by following paths cut by the prospectors and along the location-lines. I followed these location-lines back a distance of over 6,600 feet from the creek, much farther than where any work had been done, and it would appear to me that the overburden, with the exception of a short portion of the Lyne & Platt locations, runs all the way from 25 to 75 feet deep, which means that the ground cannot be worked advantageously except by hydraulicking. Lyne & Platt have been using the seepage-water for rockers. This is sufficient for this purpose for a short portion of the season only, there being practically no water when the weather is dry.

"Lyne & Platt informed me that they had been looking for the discovery since May last; Mr. Lyne, who is a native of the district, having been informed by an old-timer that gold should exist about where they found it, which is some distance above the old Cedar Creek workings. They do not consider they have made wages during the time they have been engaged in the area.

"The nearest stream of water, I am informed, which might be used for hydraulicking is Rapid river, which would necessitate a ditch-line some 12 to 15 miles in length. It would appear to me that there might also be some possibility that the ground might be dredged, provided the seepage-water could be utilized and is found in sufficient quantities to float a dredger, there being quite a large muskeg off to one side, from which Cedar creek flows.

"From inquiries made to persons conversant with the area as a whole, it appears that discoveries of similar 'spots' have been made for many years in that locality."

PEACE RIVER DIVISION.

The Peace River Division lies to the east of the divide of the Rocky mountains, and most of the area from a geologic and topographic view-point lies in the physiographic subdivision of Canada known as the Great Plains. With the exception of the small part of the Division embracing the watershed and foot-hills of the Rocky mountains, the country consists of a plateau area in which the dominant rock formations are sedimentary measures of Cretaceous age.

So far as yet reported, but few occurrences of minerals in-place are known in the Division. It is possible that in the Rocky mountains important ore-bodies may yet be discovered. The area, however, has important and valuable resources in placer gold and coal, and very probably in petroleum. These will be discussed under their respective heads.

PLACER GOLD.

For many years past it has been known that the sands and gravels of the Peace, Finlay, Ingenika, and other rivers in the Peace River Division are gold-bearing. This gold is, as a rule, fine, and some at least of it may be classified as flour gold. As would be expected, the gold content of the gravels varies greatly, and only at certain places along these rivers is the ground rich enough to be considered to be workable. There are, however, believed to be many areas in which the gold content is probably sufficient to make the gravels desirable dredging-ground. In some places natural concentrations, as on bars, etc., have been worked on a small scale with rockers by individuals, but no large production has been made. During the past few years, however, a number of companies have been testing certain areas with a view to installing dredges for working the ground, and it is expected that some of these projects will before long reach the production stage.

The Tanisto Mining and Development Company, Limited, commenced the testing of a number of placer leases on the Ingenika river in 1920 with a drilling outfit. The results were reported to be satisfactory and further work was carried on in 1921, but the results of this year's work are not known.

The Peace River Gold Dredging Company has a number of leases on the Peace river and testing of this ground has been carried out during the last two years. The results are said to have been satisfactory and the plans for putting a dredge on the property are now being considered.

Several large blocks of leases on the Peace river are held by W. A. Aubin and preparations for testing this ground are under way.

COAL.

Along the Peace river and some of its tributaries there are surface croppings of coal-seams and coal formation which indicate that there is a considerable coalfield in this section. A report on this coalfield was made for this Department in 1912 by C. F. J. Galloway and published in the Annual Report of the Minister of Mines for that year. This report shows that there are cropping out along the Peace river a number of seams of bituminous coal of excellent quality. Analyses of this coal show it to be low in ash and of a composition such as to make it a high-grade steam-coal and also suitable as domestic fuel. The seams described in the above report vary in width from 2 to 4 feet, but larger seams are known to occur in the field.

Practically no development has been done in this coalfield, as up to the present there has been no inducement to do so. Without railway transportation there is, of course, no market for this coal and the development of the field must wait until at least railway-construction is definitely assured. The field is, however, a valuable potential asset and will probably be developed in the near future.

OIL.

During recent years much interest has been aroused over the oil-producing possibilities of the Great Plains, and much exploratory work has been carried out by various companies and individuals and also the Geological Survey of Canada. The Imperial Oil Company has been particularly active in this work and has spent much money in geologic exploration and mapping and well-drilling at various points stretching from the International Boundary-line to Fort Norman, on the Mackenzie river.

While primarily this work commenced in Alberta, it was not long until it was recognized that the Peace River Division of British Columbia presented very considerable promise of success in oil exploration. The Cretaceous and underlying formations are believed to have horizons which may contain oil in commercial quantities, and generally the prospects are as favourable as anywhere in the Great Plains.

The need for geologic information was recognized by the British Columbia Government, and so in 1919 the late Professor J. C. Gwillim was engaged to make a geologic reconnaissance of a portion of the Peace River Division. The report by Professor Gwillim was published in a bulletin entitled "Report of Oil Survey in the Peace River District, 1919." It should be explained here that in British Columbia all coal and oil lands are administered by the Department of Lands and not by the Department of Mines.

In 1920 the oil investigation was continued, certain areas designated by Professor Gwillim being examined in greater detail. This work was done by John A. Dresser and Edmund M. Spieker, and the results are contained in a bulletin entitled "Report of Oil Surveys in the Peace River District, 1920," issued by the British Columbia Department of Lands.

As a result of the reports by Dresser and Spieker it was decided to test certain promising points by diamond-drilling. Such drilling was expected to give important information relative to the formations at these points, depth to certain horizons, and some criteria regarding the presence or otherwise of oil and gas. This drilling was done during the summer of 1921, but as yet no results have been given out.

Late in the year a well being drilled at Rolla, B.C., by the Imperial Oil Company penetrated a formation carrying natural gas and a heavy flow of gas under considerable pressure is now coming from the well. The officials of the company consider this a highly favourable indication and are confident of finding oil in quantity in the lower horizons.

Most of the exploratory work for oil in the Peace River Division has been done in that portion known as the Dominion Peace River Block. In this block the surface land rights are controlled by the Dominion Government, but all mineral rights, including coal, oil, and natural gas, are controlled by the British Columbia Government.

There is a large area in the Peace River Division and in the Liard Division, lying to the north, in which the possibilities of finding oil are favourable and undoubtedly much exploratory work will be carried out in the near future.

CARIBOO DISTRICT.

CARIBOO MINING DISTRICT.

REPORT BY L. A. DODD, GOLD COMMISSIONER.

I have the honour to submit herewith the office statistics for the year ended December 31st, 1921.

OFFICE STATISTICS—CARIBOO MINING DIVISION.

Free miners' certificates issued	211
Mineral claims recorded	93
Certificates of work ("Mineral Act")	62
Placer claims recorded and rerecorded	46
Leaves of absence	11
Powers of attorney recorded	141
Applications for placer-mining leases	177
Placer-mining leases issued	117
Certificates of work ("Placer-mining Act")	100
Conveyances and agreements recorded	125
Leases in force	326

Revenue.

Free miners' certificates	$ 1,550 00
Mining receipts, general	17,223 19
Other sources	1,363 85
Total	$20,137 04

OMINECA AND PEACE RIVER MINING DIVISIONS.

REPORT BY STEPHEN H. HOSKINS, GOLD COMMISSIONER.

I have the honour to forward herewith the office statistics for the Omineca and Peace River Mining Divisions for the year ending December 31st, 1921.

OFFICE STATISTICS—OMINECA AND PEACE RIVER MINING DIVISIONS.

Free miners' certificates (ordinary)	602
Free miners' certificates (company)	7
Free miners' certificates (special)	5
Mineral claims recorded	228
Certificates of work issued	628
Placer claims recorded	5
Bills of sale, mining agreements, etc.	150
Powers of attorney recorded	43
Mining documents filed	44
Certificates of improvements recorded and issued	15
Crown grants of mineral claims issued	15
Applications for placer-mining leases (Omineca Division)	5
Applications for placer-mining leases (Peace River Division)	42
Placer-mining leases issued (Omineca Division)	5
Placer-mining leases issued (Peace River Division)	27

Revenue.

Free miners' certificates	$10,875 55
Mining receipts	3,853 00
Total	$14,728 55

QUESNEL MINING DIVISION.

REPORT BY R. M. MCGUSTY, MINING RECORDER.

I have the honour to submit herewith my report on mining operations in the Quesnel Mining Division of the Cariboo District for the year ending December 31st, 1921.

As in the past, the Resident Mining Engineer is forwarding a report on the various properties throughout this Mining Division.

The improvement in the general outlook for mining in this Division has been more than maintained during the year under review; the placer strike on Cedar creek being to a certain extent responsible for this. Interest, however, in other sections of the district has also been displayed, noticeably in the Keithley and Horsefly placer-gold areas.

The number of applications for mining leases shows a steady increase, being far in excess of any previous year.

OFFICE STATISTICS—QUESNEL MINING DIVISION.

Free miners' certificates issued	179
Mineral claims recorded	17
Certificates of work issued	4
Placer-mining records	10
Placer-mining rerecords	10
Powers of attorney recorded	48
Bills of sale and mining documents	3
Mining-lease applications	91

EASTERN DISTRICT (No. 5).

REPORT BY A. G. LANGLEY, RESIDENT ENGINEER.

(Reports marked * are by B. T. O'Grady, Assistant.)

INTRODUCTORY REMARKS.

The sudden depression in metal prices had a serious effect on many of the principal silver-lead producers, especially in the Slocan, where they had hardly recovered from the "tie-up" caused by the O.B.U. strike of last year.

Many properties throughout the district were forced to temporarily suspend operations, while others were either leased to small operators or continued development on a reduced scale pending more favourable market conditions.

The low price and lack of market for lead and zinc eliminated to a large extent the mining of low-grade ores.

The price of silver, which during the first six months of the year hovered around 59 cents an ounce, began to show strength in July and gradually increased up to 71 cents in October.

In September the Consolidated Mining and Smelting Company of Canada, Limited, called a meeting of the mine-owners at Nelson, at which general conditions appertaining to mining and smelting rates were the chief matters discussed. As a result of this meeting the company decided to make the terms of payment for ores received more acceptable to the mine-owners, and at the same time remodelled their Schedule C. This action of the company, together with the more healthy tone of the silver market, tended to stimulate mining and create a more optimistic sentiment among the silver-lead operators than existed earlier in the year.

Mining activities of leasers, prospectors, and small operators seem to have been on the increase during the last few years and no marked falling-off was noticeable this year; in fact, there has been an increase in gold-prospecting.

The outstanding and surprising feature of the year, in view of the adverse market conditions, is the record production of lead and zinc by the Consolidated Mining and Smelting Company's smelter and refinery at Trail, where over 400,000 tons of ore has been treated during the year. The bulk of this immense tonnage was produced by the *Sullivan* mine. This achievement was made possible by the ability of the company to finance the carrying of large accumulated metal stocks and to improvements in the metallurgical treatment of the complex *Sullivan* ores.

The resultant benefits to the district of maintaining this production have been manifold. Some 2,000 men have had steady employment at the smelter and company's mines, the independent shippers have been afforded smelting facilities, and the numerous dependent communities have been sustained. This is a very pleasant contrast to the conditions prevailing at some of the large mining centres in the United States.

The sensational strike of high-grade gold ore at the *I.X.L.* at Rossland is reminiscent of the early days of the camp, and will no doubt attract attention to other properties which have been lying dormant for a number of years.

The successful application of the flotation process by L. H. Biggar at the *Ottawa* mine to low-grade silver ores suggests greater possibilities for many of the "dry-ore" properties.

Men have been plentiful in the various camps and wages have decreased. In the Slocan miners are getting $4.50 and muckers $4 a day. The production of coal from the Crowsnest collieries shows a slight decrease as compared to that of last year. The cause is attributed principally to lack of demand, the mines having only averaged about 75 per cent. of their working-time.

During the early part of the year a series of lectures on geology, ore-deposits, and mineralogy were given at various mining centres. In this work the writer was afforded the hearty co-operation of the prospectors' associations.

In conclusion, the writer wishes to acknowledge the assistance and courteous treatment received from the mine-owners, prospectors, and members of the Geological Survey.

EAST KOOTENAY DISTRICT.

GOLDEN MINING DIVISION.

The principal producer of this Division—namely, the *Monarch* mine at Field—was not operated this year owing to the unfavourable conditions governing the market for lead ores.

Among prospecting activities it is interesting to note that the gold-quartz properties situated at the head of the Middle fork of the Spillimacheen river, and which have been lying idle for a number of years, again received attention. W. Orville Young had a few men working during the season on the *Boston* and *International* groups.

Some very fine specimens of talc were brought in from Vermilion creek, and it was reported that the claims were bonded to a company which intended to work them, but no authentic information is available at the time of writing.

Wolverine.

This property is owned by P. Bergenham, of Golden, and is situated near the headwaters of Moose creek at a distance of about 24 miles from Leanchoil Station on the Canadian Pacific Railway. For the first 11 miles the trail follows the old wagon-road built along the north side of Beaverfoot valley. This road was constructed many years ago to serve the *Shining Beauty* mine on Ice river. The country traversed by the trail up to Moose creek is timbered with a scrubby growth of jack-pine and balsam, which makes the trip somewhat monotonous, as little of the surrounding country can be seen.

The scenery at the head of Moose creek is typical of the Rocky Mountains. Some of the peaks, exhibiting great thicknesses of thinly bedded sedimentary rocks lying almost horizontally, seem to have been thrust upwards *en bloc*, leaving precipitous bluffs thousands of feet high, while the intervening talus-covered slopes pitch at a steep angle towards the valleys.

The area is composed of rocks belonging to the Upper and Lower Cambrian age, consisting principally of limestones. No igneous rocks were noticed.

Copper occurs as chalcopyrite in a vein which strikes in a direction of S. 55° E. across a steep hillside towards the summit of the ridge. Values found near the surface and the persistency of the vein encouraged prospecting, in hopes of finding ore in quantity. So far very little work has been done, but from what could be seen the vein is apparently a fissure cutting the formation and formed along a line of shearing.

At an elevation of 7,400 feet, or 2,200 feet above the valley-floor, several shallow open-cuts have been dug in the steep talus-covered slope of the mountain. The width of the vein-matter exposed is 6 feet, lying between limestone and a brecciated mixture of quartz and calcite on the hanging-wall side. The dip of the vein is almost vertical. The ore, consisting of chalcopyrite in a lime and quartz gangue, forms a band of about 1 foot in width. A sample of the best grade ore at the lower cut ran: Gold, trace; silver, 0.3 oz.; copper, 3.87 per cent.

A number of other prospects in this section of the Rocky mountains are described by John A. Allan in Memoir No. 55 of the Geological Survey. In this memoir will also be seen a description of the sodalite-deposits on Ice river at a short distance from the end of the old wagon-road. Its beautiful blue colour makes its an attractive stone for interior decorations.

The Yoho Mining Company, of Claresholm, Alberta, employed a few men during the summer on its property at Ottertail river. The claims, which include the *Sunday*, *Monday Fraction*, *Yvonne*, and *Empire*, are situated at about half a mile up the river from the railway and are easily accessible by wagon-road from Field. Little bunches and veinlets of ore have been found to occur irregularly in the soft stratified clays and shales which form high banks on either side of the river at this point. This formation would appear to be of recent origin, probably belonging to the glacial period.

The old workings, consisting of a 75-foot tunnel in the upper part of the bank and a 70-foot shaft sunk near the river-level, are both caved in. The dump of the tunnel indicates that it must have been driven in surface wash for almost its entire distance.

A few tons of ore is said to have been extracted from the bottom of the shaft and shipped to the smelter. A little ore, which had been left near the top of the shaft, consisted of galena and zinc-blende in a calcite gangue, a sample of which assayed: Gold, 0.01 oz.; silver, 5.2 oz.; lead, 25.7 per cent.; zinc, 17.8 per cent.

The latest work consists of a tunnel run in the direction of N. 15° W. for about 125 feet in a clay-like formation. At a distance of about 75 feet in there is an inclusion of white fluorspar, with which is associated a little galena and zinc-blende.

The formation is not the kind in which such minerals as above described are expected to be found, and the mere fact of finding ore at all is what impressed the writer more than anything else. The only conclusion that can be arrived at is that it is not in-place. Spending money on further prospecting would appear to be highly speculative.

Maud S.* This claim, owned by T. H. Bingham, of Parson, is situated on the northern side of Crystal creek, near the summit of the precipitous divide separating that creek from Vermont creek, about 26 miles by trail from Carbonate Landing on the Columbia river. The formation consists of schists, slates, and conglomerates dipping flatly into the mountain.

Briefly, there is a strong surface showing of galena (disseminated through quartz) in the face of a bluff at an altitude of about 8,300 feet. The bluff rises almost perpendicularly for several hundred feet above a small glacial basin, making the exploitation of the outcrop exceedingly difficult and even an examination a hazardous undertaking.

The ore-showing is apparently connected with a quartz-filled fissure-vein, which, at the bottom of the bluff, can be seen cutting nearly vertically across the sedimentaries towards the north-west. A grab sample of broken ore gave: Silver, 17 oz.; lead, 30 per cent.; zinc, 0.5 per cent.

WINDERMERE MINING DIVISION.

Paradise. A small crew of men has been employed during the season. Shipments were confined to only the highest grade of ore owing to the low metal prices. The tonnage produced will approximate 500 tons for the year. During the summer months the ore is hauled from the mine to the railway at Invermere by a White truck; the total distance from the mine being about 18 miles, while the difference in elevation between it and the shipping-point is about 5,000 feet.

Mineral King. W. L. Smith employed a small crew of men during the season at development and sacking ore from the surface diggings. A good cabin has been built, affording accommodation for eight or ten men. Since the property was examined last year a long open-cut driven in an easterly and westerly direction across the mineralized zone exposes nice showings of ore at intervals across a width of 86 feet. The old tunnel driven into the hillside at a depth of 34 feet below the bottom of this open-cut does not thoroughly explore the mineralized zone, and more drifting and crosscutting should be done.

A 34-foot drift driven last year in a westerly direction from the main tunnel developed ore for nearly its entire length, which shows in the roof as bunches and disseminations of galena associated with small percentages of zinc-blende and iron pyrites. The width of this ore could not be determined as the south side of the drift was in the vein.

The ore-body is not well defined, the whole rock-mass being shattered and sheared, in which ore occurs as irregular bunches and filling gash-veins. By following the direction of the shearing and crosscutting at intervals the best results from further development might be expected. A grab sample taken from ten sacks of sorted ore ran: Gold, 0.04 oz.; silver, 12.3 oz.; lead, 26.1 per cent.; zinc, 6.8 per cent. A sample of broken ore from the face of the West drift gave: Silver, 3.6 oz.; lead, 5.6 per cent.; zinc, 2.2 per cent.

The dump material, which consists of a mixture of ore and waste, probably contains about 200 tons of mill-feed. A sample taken at random over the surface of the dump, of the best grade of ore that might be expected for mill-feed, ran: Gold, 0.02 oz.; silver, 12.1 oz.; lead, 20.2 per cent.; zinc, 21.7 per cent. A number of other samples taken along this drift give an average value of: Silver, 5.5 oz.; lead, 6 per cent.

The recent work done under the present management has certainly improved the appearance of the property and further systematic development would seem to be fully justified.

For further previous references see Minister of Mines' Report for years 1898, 1915, and 1920.

Bear Group. This property, consisting of five claims, is situated on the same hillside and at a distance of about half a mile from the last-mentioned property. A few shallow surface diggings expose the presence of a small quartz vein mineralized with galena, zinc-blende, and a little grey-copper. The vein follows the summit of a

limestone ridge. Further work in the nature of crosscutting may reveal the presence of more ore at a depth. Prospecting was being done under the direction of W. L. Smith.

A sample of carefully sorted ore ran: Gold, 0.01 oz.; silver, 27.5 oz.; lead, 21.7 per cent.; zinc, 1.1 per cent.

Bunyan. Work was continued at this property during the season under the supervision of E. J. Fader. At the time of examination in June a lower crosscut tunnel had been driven for a length of 285 feet in a schist formation. No ore had been encountered, so it was decided to raise in the hope of encountering the ore exposed in the level 128 feet above. This upper level is now completely caved in and the rock in its vicinity is shattered and broken as a result of a big blast which was exploded last year. Barytes outcrops along the upper part of the bluff and it is possible that further prospecting might open up a considerable tonnage, which could be mined cheaply.

Among other properties on which prospecting-work was done are the *Bald Eagle*, on Slade creek, of which John Burman is the principal owner; the *Isaac*, on No. 3 creek, owned by H. E. Forster and recently bonded to W. D. McMillan; and the *Silver Spray*, on Copper creek, owned by Murdock McLeod.

FORT STEELE MINING DIVISION.

Sullivan. The production of this mine has been maintained this year to meet the requirements of the company's smelter at Trail and shows an increase over that of last year. Development and exploratory work with the diamond-drill has been systematically proceeded with.

The long adit-tunnel driven from Mark creek is now in over 9,000 feet. From this level the vein is developed at a depth of 1,500 feet on the dip, which averages about 20° to the east. The direction of the tunnel is N. 3° E. and parallel to the strike of the vein. It has been driven in the foot-wall and lies about 40 feet below the vein. Where ore has been encountered crosscuts have been run to the vein at intervals of 120 feet and a raise driven half-way between each pair of crosscuts.

In order to facilitate the drawing of ore as the stoping proceeds upwards, a parallel tunnel has been driven for a distance of 700 feet and at 200 feet west of the main tunnel. From this tunnel raises will be driven to tap the ore-body, the first one of which was just breaking through at the time of the writer's visit in October. The workings of this level are connected by a raise 761 feet long with the upper workings.

Owing to the flatness of the dip, conditions have not been found favourable for mining on the shrinkage system, as the ore will not run on the foot-wall; hence some method had to be evolved whereby a large tonnage could be economically handled. It would seem that the problem had now been solved to a very large extent by the employment of drag-scrapers in the stopes, two of which are now installed in the large stope of the southerly ore-body.

A 25-horse-power double-drum hoist is set up at the bottom of the stope and the haulage-cable is passed through a snatch-block secured to a ring or cable strung along the top of the stope. A heavy steel-pronged scraper is dragged up and down the foot-wall, bringing on its downward trip anywhere from 2 to 10 tons.

The southerly ore-body as developed from the adit level is situated at a distance of about 7,000 feet from the portal. The width of the vein and its dip vary; this is due to heavy rolls in the walls; at the northerly end of the stope it shows a width of about 30 feet, representing a width of 80 feet where it is cut obliquely by the sill-floor of the stope. The chambers of the stope can best be described as huge underground quarries, in which a pile of 21,000 tons of broken ore seems to take but little room, while to reach the upper faces a little underground mountain-climbing is necessary.

The southerly margin of the north ore-body has been encountered near the end of the adit-tunnel, and at this point the vein swings to the west, so that the direction of the tunnel had to be changed accordingly to avoid running in ore, which was not desirable. Between the north and south ore-bodies there is an iron-sulphide zone corresponding to that on the upper level. On this lower level it is composed of pyrrhotite.

At the upper workings mining is being principally confined to stoping between the 1,000-foot and 1,100-foot levels. The ore is transported to the railway by aerial tram. These workings at present constitute a separate mine, with camp buildings complete.

The outcroppings of the vein on the hillside above the 1,000-foot level, though strong, are not as big or continuous as might be expected for ore-bodies of such vast dimensions.

The total output of the mine for the first ten months of the year was given as follows: Zinc ore, 236,612 tons; lead ore, 54 tons. Between 200 and 300 men are steadily employed.

Among the recent improvements a new camp-site has been laid out on a flat bench at a short distance from the portal of the low tunnel and a few neat buildings have already sprung into existence. The mine equipment is up to date, excellent accommodation has been provided for the men, and an air of efficiency prevails throughout.

Frequent references have been made to this property in previous Annual Reports, while the geology of the area and ore-deposits are described by S. J. Schofield in Memoir No. 76 of the Geological Survey.

PERRY CREEK.

A trip was made up this creek during the latter part of July; unfortunately, owing to unforeseen circumstances, time only allowed the examination of several properties. The area, however, has not been neglected by mining engineers and geologists, while reports on various properties may be referred to in the Minister of Mines' Reports and in Memoir No. 76 of the Geological Survey.

The creek is approximately 20 miles long and empties into St. Mary river at a point about 8 miles north-west of Cranbrook, from where a wagon-road leads to within 7 miles of its head.

Around the head of the creek the summits are rounded and present a fairly even skyline, while the hill-slopes are well covered with detritus supporting a heavy growth of timber. Erosion by glaciation is pronounced and has no doubt been the chief factor in accounting for the concentration of gravels lower down the creek.

Near the headwaters the valley widens, forming a basin-like depression, which suggests that at one time it was either filled by a glacier or small lake. In the opinion of a pioneer placer-miner who had worked on the creek in the early sixties, at one time a lake did occupy this basin and the creek followed a different channel at the falls; owing to an uplift the waters of the lake were flooded down the valley, carrying with them immense quantities of material which choked the original channel with boulders, piled the gravel in high banks on either side, and forced a new channel, through which the creek now flows. Although delving into the depths of the uncertain past, this theory is interesting and sounds feasible, for there certainly is an old channel entering the creek just below the falls, at which point the Wild Horse Gold Mining Company is now operating. This company, under the management of A. J. Palmquist, has succeeded in conveying water from the old flume to the top of the bank, from where it is piped down for a distance of about 300 feet to the monitor stationed 100 feet above the level of the creek.

The gravel filling the old channel represents a bank of about 400 feet high; for the first 100 feet or so it is darker in colour and shows a stratification different from the upper portion, which latter contains a greater proportion of silt. It would seem probable that the old channel occupied a box canyon similar to the one through which the creek now flows.

At the time of the writer's visit the stream of the monitor was playing on a mass of boulders at the bottom of the bank. The sluice-box is laid on the gravel at the edge of the creek and is connected with a flume from a pool just below the falls, which provides additional water for sluicing. On account of the great height of the bank and the limited amount of room between the working-face and the creek, it is a proposition which will have to be worked very carefully; while getting rid of the tailings presents somewhat of a problem, as the grade of the creek does not exceed 3 per cent.

Previous attempts to win the gold from these gravels are described by the Provincial Mineralogist in the Annual Report of the Minister of Mines for 1903, a copy of which description may be seen in Memoir No. 76 of the Geological Survey.

As regards lode-mining on this creek, activity in prospecting was the natural sequence to placer-mining, and the surrounding country was prospected in an endeavour to discover the source of the gold found in the alluvial deposits.

The year 1896 probably marked the greatest activity in this direction, at which time the country was more easily accessible than it is to-day, as the majority of the prospects have since been abandoned, the old cabins have become dilapidated, and many of the trails overgrown and obliterated.

The characteristic features of the area and remarks on milling operations are embodied in the report of the Provincial Mineralogist, who visited a number of properties in 1898, from which the following are excerpts:—

"A large number of claims were from time to time recorded, many of which were justified by the discoveries made, but as many more on no apparent values. The work done has proved, however, that there are without doubt a number of very strong parallel quartz ledges, some of a great width and traceable for miles, running S. 20° W., or about parallel with the general direction of the creek, and dipping nearly vertical.

"Recognizing the futility of trusting to small samples and that a satisfactory test of the various properties could only be determined by a practical test, J. E. Hardman, mining engineer of Montreal, had a small stamp-mill erected in 1897 at the mouth of Sawmill creek for the purpose of making mill tests of the ore from the various properties he had under bond.

"Test runs were made on ore from several of the claims on the creek, in lots of 5 to 10 tons each. The results obtained were not commercially satisfactory, for, notwithstanding the fact that some gold was saved, in no instance were the values sufficiently high to warrant serious work on the claims. The tests, however, do not seem to have satisfied the claim-owners, as the results obtained did not tally with their private assays. I heard several complaints about the matter, regret being expressed that the running of the mill had been left to inexperienced men and values allowed to escape in the tailings. Of this I know nothing further than was told me by men who might be considered 'interested parties.'"

After describing tests made by panning the tailings, he concludes his report as follows: "As a result of my investigation, I am satisfied that the mill did not save such free gold as may have been in the ores, and that the tests made were not conclusive as to the values of these properties. I am further satisfied that only a portion of the gold is 'free' and that some method of concentration would have to be adopted to save the gold occurring in the iron sulphides."

Since this report was written more work has been done at the *Homestake*, *Running Wolf*, and possibly some other claims in the vicinity, but, as far as the writer knows, the two mentioned are the most highly developed. The former was reported on by J. D. Galloway in the Annual Report of the Minister of Mines for the year 1915, and the latter property is mentioned in Memoir No. 76 of the Geological Survey.

Yellow Metal Group.

This group comprises 11 claims, which cover the rounded summit of the divide between Hellroaring and Perry creeks and also a portion of the Perry Creek slope. W. van Arsdalen, who is interested with Ed. McMahen, has spent a number of seasons in prospecting the area in the endeavour to prove the existence of a large body of low-grade gold ore, having been encouraged by the results obtained by panning material from a number of places on the property, more particularly along the summit of the ridge.

The area is underlain by thinly bedded quartzites of the Creston formation, having a strike of N. 25° E. and a dip of 67° to the north-west. On the summit, at an elevation of about 7,000 feet, these quartzites have been crushed and shattered by glacial action, with the result that the surface is covered to a depth of about 6 feet with detritus. The quartzites, shot with small stringers of quartz, upon crushing, yield colours to the pan, but the best results can be obtained from the dirt along the bed-rock below the detritus; the glacial erosion no doubt having performed the same function of concentration, to a small extent, as that of a creek. A sample of some of this dirt taken on a previous occasion only yielded a trace of gold; but assays of small samples of such material cannot be considered as representative, while panning may also be misleading. This band of quartzites shows a width of about 300 feet and has been prospected by open-cuts and long trenches across its strike and a 20-foot shaft, which is now caved.

At a short distance down the Hellroaring Creek slope a quartz vein has been prospected by a 20-foot open-cut along its strike. It has a width of 20 inches and is well defined by 3 inches of gouge on the hanging-wall and crushed material on the foot-wall. In dip and strike it conforms to the formation. A sample taken across 20 inches of quartz ran: Gold, 0.19 oz.; silver, 0.2 oz.. A sample across a 3-inch streak of gouge ran: Gold. 0.32 oz.; silver, 0.3 oz.

On the Perry Creek slope, at no great distance from the main trail, prospecting consisting of open-cut work has been done on two strong quartz veins having a north-westerly strike; the quartz is well mineralized with iron sulphides, but does not carry any appreciable gold values.

Still farther down prospecting has been done on a well-defined quartz-filled fissure, which has the same strike as the quartzites, but cuts them on the dip. The width of this vein is about 4 feet; it strikes N. 23° E. and dips at 80° to the south-east. The filling consists of crushed quartz stained with iron oxide, and it is a promising-looking vein, but as yet has only yielded small gold values. The work consists principally of a shallow shaft, several open-cuts, and two tunnels, the lowest of which has been driven for 25 feet and gains a depth of 125 feet below the shaft.

Further reference to this property may be seen in the Annual Report of the Minister of Mines for 1915.

Park Group. This group, comprising the *Hercules*, *Park*, and *Bee Line* claims, is owned by W. A. Chisholm and is situated at a distance of 1 mile from the railway at Marysville. The country is undulating and a motor-car can be taken to within a short distance of the workings. The area is underlain by quartzites which have been intruded by diorite dykes and sills. The vein is a quartz-filled fissure in diorite, having a width of about 5 feet and striking N. 80° W. The ore, consisting of galena associated with a quartz and calcite gangue, is free from zinc and carries low silver values. It occurs irregularly distributed over a length of about 200 feet along the strike of the vein.

The property has been systematically prospected by trenches and open-cuts. The strongest surface exposure examined showed a width of 30 inches, across which a sample was taken; this gave the following results: Gold, 0.02 oz.; silver, 3.2 oz.; lead, 18.2 per cent.

Old workings consisting of a shaft 60 feet deep, from the bottom of which 70 feet of drifting had been done, could not be examined on account of water. A shipment of 17 tons made from these workings about six years ago gave the following returns per ton: Silver, 6.1 oz.; lead, 48 per cent.

Further prospecting on the Sand Creek iron-deposits met with encouraging results.

The Federal Mining and Smelting Company has taken a bond on the *Stemwinder*, which is situated on Mark creek between the *Sullivan* and *North Star* mines. Diamond-drilling has been commenced.

Evans Bros., of Marysville, continued their prospecting and development work on the *Achilles* group. Nice samples of copper ore have been brought in from this property.

One of the finest beds of fossils yet found in this district was discovered near the road from Cranbrook to Fort Steele by Colonel C. H. Pollen. The fossils are mostly of the trilobite family and are classified as belonging to the Upper Lower Cambrian.

Dr. S. J. Schofield, of the Canadian Geological Survey, was camped during the early part of the season near Fort Steele, whence he moved northwards into the Windermere Division.

Victor. Since reporting on this property in 1917 there has been a large amount of money spent on development and mill-construction. The property is owned by the Victor-Silver Leaf Mining Company, of which R. Abernethy, of Spokane, is the president and his son, Elmer R. Abernethy, is secretary. The capital for these recent expenditures has been principally provided by capitalists of Flint, Michigan, under the terms of a lease and bond. R. Abernethy has been retained as manager under the terms of the agreement.

Briefly, the vein cuts a narrow ridge between Maus and Lost creeks and is exposed in a precipitous rock bluff on the Maus Creek side. In this bluff three drifts have been run. The portal of the No. 1, or uppermost, is located at about 1,000 feet below the summit of the ridge and has been driven along the vein for 387 feet. The No. 2 drift is 125 feet vertically below the No. 1 and has been driven for 427 feet. The No. 3 drift was started in the slide-rock at the base of the bluff at 100 feet vertically below No. 2. This tunnel is now in a considerable distance and will be continued this winter. The workings are not connected, no sinking or raising on the vein having been attempted. No ore of commercial importance had been encountered in the No. 3 tunnel at the time of the writer's visit in July.

The ore is a complex mixture of galena, zinc-blende, and iron pyrites in a quartz gangue, and is irregularly distributed as small lenses, streaks, and disseminations. At few places does it exhibit a workable width. The best grade of ore is exposed at the portal of the No. 1 tunnel, where there is a small bunch of coarse cube galena in an oxidized gangue material. A sample of this ran: Gold, 0.03 oz.; silver, 30.3 oz.; lead, 68.1 per cent.; zinc, 6.4 per cent. Other samples taken in the No. 1 and No. 2 tunnels would indicate the values to average about as follows: Gold, 0.05 oz.; silver, 10.5 oz.; lead, 14 per cent.; zinc, 9 per cent.

Sullivan Mine, Fort Steele M.D.—Portal of Tunnel.

Perry Creek, Wild Horse Gold Mining Co.

UNIVERSITY OF ILLINOIS LIBRARY

The mill-site is on the side-hill at a distance of over 1,000 feet from the portal of the No. 3 tunnel, with which it is connected by a covered track. The mill equipment, which was not complete, consisted of a Blake crusher, one set of rolls, and two Overstrom tables.

The water-power available from a small glacier-fed creek was only sufficient to drive an 8 by 9 Sullivan compressor, so additional power is provided by a 25-horse-power, type Y, Fairbanks-Morse semi-Diesel engine, which was said to be giving excellent satisfaction on a consumption of about 12 gallons of coal-oil per 8 hours.

A mixed car-load of ore and concentrates was shipped in the fall.

Placer-mining.

Besides the activities already described on Perry creek, the Gamble Mining Company had a monitor operating on Wildhorse creek. The extreme dryness of the season necessitated closing down work earlier than was anticipated. It is understood that the results came up to expectations and work will be resumed early next season.

Gypsum.

A deposit of gypsum occurs along the north bank of Bull river at a distance of about 3 miles from the main road to Fort Steele and within a short distance from the falls. The branch road leading up Bull river traverses a flat bench in the vicinity of the deposit. The river cuts this bench to a depth of about 300 feet, leaving a steep bank on the northerly side. Unfortunately, the surface of the bank is covered to a considerable depth with soil and few rock-exposures are visible.

However, shallow diggings at various places have uncovered the mineral, and from all indications there is a large deposit conforming to the dip and strike of the formation.

The writer is indebted to Dr. S. J. Schofield, of the Geological Survey, for following notes on the general geology of the area: "The gypsum occurs interstratified with the Devono-Carboniferous limestone, outcrops of which occur lower down Bull river and crossing Kootenay river to the hills west of Wardner. This mass of Devono-Carboniferous limestone is in the form of a syncline, which strikes approximately parallel to the strike of the Kootenay valley. The gypsum at Bull river occurs in the eastern limb of the syncline."

An analysis of a representative sample gave the following results: Gypsum, 80.5; carbonate of lime, 14.4; insoluble, 3.5; magnesium oxide, 0.6; organic matter, 0.8.

The deposit could be further prospected and developed at small cost, while its nearness to both the Kootenay Central Railway and power-site at the falls make it particularly attractive for commercial enterprise.

Graphite.

A small deposit of graphite was discovered on the westerly bank of Matthew creek at a short distance from the wagon-road. The nature of its occurrence was difficult to determine as the formation was so badly faulted and broken, but so far as could be seen it apparently has been deposited along the contact of a micaceous schist and a porphyry dyke. It is of a massive variety and of good grade, but as yet no deposit of commercial importance has been developed. The shattered and faulted ground suggests that the rock along the creek where the work has been done is not in-place but has slid down in large masses from a point higher up the hillside.

Coal Production.

Robert Strachan, Senior Inspector of Mines, reports as follows:—

"The production of coal for the year is about 10 per cent. less than for 1920, and amounts to 759,755 long tons.

"Coal Creek Colliery shows a decrease of about 4 per cent., Corbin 55 per cent., while Michel shows a slight increase.

Colliery.	1920.	1921.	Increase.	Decrease.
Coal Creek	431,783	413,523	....	18,260
Michel	264,592	278,301	13,709	....
Corbin	151,014	67,931	....	83,083
Totals	847,389	759,755	....	....

"Coke production will show about 59,434 tons, a decrease of 8,358 tons from 1920.

"None of the coke-ovens at Fernie have been in use during the year, while only about 50 per cent. of the Michel ovens were required to fill the demand for coke.

"The cause of the decrease in the production is due mostly to lack of demand for coal, the mines having only averaged about 75 per cent. of their working-time.

"While the mines have only worked about 75 per cent. of the working-days, the output of coal will show about 12 per cent. of a decrease, indicating that while the mines were working a larger production was made than when working full time.

"Labour has been very plentiful throughout the year.

"No new mines have been opened at Coal Creek, but all the mines have been operated, and during the summer a large ventilating-fan, with a capacity of 300,000 cubic feet of air a minute, is being installed at the No. 1 East mine, to replace the present Wilson fan, for which the mine has become too large.

"A circular shaft has been sunk, concreted from the rock up, and the fan-house and engine-room are made of the same material.

"It has not been decided yet whether the fan will be driven by steam or electric power, as the completion of the Alberta and British Columbia Power Company's plant at Bull river will probably mean the changing of most of the collieries from steam to electricity as a motive power.

"At Michel the present mines have been developed to such an extent that in spite of the slack time the production is greater than the previous year, and the greatest handicap at present is lack of housing accommodation for the workmen.

"At both Michel and Coal Creek the Crow's Nest Pass Coal Company has been drilling the measures, and while no detail has yet been issued, this work has proved the existence of remarkably fine coal-seams, both over and under the present measures.

"At present a cross-section of over 2,000 feet has been proved at Coal Creek, and no doubt will prove very valuable in the future development of the mines.

"At Corbin the decrease in production runs very high—namely, 56 per cent.—and is due to the closing-down of the Big Showing or open-cut mine.

"The future developments in Corbin will probably be farther up the creek, where the measures seem more regular and the coal carries a less quantity of surface dirt.

"Following this line, the No. 6 mine has been opened 2 miles above the town of Corbin, where the coal seems more regular, although the seam at the 5,390-foot level averages 400 feet thick.

"The intention is to develop this seam along the panel system and extract the pillars as soon as the panel is completed."

WEST KOOTENAY DISTRICT.

AINSWORTH MINING DIVISION.

In common with other silver-lead-producing districts, the Ainsworth Division has suffered from an unusually quiet season and its production of silver and lead will fall short of last year. This is due to the inactivities of the larger producers brought about by the low metal prices.

AINSWORTH CAMP.

Florence.—Large bodies of ore have been developed at this property, but owing to the comparatively low silver content economic production could not be maintained under the prevailing conditions of the lead market. During the early part of the year a small tonnage of the high-grade ore was shipped by leasers to Trail.

Spokane-Trinket.—A small shipment was made from this property, which has been a steady producer during the last three or four years.

Highland.—This mine, owned by the Consolidated Mining & Smelting Company, was operated under lease for part of the season by L. Oughtred, who was formerly in charge of the property for the owners.

No. 1.—This mine, also owned by the Consolidated Mining & Smelting Company, was operated under lease by T. Hawes and associates.

Skyline.—It is reported that work has been abandoned by J. Sime and associates, who were operating it under lease and bond.

Silver Hoard.—S. McPherson and J. Sherman are operating the property under lease.

Kraa.—Small shipments of exceptionally high-grade silver ore were made from the upper workings. W. E. Zwicky, who controls the property, is doing some exploratory work below the 100-foot level.

The Lakeshore Mining Company, in which Spokane capital is interested, was formed during the year and a number of claims were acquired, running from the lake-shore up the hill and covering a strip of ground between the *Florence* and *Highland* properties. Work was started by driving a crosscut tunnel, the ultimate length of which will be about 700 feet. The object of this tunnel is to explore, at a depth of 200 feet, promising-looking surface showings and to tap an old shaft now partly filled with water.

Riondel.

Bluebell.—After shipping about 3,450 tons during the early part of the year, operations were suspended pending more favourable market conditions.

Kirby Group. Situated near Riondel and within a short distance of Kootenay lake. During the year work was first confined to prospecting the surface showings near the old workings, under the supervision of A. J. Curle and R. Guthrie. The general run of the ore is a mixture of galena and zinc-blende associated with iron pyrites in a gangue of quartz and spathic iron. Concentration will be necessary before shipping to the smelter; hence the future of the property depends upon the development of sufficient tonnage to warrant mill-construction.

The vein has a strike of north and south and dips at an angle of 35° to the west, or towards the lake, conforming to the stratification of the enclosing rocks. It has been approached by a 55-foot crosscut tunnel and drifted on for about 100 feet along the footwall side. This drift does not gain any appreciable depth and terminates in a deep open-cut, from which a 30-foot shaft has been sunk. The shaft is said to have encountered 4 to 5 feet of milling-ore, but this could not be examined on account of water. The great depth of wash overlying the bed-rock renders further exploratory work along the strike of the vein both expensive and unsatisfactory.

Evidences of vein-matter in the bed of a small creek immediately above the shaft led to further prospecting slightly higher up the hill, and a nice showing of ore was uncovered by trenching. The work done on this had not been sufficient to prove the true width of the vein or its relation to that exposed by the workings already referred to, but it is probably either a parallel vein or the same as that exposed in the tunnel.

However, the surface showings were considered sufficiently encouraging to justify exploration at a greater depth, and with this object in view a long crosscut tunnel was started from a point near the lake-shore. It is estimated that this tunnel will gain a depth of 300 feet on the dip of the vein. The accumulation of wash which forms the lower benches of the hill is greater than was expected, for the tunnel is now in 285 feet and there is still no sign of bed-rock.

Further reference to this property may be seen in the Annual Report of the Minister of Mines for 1920. In this report the following typographical error was noticed: "dykes of rock" should read "dyke-rocks" on page 120.

Woodbury Creek.

This creek, heading from the Kokanee glacier, flows in an easterly direction and enters Kootenay lake at a point 2½ miles north of Ainsworth. It drains a large granite area lying to the west of that underlain by the sedimentary rocks bordering the lake. It is in this granite area that the following described properties are located. As will be noticed, the ores are of high grade, carrying little zinc and a high ratio of silver to the unit of lead.

Jessie Bluebird.* This property, owned by E. Johnson, of Kaslo, is situated at an elevation of about 6,500 feet (lower tunnel) on the northern side of the North fork of Woodbury creek, about 10½ miles from Kootenay lake. The *Jessie Bluebird* trail, about 1½ miles in length, branches off the main Woodbury Creek trail at a point about

9 miles up from the lake. The workings, which aggregate some 1,500 feet of development, follow a zone of shattered rock or sheared fissure in granite which in places exceeds 20 feet in width.

The ore occurs mostly in siliceous stringers and lenses, ranging from 1 to 2 feet in width, which run in an irregular manner through the fissured and altered granite, but is also found disseminated through or in small bunches in the granite itself. It consists principally of galena, grey-copper, and silver sulphides, and is considerably leached and decomposed from oxidation.

The lead strikes in a south-westerly direction, dipping at about 58° to the north-west, or into the mountain. Access to the lead is by means of two crosscut tunnels about 100 feet vertically apart. The upper crosscut or No. 1 level is 80 feet to the lead, which has been drifted on for 200 feet to the south-west. A sample across 12 inches in the floor of this drift, about 50 feet in from the crosscut, gave: Gold, 0.04 oz.; silver, 209.6 oz.; lead, 8.9 per cent.; zinc, 0.5 per cent.

Two winzes sunk on the lead from this drift are 70 and 110 feet in from the crosscut and 45 and 25 feet down respectively. A short drift has been run to the north-west from the bottom of the 45-foot winze, where a lens of ore was encountered. The lower crosscut or No. 2 level is 200 feet to the lead, which has been drifted on for about 500 feet to the south-west. At a point 395 feet along this drift from the crosscut a raise 120 feet long on the dip of the lead connects with No. 1 level, and 50 feet up this raise an intermediate tunnel has been driven 50 feet north-easterly. An average sample across a lens of ore 12 inches wide and 25 feet long in the floor of this intermediate level gave: Gold, 0.05 oz.; silver, 366.5 oz.; lead, 7.9 per cent.; zinc, 4.4 per cent.

At the time of the writer's visit in September stoping was in progress from three 40-foot raises above the south-western end of the drift on No. 2 level. The stope was then 60 feet long and was being carried about 4 feet wide.

The ore is roughly sorted in the stope and re-sorted in daylight, as only the highest grade is shipped at present owing to the heavy packing charges to Kootenay lake, which amount to $30 a ton. A grab sample of roughly sorted ore in the stope gave: Gold, 0.02 oz.; silver, 217.6 oz.; lead, 24.2 per cent.; zinc, 0.5 per cent. A grab sample from about 6 tons of ore sorted for shipment gave: Gold, 0.05 oz.; silver, 382.4 oz.; lead, 13.5 per cent.; zinc, 1 per cent.

The sorting requires an intimate knowledge of the character of the ore, as some of the best values are obtained from material which looks unattractive to the uninitiated.

The workings are mostly on the foot-wall side of the lead and scarcely any crosscutting has been done. Twenty-one tons of ore was shipped to Trail in October.

Grant.* This property, consisting of the *Grant* and *General* Crown-granted mineral claims, is situated on the north slope of the mountain on the southern side of the North Fork of Woodbury creek, about 5 miles in a direct line from Kootenay lake, the nearest shipping-point being the Princess Creek wharf, distant about 8 miles by trail and road (6 miles by trail and 2 miles by road). The property is owned by C. F. Olson, of Ainsworth, and is being operated under lease by Bridge & Kennedy.

The altitude of the lower tunnel is about 4,500 feet. Grey-copper carrying high silver values, with small amounts of galena and zinc-blende, occur in small shoots in quartz-filled fissure-veins which cut a siliceous limestone formation near its contact with the granite. The principal work has been done on a vein cutting vertically across the formation in a north-easterly and south-westerly direction. Access to the vein is by means of two crosscut tunnels about 80 feet vertically apart. The upper crosscut is 28 feet to the vein, which has been drifted on for about 100 feet to the south-west. An ore-shoot encountered in this drift was stoped to the surface. The lower crosscut is 100 feet to the vein, which has been drifted in for about 400 feet to the south-west. Two raises, about 130 and 250 feet distant respectively from the crosscut, are up about 60 feet.

At the time of the writer's visit in July Bridge & Kennedy were stoping, sorting, and sacking ore from these raises. The width of the vein in these stopes varies from 1 to 2 feet, with a rich pay-streak of quartz and grey-copper from 4 to 8 inches in width. A sample across an 8-inch pay-streak in the stope farthest in from the crosscut gave: Gold, 0.02 oz.; silver, 629.4 oz.; lead, 13.3 per cent.; zinc, 4.8 per cent. A sample across a 4-inch pay-streak in an open-cut above the upper tunnel gave: Gold, 0.08 oz.; silver, 851.1 oz.; lead, 35.8 per cent.; zinc, 18.6 per cent.

About 300 feet northerly from the portal of the lower crosscut another vein is exposed in a shallow cut by the side of the trail. This vein, which is about 2 feet wide, apparently has a north-westerly and south-easterly strike, but insufficient work has been done to ascertain the dip. The outcrop of this vein is considerably oxidized from the leaching-out of the sulphides. Some selected specimens of this oxidized outcrop material gave: Gold, 0.01 oz.; silver, 52.1 oz. With the exception of this shallow cut no work has been done on this vein.

The ore is carefully sorted and Bridge & Kennedy hoped to maintain an average of 600 oz. to the ton for the ore which they were sacking for shipment. Twenty-one tons was shipped to Trail in November.

Violet Group.* This property, consisting of the *Violet* and *Lookout* claims, owned by John Henry and J. M. Currie, of Ainsworth, is situated on the northern side of Woodbury creek at an altitude of about 8,400 feet (upper tunnel) near the summit of the divide separating that creek from the South fork of Kaslo creek. The claims are reached by a trail about 3½ miles in length which branches off the main Woodbury Creek trail at a point about 9 miles from Kootenay lake. Development-work done amounts to about 240 feet of tunnelling and a 60-foot raise.

The ore, consisting principally of grey-copper and silver sulphides, with small amounts of galena and pyrite, is found in siliceous stringers and bunches on the foot-wall side of a sheared zone in granite which strikes north-easterly along the summit of the divide. The hanging-wall is not clearly defined, but the lead appears to have a width of from 6 to 15 feet and almost vertical dip. Within the lead the granite is much altered in appearance, with highly siliceous phases.

Just below the summit a 50-foot tunnel has been driven on the lead. Sixty feet vertically below this level a tunnel has been driven 110 feet, partly as a crosscut and partly along the hanging-wall side of the lead. Fifty-four feet in from the portal of this tunnel a 10-foot crosscut has been made to the foot-wall of the lead, which was then drifted on for 15 feet to the north-east and 26 feet to the south-west. Near the extremity of the lower tunnel a raise connects with the upper tunnel.

The ore is carefully sorted for shipment, as packing charges from the workings to Kootenay lake are about $35 a ton. Grab samples of sorted ore gave:—Upper tunnel: Gold, 0.02 oz.; silver, 935.5 oz.; lead, 31.2 per cent.; zinc, 3.9 per cent. Lower tunnel: Gold, 2.02 oz.; silver, 90.1 oz.; lead, 33.5 per cent.; zinc, 1 per cent.

Wood for fuel has to be brought from over a mile away to the camp, but fortunately the ground in the workings requires scarcely any support. At the time of the writer's visit in September 4 tons of high-grade ore had been extracted and was awaiting shipment.

South Fork of Kaslo Creek.

Activities up the South fork have been confined to prospecting and a little development-work at the various properties, but no attempt has been made to ship ore, except from the *Silver Bell*, from which 45 tons is recorded.

M. S. Davys has had a few men employed at the *Silver Bear*, while adjoining claims have been prospected by L. McLeod.

Other minor activities include prospecting done at the *Liberty* under the supervision of W. Y. Williams, and a little development at the *Revenue* and *Gold Cure* groups.

Retallack.

Possibly one of the most important transactions which have taken place with regard to properties near Kaslo is the lease of the *Utica* to O. C. Thompson and associates, who for the past number of years have been successfully operating the *North Star* mine near Kimberley.

It is reported that under this lease the long crosscut tunnel which was started a few years ago will be continued to intersect at depth the two main veins. From the upper levels a considerable tonnage of high-grade ore has been extracted in the past.

At the *Mowhawk*, which is situated at a short distance from the *Utica*, J. Chisholm is driving on the vein in an endeavour to pick up the downward continuation of the ore-shoot below its outcrop.

Whitewater.—There has been an average of ten men employed at the mine. No new developments of any special significance have been made. About 200 tons of ore was shipped to the Bunker Hill smelter at Kellogg, Idaho.

SLOCAN MINING DIVISION.

In view of the depressed market conditions prevailing throughout the greater part of the year, there has been as much activity in the Slocan as could be expected.

Silversmith. A large crew was steadily employed during the summer months at construction-work. The old *Ivanhoe* mill, recently operated by the Rosebery-Surprise Mining Company, was acquired by the Silversmith Mines, Limited, remodelled and added to. A new aerial tram was constructed to connect the mill with the mine; this is equipped with the cable and buckets of the old *Centre Star* tram.

During the early part of the year the mine produced 2,021 tons of lead concentrates and 134 tons of crude ore. During this same period there was also produced about 2,000 tons of zinc concentrates which has not been shipped. No mining has been done since April 1st, pending the completion of the mill and tramway. It is expected that operations will be resumed in the near future.

Payne.—A certain amount of exploratory work, in the nature of crosscutting from the low-level workings, was done under the supervision of W. J. Elmendorff, a mining engineer of Seattle. It is understood that lack of capital caused the suspension of operations.

Rambler-Cariboo.—This property ranks as one of the steadiest producers of the Slocan. The company suspended operations this year and work was carried on by W. A. Cameron, the former manager, under the terms of a lease.

Queen Bess.—A few men have been steadily employed during the season by Clarence Cunningham.

McAllister. This property is owned by the Slocan Silver Mines, Ltd. R. A. Grimes, who is in charge, reports that the development-work done during the season includes 800 feet of drifting and raising in addition to surface exploration. The vein has been drifted on for over 1,000 feet on the No. 3 level, which is connected by three raises to the No. 2 level. By careful and systematic sampling he estimates that there is now a large tonnage of ore available, which will carry an average value of 33 oz. in silver to the ton.

Ruth. This property, including the *Ruth, Hope, Wyoming,* and *Ruth Fraction,* was one of the most important producers during the earlier history of the Slocan. It is owned by London interests, of which James Anderson, of Kaslo, is the local representative. The underground workings are extensive, while surface equipment includes an aerial tram and concentrator, the latter being situated alongside the railway. The vein is

of the typical fissure type of the Slocan. The ore-shoots as developed were strong and persistent along the strike.

During the period of inactivity in recent years the tunnels from the surface have in many places become caved, leaving only a comparatively small section of the old underground workings accessible. This year the property was leased to J. H. Black and associates, of Sandon, who started work in May and reopened the No. 3 level. Several nice shoots of galena were uncovered along the bottom of the drift and underhand stoping was commenced. The ore thus developed consisted of galena in crushed and decomposed ledge-matter heavily stained with oxide of iron. The true walls of the fissure are not definitely disclosed by the drift and more crosscutting than has been done would appear to be fully justifiable.

In the No. 2 level ore is exposed across a width of about 6 feet in the bottom of a crosscut and at a distance of 30 feet to the south of the main vein. A crosscut has been started from the No. 3 level to explore the ground under this showing. A grab sample from a pile of 35 tons extracted from these workings ran: Silver, 102.7 oz. a ton; lead, 65.2 per cent.; zinc, 3.2 per cent.

The following description of the discovery of this property, taken from W. A. Carlyle's report published in the Annual Report of the Minister of Mines for 1896, should be of interest to prospectors: "After many hardships and disappointments, but persistent prospecting, the *Ruth* vein was accidentally disclosed by a small piece or two of iron-stained rock sticking in the roots of a windfallen tree that had stood nearly on the top of the ledge, and even then considerable work had to be done before the ore-shoot was struck from which has since come the mine's production."

At the *Gem*, which is situated near Sandon, a small tonnage of high-grade silver-lead ore was extracted from the bed of Carpenter creek by Mickey Byrne, who bought the property from F. Edwards, the original owner.

Boulders and small nodules of all shapes and sizes of water-worn galena are found in the creek-gravels at the foot of an old slide. They are all well rounded and, to look at, resemble ordinary creek boulders and pebbles. No doubt they originally came from some ledge on the hillside, which, needless to say, has been carefully prospected, but the identity of the ledge is still uncertain.

Carnation Group. Situated at an elevation of 6,000 feet at a distance of about 5 miles by trail in a south-westerly direction from Sandon. The group comprises the following claims: *Tenderfoot*, *Read*, *Carnation*, *Violet*, *Evening*, *Jennie*, *Jennie Lind*, and *Mollie O.* The claims are located on the northerly slope of Carnation mountain, from the summit of which one can look down on the mines of Silverton camp and Slocan lake, while an excellent view can also be obtained of the outstanding topographical features of the Slocan district. The area is well within the zone of mineralization and is underlain by rocks of the Slocan series, which have been intruded by granite-porphyry dykes from the near-by Nelson batholith.

Since the property was visited and reported on in 1917 a large amount of underground development and exploratory work has been accomplished under the management of G. W. Clark, of Sandon. Two substantial and well-built 16- by 24-foot cabins and a small stable have been erected.

The general strike of the vein is easterly and westerly, dipping to the south at an angle of from 50° to 71°. The No. 2 level consists of a drift 280 feet long, which develops the vein at a vertical distance of 200 feet below the surface exposures at the old shaft. The fissure-filling encountered in this drift is composed of oxidized and decomposed ledge-matter, in which occur small bunches and sprinklings of galena. Near the face the apparent width of this material is 24 feet. The hanging-wall is well defined and carries a streak of gouge; the true foot-wall had not been encountered at this point. It is promising-looking ground and the continuation of this drift for another 100 feet to explore the ground below the old shaft would appear to be justifiable.

The portal of the No. 3 level lies about 300 feet to the east of and about 200 feet below that of the No. 2. The total amount of drifting and crosscutting done in this level is about 600 feet. The hanging-wall is well defined and dips at an angle of 71° to the south. The filling of the fissure is brecciated and consists largely of siderite. The drift has not been extended far enough to prospect the vein under the last 200 feet of the No. 2 level.

Among other activities around Sandon during the season the following are reported: Johnson & McLanders were leasing at the *Mountain Con;* Bough & McLellan were working at the *Slocan Boy* on Payne mountain; the *Noonday* was worked under lease by Tattery & McDonald; and the *Freddy Lee* by Tatterie Bros. W. G. Clark, who had a few men working at the *Chambers* and *Carnation* groups, has recently taken a lease on the *No. 1.*

Mountain Chief. Situated on the wagon-road, half-way between New Denver and Alamo. The property, which is principally owned by A. W. McCune and the George Hughes Estate, is now being worked under lease by Frank Edwards and associates, of New Denver. It is one of the earliest-known properties of the Slocan and produced a considerable tonnage of high-grade silver-lead-zinc ore during 1892, 1894, and 1897. Since this latter date there are no records of any important production, which was possibly due to the increase of zinc with depth.

The vein, which strikes N. 25° E. and dips at about 45° to the south-east, cuts the steep hillside at an oblique angle; the most southerly outcrops are about 200 feet above the wagon-road, while those at the northerly end are some 500 feet higher up the hill. The formation consists of slate and limestones of the Slocan series. The vein has been faulted to the east in several places and the old workings have developed two distinctly separate ore-shoots—one near the southern end and the other near the northern, the latter being by far the most extensive. These workings are mostly caved in, but from what little that could be seen the vein has a width of from 3 to 10 feet where stoping has been done.

Several crosscuts driven from the surface tap the vein at no great depth, and from these drifting and stoping has been done, which constitute the principal workings. The most extensive work has been carried on from the upper level, from which the ore has been stoped to the surface in a number of places.

The dump represents a considerable tonnage, but it is so badly mixed with waste that it is doubtful if it could be reclaimed at a profit, although a small tonnage might be recovered by careful hand-sorting; for instance, a selected sample from this dump ran: Silver, 158.6 oz.; lead, 29.3 per cent.; zinc, 28.4 per cent. A sample taken from about 40 tons of ore piled near the portal of the lower tunnel ran: Silver, 49.3 oz.; lead, 7.6 per cent.; zinc, 27.1 per cent.

It is interesting to note than the zinc-blende in this vein invariably carries good silver values, and in this connection there is in all probability a considerable tonnage of zinc-blende available in the old workings, which was neglected when the property was being mined many years ago. A sample of zinc-blende of the typical "black jack" variety, taken from an exposure of 1 foot in width near the top of a shallow shaft, ran as follows: Silver, 39.4 oz.; zinc, 55.4 per cent.

Providing a suitable market can be obtained for zincky ores, the prospects of this property of again becoming an important producer would appear to be encouraging.

Bosun. This property has been operated steadily during the year by the Rosebery-Surprise Mining Company under the supervision of J. P. McFadden. The number of men employed averaged about twenty-five. During the first seven months of the year work was confined to development and exploration. Shipments were resumed on August 21st. The discovery of a parallel vein on the hanging-wall side between the Nos. 4 and 6 levels came at a most opportune time, and not only gave new life to the property, but has greatly increased its possibilities. At the time of the writer's visit on September 27th, ore was being stoped from this and the original vein between the fourth and fifth levels. The ore occurs in tightly frozen lenses in a slate formation, both as clean galena and zinc-blende. The galena carries about 150 oz. in silver and the zincky ore about 100 oz.

Mining was being done by hand, which was found in this case to be more satisfactory than the use of machine-drills. The ore is sorted before shipment, there not being a sufficient tonnage developed at the present stage of operations to warrant the starting up of the company's large mill at Rosebery.

Standard.—Operations have been suspended by the Standard Silver Lead Mining Company at this property, which is now being further exploited by Clarence Cunningham, who has had a few men at work during the season. Information regarding the nature of the transaction between Mr. Cunningham and the company has not yet been received.

SLOCAN CITY MINING DIVISION.

Ottawa.

This property is situated on Springer creek at an elevation of about 4,600 feet and at a distance of 5 miles by road from the railway at Slocan City. The history of the mine dates back to the early nineties, but apparently it was not until 1902 that extensive mining and development work was attempted. In this year the property was acquired by a Pittsburg syndicate, of which T. A. Noble was president and R. J. McPhee was mine manager.

In 1904 it is recorded that shipments amounted to 1,330 tons and the net profit for the year was $70,000.

In 1913 it was bought by the Consolidated Mining and Smelting Company, which worked it until 1918. Since then it has been worked under lease by P. McGuire and A. L. McPhee, who confined their attention during the first two years of the lease principally to sorting and shipping ore from the dumps.

In 1920 H. L. Biggar purchased a half-interest in the lease and mill-construction was started in September under his supervision, but owing to unavoidable delays it was not completed until August, 1921.

The ore-deposits occur in a sheared fissure in granite. The character of the ore-bodies would indicate that they owe their origin to replacement by the circulation of mineral-bearing solutions or vapours through small channels and filling interstices in the sheared material between the walls of the fissure, and that continuity might be expected with depth.

The ore occurs in lenses of considerable dimensions, the stoping width being as great as 8 feet. The ore is essentially a "dry" silver ore consisting of argentite, with which is occasionally associated small leaves of native silver, the latter, no doubt, being of secondary origin. The gangue is quartz and country-rock. In places barytes is the predominant gangue and is invariably associated with high values. It is both a difficult ore to sort and to recognize underground, as often lean-looking material will run well in silver.

In the past only the highest-grade ore was shipped owing to the difficulties presented by the concentration of the silver minerals. Hence the dumps contain some high-grade and a considerable tonnage of second-grade ore, while there is a possibility of winning a fairly large tonnage of mill-feed from the old stope fillings.

The fissure dissects the hillside in a northerly and southerly direction and dips at 37° to the east. The mine has been opened by five adit-tunnels at vertical intervals of 100 feet. The uppermost, or the No. 1, is the old original prospect-tunnel and is no longer of any consequence. The Nos. 2, 4, and 5 are in good condition and the No. 3 is caved. Below the No. 5 there is still another level, the No. 6. This does not come out to the surface and is now full of water. It is interesting to note that the ore-shoots showed a marked increase in size as depth was gained.

The ore has been stoped out above the No. 5, although there are places from which small tonnages can be mined, while further prospecting on the hanging-wall side may reveal the presence of parallel shoots. By a rough estimation the dumps contain about 25,000 tons, in which the values are bound to be "spotty." In order to arrive at an estimate of the tonnage suitable for mill-feed extensive and costly sampling would have to be undertaken. Shipments made so far have been encouraging; for instance, 700 tons shipped in 1919 averaged 19.8 oz. in silver, while another 700 tons recently treated by the mill averaged 12 oz. in silver.

The mill is on Springer creek, at an elevation of about 1,000 feet below the No. 5 tunnel. It is supplied by a 2,000-foot 2-bucket tram, the upper terminal of which is on a level with the bottom of the No. 5 dump. The rated daily capacity of the mill is 50 tons. The flow-sheet is as follows: The tram discharges into a 45-ton storage-bin; the ore is then fed over a 1-inch grizzly to a 7 by 10 Blake crusher; then to a 40-ton feed-bin, from which it is fed direct to a 5- by 22-foot tube-mill; the discharge from this goes to a drag classifier; the oversize is kept in closed circuit with the tube-mill and the overflow constitutes the feed for the flotation-machine, it being 98 per cent. minus 100 mesh. The flotation-machine is a 9-cell M.S. type. Concentrates are taken off from the first four cells; the remaining five cells make middlings which are kept in closed circuit with the machine. Tailings made in the last cell go to waste. The plant is run by water-power developed from Springer creek under a head of 290 pounds. The average power used is about 100 horse-power.

Some little delay was caused by the silex liner of the tube-mill and difficulty was experienced in getting suitable pebbles, so it was decided to insert a steel liner and replace the pebbles with steel balls. This change has resulted in increased efficiency.

The first shipment of 20 tons of concentrates was made on November 9th. This contained 308.5 oz. of silver to the ton and gave net returns of $3,989.48. The ratio of concentration for this shipment was about 35 to 1 and the average values in the feed were 12 oz. in silver to the ton. The cost of reclamation and treatment of the dumps is estimated at $2 a ton. The crew consists of twelve men, six of whom are employed at the mill.

This is the first attempt made in the district to concentrate this class of ore, and the results will have an important bearing on many of the properties in the "dry ore" belt.

Tamarack. This property adjoins the claims of the *Ottawa* group to the west and comprises the following claims: *Tamarack*, *Falls View*, and *Essie*. Malcolm Cameron, of Slocan, who is a part owner, has been engaged at development-work during the year. The vein occupies a sheared fissure in granite, dipping at an angle of 30° to the south and striking due east. The ore is a "dry ore" similar to that of the *Ottawa*.

In 1905 extensive drifting was done on the vein by three adit-tunnels at vertical intervals of 80 feet. The uppermost, or No. 1, has been driven at an elevation of 4,600 feet or about 1,200 feet above Springer creek. It consists of a drift 206 feet long. The vein is continuous for the whole length of the tunnel. Recently ore was struck near the end, where the vein widens, and carries a pay-streak of from 18 to 24 inches. A composite sample taken at the face across these widths gave the following returns: Silver, 32 oz. This ore extends back into the drift for about 10 feet, when the vein becomes narrower and the filling more mixed.

The No. 2 tunnel, which is in 270 feet, only developed ore near the portal. A few car-loads were extracted from this shoot during the early history of the property and the ore was followed by a raise to the No. 1 level, above which it was continued for 45 feet. The remaining values at this point are confined to small streaks and pockets. A sample across narrow widths ran: Silver, 43.8 oz.

No ore was developed in the No. 3 tunnel, which is in about 330 feet. In this tunnel a fault-fracture was encountered. The walls are slickensided and the filling consists of crushed and decomposed granite.

The results obtained by recent work in the No. 1 tunnel are encouraging, more especially since it has recently been demonstrated that this class of ore is amenable to concentration by the flotation process. At present hand-sorting and cobbing is necessary before shipment. This is expensive, as the ore is both difficult to sort and extremely tough and hard to break.

Arlington. This property is situated near the head of Springer creek at a distance of about 8 miles by road from Slocan. It is owned by the Rithet Estate in Victoria. The claims were staked as early as 1894 by C. E. Fielding. According to the only old records available, the mine reached its apex of production in 1901, when it

headed the list of Slocan shippers with a production of 5,283 tons for the year. In 1904 the mine was temporarily closed down and reopened in 1905. Steady production was maintained until 1908. The ore shipped is reported to have averaged about 75 oz. in silver and 5 per cent. lead to the ton.

In 1918 M. S. Davys, of Kaslo, took a lease on the dumps, from which he shipped some 500 tons. The ore was not carefully sorted and the values proved disappointing. The ore, consisting of grey-copper, antimonial sulphides of silver, and a little galena, is reported to have occurred in narrow lenses, stringers, and "kidneys" throughout a crushed zone in granite having a width in places of 70 feet. In order to win this ore it was necessary to mine a large percentage of second-grade material which would not stand shipment and had to be hand-sorted. The dumps give evidence of this method having been resorted to. Failure to find a suitable method of concentration during the period of operation was probably the primary cause of closing down.

The mine was opened by three adit-tunnels—namely, A, B, and C. A level gained a vertical depth of 150 feet below C; B level was driven at 100 feet above A. The principal stoping was done betwen B and C levels; on the former, according to old maps, it is continuous for over 1,000 feet along the strike of the deposit. A level is caved and partly full of water. Some of the old workings are still accessible from B level, in which several small lenses of good ore are exposed.

In reviewing the data from old records it is evident that a large tonnage was produced in proportion to the amount of development-work done in the ore-bearing zone. The occurrence of ore throughout a wide zone of shearing would suggest that more crosscutting might have been done to advantage, while there is no reason to suppose that the ore pinches out below the 150-foot or A level.

For the successful operation of this property, providing sufficient ore is developed, a concentrator would seem to be a necessary adjunct. To reopen the mine with a view of again placing it on a productive basis, it would be necessary to clean out and retimber A tunnel, from which level further exploratory and development work could be carried on.

R. R. Hedley, who acquired a lease on the property this year, has been engaged in investigating such of the old workings as are accessible and sampling the dumps, which contain by a rough estimate some 10,000 tons. The results of a number of assays of ore picked from the dumps indicate that it cannot be hand-sorted profitably, as that carrying high silver values closely resembles low-grade ore, and vice versa.

Silver Crest Group.*

This group, consisting of the *Silver Crown*, *Silver Banner*, *Silver Bugle*, *Silver Crest*, and *Silver Bell* claims, is situated along the precipitous summits on the southern side of the headwaters of Lemon creek, about 17 miles by road and trail from Kootenay lake (8 miles by the old wagon-road up 6-Mile creek from Willow Point; thence about 9 miles by trail up Lemon creek). The property can also be reached by the trail up Lemon creek from the Slocan River valley, which route is also about 17 miles in length. The claims, which are recorded in the name of H. G. Harding, secretary of the McLeod-Slocan Mining Syndicate, formerly constituted the *German* group, abandoned by the owner, Henry Reichert, when he left the country in 1916. Reichert was responsible for most of the work done on the property (chiefly open-cuts). R. G. McLeod (president of the syndicate) and associates did some work stripping the outcropping of the vein on the *Silver Crest* claim in the summer of 1921.

At the time of the writer's visit there were eight men in addition to Mr. McLeod and his family at the property. A few of the men were employed in making an open-cut in the lead on the summit of a precipitous bluff at 8,500 feet altitude. This bluff falls abruptly for 1,400 feet towards Lemon creek and the workings are reached by a roundabout route which culminates in the glacial basin behind and a few hundred feet below the summit. From the cabin at about 6,800 feet altitude it takes over an hour of stiff climbing to get to the workings.

The mineralization occurs in a fissure-vein in granite. A basic micaceous dyke follows close to the vein on the hanging-wall side. The strike of the vein conforms to the trend of the summit of the mountain (north-easterly and south-westerly) and the dip is steeply into the mountain, or south-easterly. The vein varies in width from 10 to 12 inches where exposed in the open-cut and the wall-rocks are rusty-looking and decomposed for several feet. The associated minerals are pyrite and galena carrying gold and silver values in a gangue of decomposed quartz and

granite. A sample across 10 inches gave: Gold, 1.82 oz.; silver, 18.1 oz.; lead, 7.6 per cent. The comparatively high gold values may be due to a local concentration of the metal from oxidation of the pyrite. On account of its inaccessibility exploitation of the outcrop will be difficult and a considerable outlay will be necessary before the property can be brought to a producing stage.

White Heather.* This claim, situated at the bottom of the mountain on which the *Silver Crest* group is located, was formerly part of the *German* group, but was recently relocated by J. Law and T. Armstrong. At an approximate elevation of 7,200 feet an open-cut has been made in the outcrop of a lead striking northerly and southerly and dipping about 60° easterly, or into the mountain. The material exposed in the open-cut is oxidized and decomposed, resembling ledge-matter.

About 100 feet vertically below the open-cut a 150-foot crosscut tunnel intersects the lead, which was drifted on for 300 feet southerly. Here the lead, 5 to 6 feet wide, is composed of siliceous porphyritic rock containing stringers and bunches of oxidized material which carry values in silver and gold. The only ore-mineral noted was pyrite. Selected specimens of this oxidized material gave: Gold, 0.04 oz.; silver, 15.6 oz.

About 40 feet vertically below and a short distance from the above tunnel an open-cut has been made in a 6-inch quartz vein having an approximately similar strike and dip. In this vein the quartz is considerably leached, but a little galena and pyrite were noted. A sample across 6 inches gave: Gold, 0.22 oz.; silver, 9.2 oz.; lead, 0.1 per cent. Sixty feet vertically below this open-cut a 60-foot crosscut encountered the vein, which at this point only amounted to a seam, no drifting being done.

Soldier Boy.* This claim, owned by J. Law and T. Armstrong, is situated about half a mile south-westerly from the *Silver Crest* group on the same mountain. Siliceous stringers containing silver sulphides occur in a sheared fissure in granite. This fissure, of indeterminate width, strikes almost vertically across the mountain towards the south-east, or approximately at right angles to the trend of the summits. As the lead outcrops up the face of a precipitous bluff, work has been confined to the only two accessible points, which are the top and bottom of the bluff. The upper workings are reached by a circuitous route over the rugged ground south-west of the bluff.

At the top stringers of ore are exposed in open-cuts at elevations of 7,875 and 7,850 feet. An average sample of 3-inch pay-streaks in these open-cuts gave: Gold, 0.04 oz.; silver, 72.9 oz. About 25 feet vertically below the lower of these cuts a 70-foot crosscut just reaches the lead, which was not drifted on. This tunnel was driven at great personal risk to the owners, who lowered themselves to work on a rope with powder, steel, and timbers.

Below the portal of the tunnel the bluff falls almost vertically for 1,400 feet towards Lemon creek. At the bottom of the bluff, at 6,400 feet elevation, stringers of ore are exposed in an open-cut. Specimens of ore from this cut gave: Gold, 0.46 oz.; silver, 73.7 oz.

Barnett Group. This group, which originally consisted of the *Barnett, Little Montana,* and *Pulaski* Crown-granted claims, is situated at an approximate elevation of 6,600 feet on the northern side of Lemon creek, a little to the west of its intersection with the Third North fork. To get to the property the route followed is from Willow Point, on the West arm of Kootenay lake, 8 miles by the old wagon-road up Duhamel creek; thence via Oro up the Lemon Creek trail about 7 miles; thence up a branch trail 1¼ miles, making the total distance from transportation about 16¼ miles. The property can also be reached by the Lemon Creek trail from the Slocan River valley, which route is about the same length.

The property was examined following an application for assistance towards cost of making repairs to the trail leading to it. R. G. McLeod and associates did a little work on the *Barnett* claim in the summer of 1920. This work chiefly consisted in driving a short length of tunnel. The old workings, which date back to the early days of the camp, consist of some short tunnels, open-cuts, and trenching.

The mineralization occurs in a flat-lying quartz vein in granite. Adjoining the vein the country-rock is rusty-looking, soft, and decomposed. The vein will average about 15 inches in width, but good values are also obtained from a band of altered porphyritic granite in the foot-wall of the vein, which band varies in width from 6 to 12 inches or more.

The ore-minerals noted were pyrite, argentite, and "black sulphurets." The ore so far exposed is chiefly found within a length of 200 feet along the outcrop of the vein, which follows the contour of the hill in a northerly and southerly direction. Three short tunnels crosscut this ore-shoot, but the vein is so flat that it remains in the tunnels throughout their entire length (the longest tunnel is 150 feet in). There are patches of ore in all three tunnels. On account of the soft, decomposed nature of the granite considerable timber is required to support the roof. The winning of ore from a small vein under these conditions is difficult and expensive.

Samples taken gave as follows:—Selected specimens of quartz containing "black sulphurets": Gold, 0.42 oz.; silver, 52.3 oz. Grab sample from small pile of sorted ore: Gold, 0.79 oz.; silver, 74.2 oz. Sample across 6-inch band of porphyritic granite in the foot-wall of the vein: Gold, 0.68 oz.; silver, 141.9 oz.

Laboratory tests show the ore to be well adapted to the flotation process, but a considerable outlay will be necessary on development with a view to assuring the ore-supply which would warrant the installation of a small plant.

Black Prince.—Situated at a distance of 9 miles from Slocan and operated by J. T. Tipping. The property has been a small but steady producer for a number of years. The principal values are in silver.

Anna.—Situated near the *Ottawa* on Springer creek. The property is owned by K. Zimmerman, who operated it during the early part of the year and made a small shipment to Trail. The ore is the characteristic "dry ore" of this district and carries high silver values.

L.T. Group.—Situated at about 3 miles from the *Ottawa*. D. B. O'Neail, of Slocan, who is the principal owner, put in a season's work at the property.

Hampton.—Situated near the head of Springer creek and worked under lease by Barber, Wafer & Moran. The results of the season's work were encouraging and development will be continued during the winter months.

NELSON MINING DIVISION.

There has been more than usual activity among the gold properties of this Division during the past season, though most of the work has been confined to prospecting and development, the results of which it is hoped will be manifested in the near future by additional mines on the shipping-list.

The principal source of production has been from the Nugget Gold Mines, Limited.

The principal lead-producers of the Division—namely, the *Molly Gibson* and the *Emerald*—have experienced a quiet season. The former property, which belongs to the Consolidated Mining and Smelting Company, has been leased to W. A. Cameron, who intends to employ a small crew of men at the mine this winter. During the summer the aerial tramway was partly destroyed by fire.

Nugget Gold Mines.

Harold Lakes, the manager, reports that milling operations commenced on April 28th and ceased on November 1st. During this time 10,920 tons of ore was mined and milled; the estimated recovery is $68,637. The average number of men employed when running at capacity was forty at the mine and fifteen at the mill, which latter included office staff, superintendent, assayer, etc. During the winter eight men will be employed at development of the *Nugget* vein.

Reno.

W. B. Pool, who for a number of years has been systematically uncovering a series of gold-quartz veins by trenching and open-cuts, has now formed the Reno Gold Mines, Ltd., of which he is president, T. Kilpatrick vice-president, and James O'Shea secretary. The capital of the company is $1,000,000, divided into non-

assessable shares of $1 each. It is understood that the intention is to first prove the veins at depth by drifting from the surface and crosscutting; then, if results are satisfactory, to install the necessary plant for mining and treatment of the ore.

Bayonne.—This property is under option to John B. White and associates, of Spokane. About 15 tons of winter supplies have been packed in over the Sheep Creek trail from the end of the wagon-road at the *Motherlode* mill. About ten men will be employed through the winter under the management of B. N. Sharp. The ore is gold quartz occurring as a fissure-vein in granodiorite.

Spokane Group.—Situated near the head of Canyon creek. As a result of steady work extending over a number of years, Laib Bros. (the owners) now have a considerable tonnage blocked out. The principal values are in gold and silver.

California-Athabasca.—These properties are being operated by the California Mining Company. Further improvements have been made to the mill and it is confidently expected that the property will be on the shipping-list next year.

Granite-Poorman.—This well-known property was acquired early in the year by the Granite-Poorman Mines, Limited, in which A. C. Bowness and associates are principally interested. Underground and surface exploration have been steadily proceeded with. During the winter it is proposed to do an additional 50 feet of tunnelling and 250 feet of raising under contract.

Gold Hill.—This property has been worked for the last two seasons by George Gormley. During the year 96 tons of ore was shipped to Trail. The principal values are in gold and copper, the former occasionally running as high as 5 oz. to the ton.

Champion.—Situated near Park Siding, on the Great Northern Railway. S. N. Ross put in a season's work at the property. A shipment of 20 tons of gold-quartz ore was made to Trail.

Monarch.—Situated near Hall, on the Great Northern Railway. J. Fisher has taken in a diamond-drill outfit with the intention of working during the winter.

Silver Reef Group.

This property, comprising a group of four claims—namely, the *Rover*, *Silver Reef*, *Butte City*, and *Pictou*—is owned by W. J. Richards, of Nelson. The claims cover an area between the two forks of Anderson creek and are conveniently situated to the Great Northern Railway at a point about 3 miles east of Nelson. Good water for camp purposes and timber for mining are available in the immediate vicinity of the workings.

The vein, which has a strike of N. 20° W. and an almost vertical dip, cuts a formation of granodiorite which forms a rounded ridge between the two small branches of the creek. It is a well-defined true fissure-vein in which the typical banded structure is well developed. The vein-filling is of white quartz in which the ore occurs in two distinct bands, presenting a ribbon-like structure.

Some years ago a drift was run in a southerly direction from the bank of the North fork, developing good backs and establishing the continuity of the vein for 260 feet. The average width is apparently about 2 feet, though this could not be accurately determined, as the vein could only be seen at intervals through the lagging. The granite on the west wall is soft and decomposed, while on the other wall it is more massive.

At a point 260 feet from the portal there has been a movement which has somewhat complicated matters, and for 70 feet the vein swings to the east and is not so strongly defined, leaving doubt as to whether it is the true continuation of the vein. A lamprophyric dyke which seems to follow the line of fissuring is noticeable, and at the face of the drift forms both walls of the vein. In the opinion of the writer the continuation of the vein at the end of the drift will probably be found to lie between the granite and the dyke; the latter, being post-mineral, may have either caused faulting or splitting of the vein; hence a little crosscutting near the end of the drift would seem advisable, or, if the overburden is not too great, trenching vertically above the change in direction of the vein should be a valuable guide to future underground work.

At a point 200 feet from the portal the vein has been stoped to a height of about 35 feet above the tunnel. This stope has a length of about 35 feet. A composite sample across an average width of 8 inches from three different places up the ladderway gave the following results: Gold, 0.12 oz.; silver, 4.8 oz.; lead, 14.5 per cent.; zinc, 11.7 per cent.

The ore consists principally of a mixture of coarsely crystalline galena and zinc-blende, carrying values in gold and silver.

Humming Bird.* This group, consisting of the *Humming Bird* and *Queen Elizabeth* claims, owned by Robert Qua and R. G. Joy, of Nelson, is situated at the head of 5-Mile and Roaring creeks at an elevation of from 5,400 to 5,600 feet. To get to the claims the present route is by a trail about 10 miles in length from the Mountain Station at Nelson. This trail, which contains many steep pitches and adverse grades, follows the heights on the eastern side of Cottonwood creek, more or less parallel to the Great Northern Railway, whereas a much easier trail about 4 miles in length could be constructed down Roaring creek to connect the property with Apex.

The geological formation of the area embraces slates, phyllites, and schists, in which bands of quartzite and limestone occur; the whole being classified as the Nisconlith series. To the south and south-east of the series there is an extensive belt of granite. In the immediate vicinity of the workings the country-rocks are quartzite and siliceous schist.

Following the discovery of some rich gold-bearing float in the bed of a small creek (tributary to 5-Mile creek just below the watershed separating that creek from Roaring creek), the owners did considerable ground-sluicing in heavy wash, which resulted in the uncovering of segments of two parallel veins a little above the creek-bed.

The veins are well defined between smooth walls conforming to the stratification of the enclosing rocks, which dip at about 39° towards the south-east, or into the hill. The associated minerals are galena, zinc-blende, pyrite, and arsenopyrite, with some free gold, in a quartz gangue.

High gold values are associated with the arsenopyrite, which fills small cavities and vugs in the quartz, while appreciable amounts of coarse gold can be panned from quartz which shows a layer-like or "ribbon" structure. There is generally little oxidation in evidence to which local concentration of the metal could be attributed, even barren-looking quartz giving colours on panning.

The upper vein, from 1 to 2 feet in width, is partially exposed along its outcrop for a distance of 100 feet, with an open-cut at the north-east end and a 10-foot incline shaft at the south-west end. The open-cut is in an ore-shoot of which a length of about 10 feet is exposed so far (heavy overburden covers the north-easterly continuation of the ore-shoot). An average sample across 2 feet in the open-cut gave: Gold, 6.26 oz.; silver, 3.9 oz.; lead, 5.5 per cent.; zinc, 1.9 per cent. Selected specimens of quartz and arsenopyrite from the same place gave: Gold, 3.14 oz.; silver, 2.3 oz.; lead, 2.4 per cent.; zinc, 0.4 per cent.

The lower vein, which is about 50 feet from and a little below the upper vein, is about 30 feet vertically above the creek-bed. Segments of this vein, exposed in two open-cuts 50 feet apart along its outcrop, show an average width of 1 foot. In these cuts the quartz is sparingly mineralized, but further work along the strike may disclose an ore-shoot.

The showing in the open-cut on the upper vein is very attractive and may be the commencement of an ore-shoot of appreciable length. The prospect has many natural advantages, situated as it is at a comparatively low altitude, within easy reach of the railway (if a trail is built to Apex), and having a plentiful supply of timber for mining purposes close at hand, while water-power could probably be cheaply developed on Roaring creek at a short distance from the claims.

Big Porcupine.* This claim, same owners, is situated above the *Humming Bird* group at an elevation of about 6,300 feet (cabin). Two parallel quartz veins, containing bunches of silver-lead ore of the concentrating type, cut the granite in an easterly and westerly direction, with average dips of about 30° to the north. The veins vary in width from 4 to 7 feet and are about 300 feet apart (roughly estimated), being developed by two shallow incline shafts and some open-cuts, in which is exposed some galena, zinc-blende, and pyrite disseminated through the quartz. No samples were taken by the writer, but assays are said to have returned as high as 40 oz. silver to the ton.

United Verde.* This property (formerly the *Southern Belle*), consisting of the *Melrose*, *United Verde*, *Victoria*, *Silver Tip*, and *Jessie* claims, owned by the Trail Mining Company (J. Rozeck, superintendent), is situated on Wilson creek about 3 miles by trail from the end of the wagon-road at the Lost Creek bridge, or a total distance of 12 miles from Salmo. The old workings are described on page 172 of the Report of the Minister of Mines for 1918. In this year the *Southern Belle* group and adjoining claims were acquired by

Kitchener—C.P.R. Iron Properties.

Kitchener—C.P.R. Iron Properties—Diamond-drill Hole.

UNIVERSITY OF ILLINOIS LIBRARY

the present owners from C. E. Wilson, of Salmo. Since then considerable work has been done, including about 675 feet of tunnelling (up to the time of the examination in May, 1921).

The new work consists of a 600-foot crosscut, gaining a depth of several hundred feet on the old workings, and some drifting on the leads. The crosscut intersects two parallel quartz veins which strike N. 50° E., with dips varying from 70° to 76° to the south-east, or into the mountain.

The principal lead, encountered in the crosscut at 580 feet from the portal, is 15 feet wide, between smooth, clearly defined walls, from which the ore breaks freely. Galena is irregularly disseminated in bunches and stringers throughout the entire width of the lead, which was drifted on for 30 feet. This drift, widened to the full width of the vein, showed mineralization throughout, with ore in both faces. A sample across 15 feet gave: Gold, 0.08 oz.; silver, 12.9 oz.; lead, 21.6 per cent.; zinc, 1.3 per cent. According to recent reports this drift has since been continued some distance with good results.

From the intersection of this big vein in the crosscut to its outcrop there is an estimated depth of 375 feet of stoping-ground. The other vein, which amounted only to a stringer where encountered at 360 feet from the portal, widened out to 30 inches when drifted on for a short distance. A sample across 30 inches gave: Gold, 0.06 oz.; silver, 4.3 oz.; lead, 8.2 per cent.; zinc, 5.4 per cent. From the intersection of this vein in the crosscut to its outcrop there is an estimated depth of 250 feet of stoping-ground. A further depth, roughly estimated at 600 feet, could be gained on the present lowest workings by tunnelling.

The company has acquired water rights for power purposes on Wilson creek and the South fork of the Salmon river with a view to the erection of a small concentrator.

High Ore.* This property, consisting of the *Good Hope*, *Gold Note*, *Free Gold*, *High Ore*, and *Mika Chaka* claims, owned by Alec. Long, of Nelson, is situated at an elevation of about 3,500 feet (cabin) on the mountain-slope about three-quarters of a mile westerly from Eagle creek, and is reached by a trail about 1 mile in length which branches off the upper *Granite* road at Eagle creek. The total distance from Nelson to the claims is about 6 miles.

Two parallel quartz veins cut the granite formation in a southerly direction, or straight up the mountain, dipping at about 60° to the east. The veins, which are about 250 feet apart, vary in width from 6 inches to 2 feet.

Free gold occurs chiefly in the leached and oxidized portions of the veins, which have been opened up for several hundred feet along the surface by means of short tunnels and open-cuts. Six samples taken at different points across widths varying from 6 inches to 2 feet gave an average value of $6.20 in gold to the ton. The highest values are probably confined to streaks and lenses in the veins.

Kitchener Iron-deposits.

A long string of claims comprising four groups cover an iron-bearing zone, which crosses the Crowsnest Pass Railway at a point near Kitchener and extends in a northerly direction, paralleling Goat river for a distance of approximately 8 miles. The *Great War* group, owned by the British Columbia Iron Company, and the *Iron Mask* group, owned by R. Lamont and associates, of Creston, lie to the south of the Crowsnest Pass Railway and extend to the headwaters of the Little Moyie river. Another group, known as the *C.P.R.* group, covers all of the principal surface showings north of the railway and extends some 8 miles up Goat river. Adjoining these claims there is still another large group owned by C. P. Hill. On this latter group very little prospecting has been done so far.

Geology.

This area is underlain by quartzites which have been classified by Dr. S. J. Schofield, of the Geological Survey, as belonging to the Aldridge formation of Pre-Cambrian age. These rocks have been intruded by a wide dyke of diabase, distinctly green in colour and varying in texture from a granitoid to a finely crystalline rock. It can be easily distinguished in the field from the more common diorites and gabbros forming the Purcell sills. It outcrops at intervals along a persistent strike of about N. 10° W., sometimes forming big masses of over 1,000 feet in width and at others forming dyke-like intrusions. The quartzites show many variations in dip and strike, and in places where there has been intense shearing have been converted to rocks resembling chloritic schists along a narrow margin of their contact with the green igneous rock.

This is noticeable at the head of Thompson creek. The diabase has also been subject to shearing and has been altered to chloritic schists in certain localities. Owing to the hillsides being covered with brush and overburden the lateral boundaries and continuity of the diabase have been difficult to trace, and further prospecting may yet reveal that it covers a far greater area than the present exposures would indicate.

The important feature of this intrusion, from an economic standpoint, is that hæmatite is found to occur always associated with the diabase, either in the rock or near its contact with the quartzites. The largest bodies of hæmatite so far discovered occur along the contact of the quartzite and dyke and constitute wide bands of high-grade hæmatite, which gradually grade into lean siliceous ore, due to the process of replacement of the quartzite wall.

In places the hæmatite forms a matrix of a siliceous breccia; it also forms veinlets both in the quartzite and dyke-rock. Taking these facts into consideration, and as both the quartzites and dyke-rock show evidence of shearing, it would seem reasonable to assume that subsequent to the intrusion of the latter a zone of fracturing was formed having a northerly and southerly trend and closely following the line of contact. That channels were thus provided for the iron-bearing solutions and ore-bodies were formed along the line of least resistance, both in the quartzite and diabase. The iron, probably originating from the same magma as the dyke-rock, represents a different phase of its mineralization.

C.P.R. Group. This property, comprising thirty-two Crown-granted claims, extends from a short distance north of the Crowsnest Pass Railway for about 8 miles up Goat river. The group consists of Lots 5765 to 5787 (inclusive), 5790 to 5795 (inclusive), and Lots 5835, 5839, and 5840. Registration is in the name of the Royal Trust Company. The claims are staked along the summit of the ridge which forms the divide between Goat river and Arrow creek. On the easterly side the slope of the ridge is dissected by small creeks. These terminate in basins at 1,000 feet or so below the summit, leaving bluffs and escarpments above. On the western side the slopes are more uniform and gradual. The elevation of the surface exposures, on which most of the work has been done, is about 6,000 feet, or some 3,000 feet above Goat river.

Past History.—The claims were originally located in about 1899 by C. P. Hill and were bonded to the London and British Columbia Gold Fields, who primarily confined their attention to prospecting for copper. At this time, probably due to the Rossland excitement, it may be noted that every iron-capping in the country was staked, not for iron, but for the possibilities of finding copper beneath the iron-stains, so this particular area proved an attractive field for the prospector.

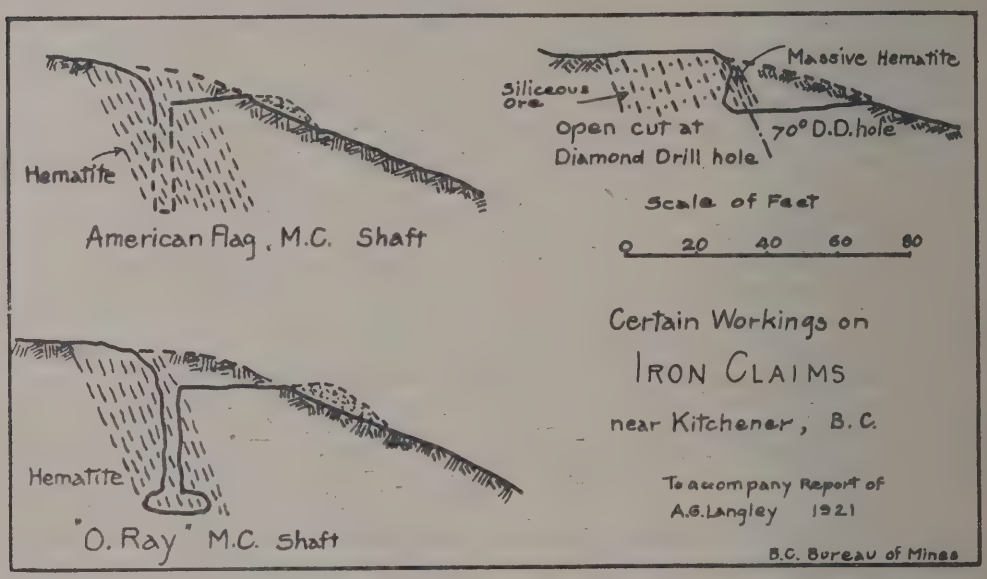
In 1901, C. P. Hill, acting on the advice of W. Blakemore, consummated a deal with a Montreal syndicate closely allied with Canadian Pacific Railway interests and composed of Lord Shaughnessy and associates. Prospecting and development work was done in 1901 and 1902.

Camp.—The camp is situated at an elevation of 6,150 feet on the summit of the ridge between Goat river and Arrow creek. The distance by trail from the railway is about 12 miles. The buildings consist of three cabins, all of which are in a fair state of repair.

Workings.—The most northerly working visited by the writer is on the *American Flag* claim at a short distance from the camp. Here a deep open-cut has been driven across the vein and a 35-foot shaft sunk on the foot-wall side. The shaft was full of water, but it was evident from the dumps that it had been sunk in ore. A sample taken across 10 feet of hæmatite exposed at the top of the shaft assayed as follows: Iron, 55 per cent.; sulphur, trace; phosphorus, *nil;* silica, 6.1 per cent. The ore is a massive black hæmatite which breaks easily under the hammer. The strike of the vein at this point is N. 10° W. and dip 75° to the west, with the slope of the hill, which is about 25°.

The next working is situated at approximately 1,500 feet to the south, on the *O'Ray* claim. At this point another 35-foot shaft has been sunk on ore. At the bottom of the shaft an 18-foot crosscut has been run from wall to wall. Across this width a representative sample was taken, which ran as follows: Iron, 55.2 per cent.; sulphur, *nil;* phosphorus, trace; silica, 7.9 per cent. The wall-rock exposed in either face of the crosscut was decomposed quartzite heavily impregnated with iron. The same dip and strike maintain here as at the *American Flag* shaft. Other work indicates that the ore-body extends for at least 150 feet south of the shaft. Throughout the iron-bearing zone the ore probably occurs in lens-like bodies, and, as the conditions at the

above-mentioned shafts are similar, there is just a possibility that they may both be sunk on the same lens, although there has been no work done to prove the continuity of the ore between them. On the assumption that they are on the same ore-body, a conservative estimate of the possible tonnage would be as follows: 1,500 feet by an average width of 14 feet by a depth of 1,000 feet gives over 2,500,000 tons. Should there be two separate lenses, there would be a possible tonnage of between 800,000 and 1,000,000 tons, providing the ore is continuous to a depth of 1,000 feet.



At a distance of about 2,000 feet in a southerly direction from the *O'Ray* shaft another shaft has been sunk for a distance of 30 feet. It is now filled in, but there is high-grade hæmatite on the dump, the proved width of which is said to have been 9 feet.

The next showing of importance is at the diamond-drill hole on the *Keepsake* claim; this is some 2,000 feet southerly from the last-mentioned showing. At this point the vein has a width of about 50 feet and apparently lies between diabase on the foot-wall and quartzite on the hanging-wall. Its strike and dip are similar to that at the other showings.

The width of the vein across the outcrop is about 50 feet. A deep open-cut has been driven for about 15 feet, exposing in cross-section an 8-foot band of good ore near the hanging-wall; the remaining 42 feet consists of lower-grade siliceous ore. A sample across the 8 feet gave the following returns: Iron, 46 per cent.; sulphur, *nil;* phosphorus, *nil;* silica, 26.5 per cent. This ore is more micaceous than that at the other exposures.

Diamond-drilling was attempted in 1901 with a small gasolene-driven outfit. The hole, which follows the dip of the ore—namely, 70°—is said to have proved ore for 300 feet, but does not give any useful information regarding the width of the ore at this depth. Trenching across the southerly extension of this ore-body has not been adequate, but would indicate the probable continuation of the ore in this direction for at least 200 or 300 feet.

By continuing in a southerly direction along the contact of the dyke-rock and quartzite, numerous other showings may be seen at intervals from the camp to Goat river, some of which indicate the presence of either parallel or nearly parallel veins, accompanied by offshoots from the main igneous mass.

The same character of ore and similar geological conditions are found to prevail at the head of Thompson creek, at a distance of about 4 miles south of the railway, though the continuity of the zone has been interrupted by a big break in the formation, through which Goat river flows in a south-westerly direction.

Conclusions.

The above brief description suffices to show that the hæmatite is distributed over a big area, and that it is invariably associated with the intrusive dyke of diabase, which latter represents an immense mass of igneous rock extending for many miles in a northerly and southerly direction. Such conditions would appear favourable for the deposition of large ore-bodies in certain localities.

The strong showings opened up by surface diggings have not been developed sufficiently to define their boundaries, while the surface has not been thoroughly prospected. For instance, it was only last year that a new discovery was made by George Young, when a 12-foot width of high-grade hæmatite was uncovered on the *Pacific* claim, situated about midway between the camp and Goat river.

The property is conveniently situated to the railway and is within easy reach of the Crowsnest coalfields at Fernie, where a metallurgical coke of high quality can be produced. Water-power for mining purposes could be developed at Goat river.

Should the owners decide upon extensive development, their action would be, in the opinion of the writer, fully justified, the field having undoubted potentialities.

TRAIL CREEK MINING DIVISION.

There has been a considerable increase in production of gold-copper ores from the properties of the Consolidated Mining and Smelting Company at Rossland. The tonnage shipped up to the end of 1921 is 82,093 tons.

The properties owned by this company include the *Centre Star*, *Le Roi*, *War Eagle*, and *White Bear* mines, which are all connected by underground workings and constitute one large mine with a total of about 60 miles of underground workings. The amount of ore extracted from this group since 1894 represents about 5,000,000 tons.

Recent developments have proved good-grade ore on the 1,650-foot *Le Roi* level, which corresponds to the 1,400-foot level of the *Centre Star*. From this ore-body one has to travel for about 1½ miles underground to reach the north-easterly end of the mine-workings.

These facts alone leave room for reflection on the great asset these properties have been to the Province, by the employment of labour and wealth of metals produced.

Le Roi No. 2. The production of this property also covers a number of years, dating back to the early nineties. In 1900 the present owning company, the Le Roi No. 2, Limited, was incorporated. Up to 1911 this company paid about $1,500,000 in dividends; later records of results obtained are not available at the time of writing, but no doubt would show considerable profits.

Under the management of D. Lay, the mill has been recently remodelled and a 16-cell, M.S.-type flotation-machine installed. The capacity of the mill is 75 tons a day. Milling operations began in August and over 700 tons of concentrates were shipped to Trail to the end of 1921.

I.X.L. This property was staked in 1891 by Thos. Heady. It is now owned by John S. Baker, of Tacoma, and is being operated under lease by R. B. Shelledy and associates. The claim is situated near the Northport road at a distance of 2½ miles west of Rossland. Old records show that small quantities of high-grade gold ore have been shipped from time to time, the last shipment being made in about 1913.

So far the present lessees have shipped a small tonnage of exceptionally high-grade gold ore. The first shipment of 1,704 lb. returned 183.67 oz. of gold and 29 oz. of silver. The second shipment of 301 lb. of ore returned 140.3 oz. of gold and 23 oz. of silver. These shipments represent values of 215.6 and 932 oz. of gold to the ton of ore, respectively.

Hattie and Richmond. These claims are situated at a distance of 1¼ miles south of Rossland. They are owned by S. Forteath and associates, of Rossland. The country-rock is chiefly composed of a fine-grained monzonite cut by numerous basic dykes.

A series of small tightly frozen veins has been exposed by open-cuts and shallow shafts. These veins have an east-and-west strike and dip at about 75°. The continuity of the mineralization is not pronounced, the ore apparently filling cavities at intervals along a fairly persistent strike. Any one of them taken as an individual deposit would not represent an ore-body of any great commercial importance, as far as could be ascertained by the limited

amount of work so far done. It is possible that at a depth they may show greater strength or consolidate to form an ore-body of considerable dimensions.

Samples taken across narrow widths from the various showings all gave gold values, of which the following are a few examples: A sample across a pocket of oxidized ore 26 inches wide ran: Gold, 2.01 oz.; silver, 1.7 oz. At a short distance from where this was taken, and on the same vein, a sample across 1 foot at the bottom of a shallow open-cut ran: Gold, 0.33 oz.; silver, 5.3 oz.; copper, 5.02 per cent. A sample taken of decomposed vein-matter from one of the other parallel veins ran: Gold, 1.10 oz.; silver, 2.8 oz. The sulphide ore is a mixture of arsenopyrite, pyrite, and chalcopyrite.

To the south of the *Hattie* are the old workings of the *Lily May*, the first property to be operated in the camp. Here a shaft was sunk 207 feet on a vein having a strike of north-east and occurring in the sedimentary rocks of the Mount Roberts formation. The mineralization is of quite a different character to that at the *Hattie*, the principal values being in silver, with which is associated galena, iron pyrites, zinc-blende, and occasionally stibnite in a quartz gangue. Past records show that only very little ore was won from this vein. The principal development-work has been done at a depth, and as the shaft was full of water these workings could not be examined. After lying idle for a number of years active development was undertaken in 1913 by the Richmond Consolidated Gold Mines, Limited, under the management of J. L. Warner.

The following is an extract from a report by the Gold Commissioner in the Annual Report of the Minister of Mines for 1913: "The *Lily May* was unwatered about September 1st, since when underground work was continuously carried on until December 23rd. Some 600 feet of work was done in exploring the *Lily May* vein and in running north and west drifts. In the west drift a large amount of mineralized ground was encountered, but, while occasional assays gave workable values, the average was below that standard. This drift, now heading north, requires to be driven a considerable distance to reach its objective point—namely, vertically under a surface showing that gives high values in gold and copper-gold from $2 to $140 per ton. . . . A northerly drift started from the bottom of the shaft is in 297 feet, and was driven to cut a series of five veins, all cropping within a width of 250 feet on the *Richmond* and *Hattie* claims. This drift will have to be extended 160 feet to intersect the first of these veins."

From the above it will be seen that the exploratory work being carried on at this property had an important bearing on the *Hattie*, and it is to be regretted that the funds gave out before the northerly tunnel had gained a sufficient length to cut the series of veins referred to.

Velvet-Portland.* This gold-copper property is situated 6½ miles south-west from Rossland, on the north-west slope of Sophie mountain, in the valley of Big Sheep creek opposite Santa Rosa creek, and is connected by wagon-road to the Great Northern Railway siding 9½ miles distant (the Rossland branch of this railway recently ceased operations). A full description of the property and its history, which dates back to 1897, is published on pages 154–158 of Geological Survey, Memoir No. 77, "Geology and Ore-deposits of Rossland" (1915).

In 1918 the Granby Company had a lease and bond on the property, and is said to have pumped out the lower levels and to have done some diamond-drilling below the sixth level, where an important body of sulphide ore was encountered. When, however, this company discontinued mining and smelting operations in the Kootenays, it relinquished its lease of the *Velvet-Portland*, which again relapsed into inactivity.

In 1920 the property was acquired by the Rossland-Velvet Mines, Limited, the promoters of which are practical mining and business men of Rossland (E. Nordman, president; J. W. Gregory, secretary). In that year between 400 and 500 tons of ore was shipped to Trail and Northport smelters. Shipments in 1921 amount to 55 tons shipped to Trail (Northport smelter was closed down early in the year).

The ore shipped by the present owners was extracted from stopes on the upper levels south of the main *Velvet* shaft. This area has proved the most productive in the mine and has been fairly thoroughly exploited. The upper three levels are in a zone of marked oxidation, which appears to extend down in places to the fourth level, where the first sulphide ore was encountered. In the zone of oxidation the principal values are in gold.

The present owners intend to continue shipping ore that may have been overlooked on the upper levels, and to drive a tunnel about 1,000 feet to tap the veins at a depth of approximately

250 feet below the sixth level, and get into the ore that was encountered with the diamond-drill, as well as other ore-bodies that may be found. On completion of this tunnel and shaft connection the mine will be drained to that depth, thus eliminating the heavy expense of pumping the water out, a factor which has prevented the present operators from working on the lower levels.

Hitherto the property has been seriously handicapped by the excessive cost of transportation, including the long haul to the railway. Now, however, the survey for the Trans-Provincial Highway crosses the property. There are about 4½ miles more of this road to be built to reach the *Velvet-Portland*. The completion of this link will enable the owners to ship ore by motor-truck to Rossland; thence by railway to the Trail smelter, thus materially reducing transportation charges. Mining operations also will be greatly facilitated by the opening-up of the road.

Trail Smelter.

The shipping-list for the year shows that ore received for treatment at this plant amounts to approximately 400,000 tons. The bulk of this comes from the company's mines, notably the *Sullivan* at Kimberley. The balance is distributed among sixty-three independent shippers, of which forty-seven are operating in the Eastern Mineral Survey District. The continuous operation of this great metallurgical plant, with a record production of both zinc and lead, has been a bright spot in the history of the metalliferous mining of the district for the year. It is especially remarkable in view of the severe decline in metal prices, which caused stagnation in many of the large mining camps of the United States and the closing-down of numerous metallurgical plants.

This record was achieved by the economic mining of an immense tonnage at the *Sullivan* mine and the successful application of most up-to-date metallurgical practice. A few years ago it would not have been possible, for then the cost of producing 1 lb. of zinc exceeded the present market value of the metal; so, needless to say, great strides have been made in the recovery and separation of lead and zinc from the complex ores of the *Sullivan* mine. In this connection selective flotation has been a very important factor. The result of the season's work cannot help but reflect credit on the management, for such an achievement means good organization and general efficiency of the staff.

In September the Consolidated Mining and Smelting Company issued an amendment to its schedule of smelting rates, the essence of which is as follows: Under the existing Schedule C the quantity of silver and lead to be paid for was diminished by a sliding scale for ores carrying 10 per cent. zinc and over. This has been abolished. The amount of exchange allowed for the net value of gold and silver paid for will be that in excess of 3 per cent. instead of 5 per cent. as previously. The price for lead to be used in settlement will be the London Metal Exchange spot quotation for soft Spanish lead. The treatment rates as in Schedule C are unchanged, except the charge for zinc will be 50 cents per unit instead of 60 cents. Payment in full will be made in ninety days after date of arrival. Drafts will be accepted for all or part of the value, which doubtless could be negotiated without trouble at any bank. Interest during this period will be borne by the shipper.

The circular issued by the company goes on to say: "The price of lead is low on account of the large quantities in keen competition in the Orient. The Canadian market is taking only a small quantity. The intention is to vary the lead payment from time to time to suit conditions. Stocks are very large at present, which, added to the poor market conditions, makes it necessary to defer payments. We hope to be able to reduce the time of payments as conditions become better."

Since this circular was issued the company has notified the shippers that owing to the satisfactory reduction of surplus stock, beginning with January 1st, 1922, it will make payments as soon as possible after sampling; in other words, pay spot cash.

REVELSTOKE, TROUT LAKE, LARDEAU, AND ARROW LAKE MINING DIVISIONS.

Generally speaking, mining activities in these Divisions have been principally confined to leasing and prospecting, no operations on a large scale having been carried on. During the summer months things were unusually quiet, but latterly there seems to be a more optimistic feeling prevailing in the different mining centres, which would indicate that we can look for an improvement in conditions next year.

REVELSTOKE MINING DIVISION.

The activities during the season may be summarized as follows: A few men were employed at the *Lanark* mine during the summer months. At the *Waverly-Tangier* group several men

were employed at the mine and a crew of nine men on road-repair work. D. Woolsey did some prospecting on a deposit of amphibole asbestos near the main line of the C.P.R. in the vicinity of Illecillewaet. In the Big Bend district lode mining and prospecting generally has been inactive, although gold placer mining has been continued in the neighbourhood of Goldstream and French creeks by Alec. McRae, Remillard, J. C. Montgomery, and a few other old timers. Gus Lund and his partner spent part of the season prospecting their claims near Goldstream.

Big Bend District.

This area lies immediately north of Revelstoke and is bounded, as the name implies, by the Big Bend of the Columbia river. A trip was made into this country during the early part of September, but unusually wet and stormy weather greatly interfered with prearranged plans and limited the amount of useful work that could otherwise have been accomplished. The early history of the district relates that placer-mining was actively carried on in the sixties, when many of the tributary creeks of the Columbia river were prospected and some of the river-benches worked. In these times a thriving mining camp existed at Goldstream, steamboats plied up the river as far as the mouth of Downie creek, and never a day passed during the season that there was not a long pack-train on the trail taking in supplies from Revelstoke.

Now there is little to remind one of these good old days, as nearly all the old landmarks have become entirely obliterated, and if it were not for a handful of old-timers who persistently work at their diggings year after year the existence of gold placer deposits of the upper Columbia river would soon be forgotten.

It was many years after the first placer excitement died down that the attention of mining men turned to the possibilities of lode-mining, and a number of claims were staked at no great distance back from the Columbia. Silver-lead and copper deposits were discovered, demonstrating that there was a mineralized zone at a distance of from 6 to 10 miles back, while beyond this there still remains an immense area yet to be explored.

Transportation.—One often hears the question, "If ore is developed in this country, how can you get it out?" While admitting that transportation facilities are not all that could be desired, there are two features worthy of mention. One is that the Columbia river is easily navigable from the mouth of Downie creek to 19-Mile, at which latter point connection can be made with a wagon-road to Revelstoke, and the other is that the lateral valley of Downie creek affords a low-grade pass penetrating far into the heart of the Big Bend area, thus offering transportation possibilities for any properties located in the vast country surrounding this creek and its branches.

Topographical Features.—The area contains some very rugged and difficult country, typical of the northern section of the Selkirk mountain system. The creek-valleys and lower hillsides are heavily timbered with cedar, spruce, balsam, and hemlock, while ferns and devil's-club grow in almost tropical profusion in the low-lying swampy places. The valley of the Columbia between Revelstoke and Downie creek is narrow. The hill-slopes to the east are uniform and rise almost from the banks of the river, except in a few spots where there are low-lying bench lands of limited area. In such places farming has been attempted in the past, but owing to difficulties of marketing the produce these cultivated areas, with few exceptions, have been abandoned.

A panoramic view of the summits from near Downie creek presents a sea of high peaks and ridges dotted here and there with white patches of snow and ice, in contrast to which the occasional grass-covered slopes of the glacial basins stand out in pleasant relief.

Geology.—As the trail leads through evergreen forests for most of the way, only glimpses here and there could be obtained of the rock formations, and it is not until the summits are reached that an idea of the outstanding geological features can be formed.

The impressions gained were as follows: From Revelstoke to LaForme creek, the formation principally consists of granite cut by pegmatite dykes; in places there are large inclusions of schistose rocks. Beyond this, as far as Downie creek, greenish-grey schists, having a north-west strike, with thinly bedded bands of crystalline limestone, predominate. This series has been invaded by both basic and aplitic dykes, the latter variety predominating, originating from the near-by batholith.

A number of claims staked many years ago in this schist-belt have had varying amounts of development-work done on them, but there are no records of any ore having been shipped and they are all now lying dormant. They include the *Mastodon* group, a silver-lead-zinc property near the head of LaForme creek; the *J.L.* group, on Carnes creek, a silver-lead-zinc property;

the *Roseberry* on Carnes creek, a gold property; the *Standard* group at the head of 5-Mile creek, a copper property; the *Montgomery* group on Downie creek, a copper property; and others.

Type of Deposits.—The ore-deposits in this schist-belt occur as replacement deposits along sheared zones and represent mineralized bands conforming to the dip and strike of the formation.

From experience in the field and from personal observations, the writer would consider that this belt offers better possibilities for gold and copper deposits than it does for silver lead. The largest silver-lead deposits in the West Kootenay are invariably associated with carbonaceous slates and limestones. In the Big Bend district the northerly extension of these rocks probably continues farther back from the river, but the country, being an extremely difficult one to prospect, has been neglected.

Montgomery Group.

This property, comprising a group of ten claims, is situated at the head of Canyon creek, which flows into Downie creek at a point 9 miles from its confluence with the Columbia river. In a direct line it is about 2 miles or less from Downie creek and about 4 miles by trail. The distance from Revelstoke is about 55 miles.

Topography.—The claims are located on a steep and narrow ridge of Downie mountain, on either side of which deep canyons have been cut by glacier-fed creeks. The country is rugged in the extreme; the steep slopes are scored and laid bare in many places by the action of snowslides. The elevation at the point where the mine trail leaves Downie Creek valley is 2,000 feet, and that at the end of this trail, where most of the work has been done, is 5,500 feet.

Geology.—The geology of this area is particularly interesting, for erosion has revealed an almost vertical section of formation for nearly 3,000 feet. From this it can be seen that the base of Downie mountain is composed of a large mass of granite, overlying which there is a series of highly metamorphosed rocks consisting of dark schists. Near the summit the rocks are of lighter colour, probably consisting of greenish-grey schists; in these there are several bands of limestone which form a distinct geological horizon. Near the granite-contact the metamorphism is more pronounced and the formation, which is contorted and foliated, has been invaded by numerous aplitic dykes. The general tendency of these has been to conform with the schistosity of the rocks, and as they form narrow bands of highly siliceous material, they might easily be mistaken by the inexperienced prospector for quartzite or even quartz veins. The schists and limestone represent a thickness of from 300 to 500 feet, striking to the north-west and dipping to the north-east with marked regularity.

Ore Occurrences.—The ore occurs in mineralized bands, conforming to the dip and strike of the formation, possibly along the contact of a thin band of limestone and schist; the former having been replaced by mineral-bearing solutions. Although these bands exhibit continuity, the ore occurs in lenses where structural conditions have been favourable for deposition.

There are said to be five veins exposed between Canyon creek and the summit of the ridge some 3,000 feet above, along which there are exceptionally strong showings in bluffs and precipitous canyons swept by snowslides. Unfortunately weather conditions precluded an examination being made at higher altitudes. Such exposures only serve to show the extent and character of the mineralization, but as individual deposits they might as well be non-existent, owing to adverse climatic conditions and inaccessibility.

Workings.—The principal working is situated at the end of the trail at an elevation of about 5,500 feet. It consists of an open-cut about 100 feet long, exposing a width of 10 feet of ore along the dip of the vein, which strikes N. 55° W. and dips at an angle of 25° to the north-east.

The whole face is heavily stained with iron oxide. Upon breaking off samples at random, visual inspection showed that the bulk of the vein-matter consisted of massive pyrrhotite slightly discoloured in patches with chalcopyrite. In a few places where transverse shearing had produced fractures there has been a concentration of chalcopyrite associated with a quartz gangue. A sample of chippings taken at random along the face of the open-cut gave the following returns: Gold, trace; silver, 0.6 oz.; copper, 4 per cent. The bulk of the ore is so massive and hard that it is practically impossible to break off a representative sample with a moyle and prospecting-pick; hence the only satisfactory method would be to blast off large samples and quarter them down.

Another working about 300 feet higher up the hill on the same vein shows a width of about 15 feet for a length of 50 feet. Here the ore is more broken and mixed with country-rock. In

the opinion of the writer, a representative sample would not carry more than 2 per cent. copper. The above work was done by the Granby Consolidated Mining and Smelting Company in 1917.

In conclusion, the surface showings are strong, the copper tenor of the ore is low, and whether a sufficient tonnage exists to constitute an ore-body of commercial importance yet remains to be proved by further work.

On the return journey from the above-mentioned property, an early start was made from McIntosh's cabin for Keystone mountain by taking the old trail which leaves the Big Bend trail at a point 40 miles from Revelstoke. The summit was reached after four hours' steady climbing and camp was made for the night in an old dilapidated cabin on the *Carbonate Chief* claim. On this property a good deal of prospecting-work had been done many years ago in an endeavour to exploit a few quartz-croppings, but nothing of importance had been disclosed. A sample of some of the most likely-looking quartz ran: Gold, trace; silver, 1.4 oz. The elevation at the cabin is 6,400 feet.

The next morning the weather was very cold and uncertain, so instead of examining the various claims on the northerly end of Keystone mountain, as was intended, it was decided to make for the *Standard* mine before a possible snowfall might prevent the trip. After travelling from early morning over the beautiful park-like country of the summits, the *Standard* was reached shortly before dark. The rounded summits and ridges, together with the broken and crushed schists underlying the surface soil, give ample evidence that this picturesque summit was at one time the resting-place of an immense glacier.

Standard Group.

This property, comprising ten Crown-granted claims and eight fractions, is located at a distance of about 15 miles by trail from the Columbia river and thence about 35 miles to Revelstoke. The camp buildings, situated at an elevation of 6,500 feet, consist of two cabins. The accommodation at one time was sufficient for ten or twelve men, but the buildings are now in a state of dilapidation. The camp-site is nearly a mile from the workings. The property was extensively developed some fifteen or twenty years ago, since which time it has been abandoned, and in 1917 was sold for taxes to R. Abernethy, of Marpole, B.C., who is the present owner.

The principal workings are situated on the easterly slope of a narrow ridge which forms the divide between two small branches of the South fork of Downie creek. On the westerly side of this ridge the strata, dipping at an angle of 25° to the north-east and striking to the north-west, are freely exposed in a series of rugged bluffs. On the easterly side of the ridge glacial action has scooped out an extensive basin-like depression, leaving a fairly gradual slope to a point some 500 feet below the summit. Along and near the summit of this ridge there are indications of mineralization and a number of pits and open-cuts show that early prospecting had been quite extensive.

The formation consists principally of greenish-grey schists, with occasional thin beds of highly metamorphosed limestone. In the vicinity of the workings the following order of stratification was noted: Greenish-grey schists, a thin bed of limestone overlying a black schist, which latter had been subjected to much movement, as evidenced by numerous slickensided surfaces. The ore, consisting principally of chalcopyrite, was evidently deposited along the contact of these black schists with the limestone. The limestone has been eroded away and the workings are in the black schists, in which the ore was found to occur in lenses within the foliations of the schist. It also probably replaced the limestone along the contact.

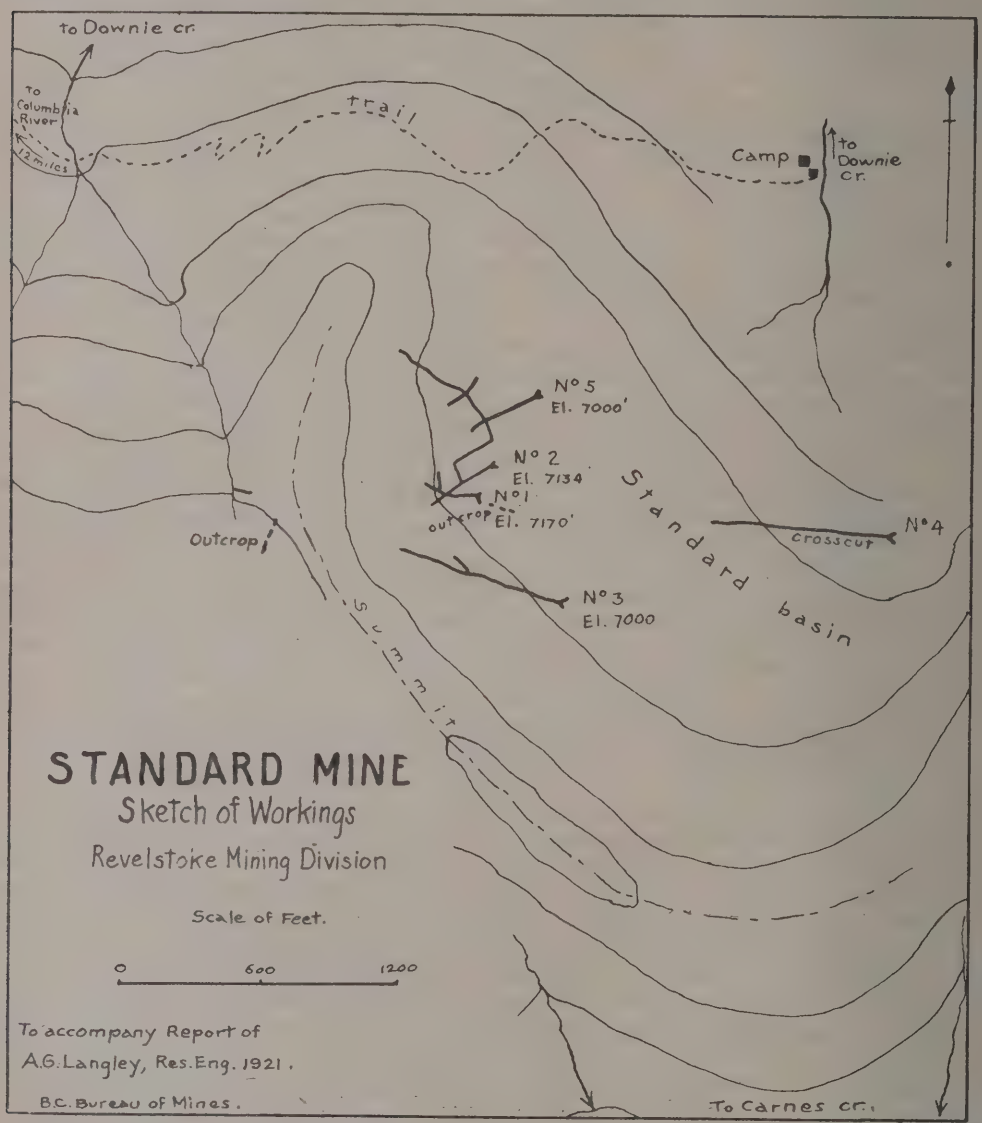
The ore-zone as developed constitutes a mineralized band conforming to the dip and strike of the formation and has been approached by three crosscut tunnels, which develop the vein to a vertical depth of 170 feet below the uppermost underground working. Unfortunately the various underground workings could not be examined, as they were either caved or full of ice and water.

A careful inspection of the dumps showed them to consist principally of crushed and slickensided black schists. No ore of any appreciable amount was noticed. According to a reliable assay plan in possession of the writer, the average values ran between 3 and 4 per cent. copper, with negligible values in gold and silver. Two other long crosscuts which had been driven were poorly located and did not develop ore.

It is roughly estimated by the amount of work done that the total expenditure on this property must have been at least $50,000 or $60,000. No doubt a lot of the money was thrown

away through lack of good judgment in planning the development-work. For further reference *see* the Minister of Mines' report for 1905.

One of the most interesting geological features of this area was the presence of a large mass of serpentine, which outcropped near the easterly side of the basin. Upon investigation it was found to contain numerous stringers of chrysotile asbestos of inferior grade, but which might improve in quality at depth.



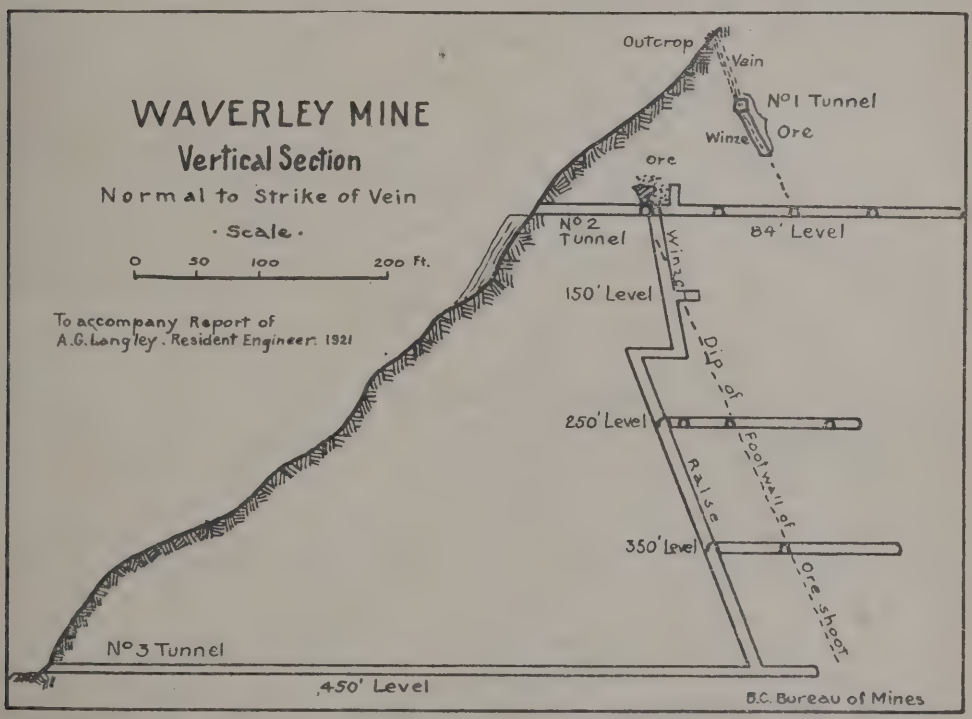
Waverly-Tangier Group.*

This property, situated at the head of the North fork of Downie creek, about 1½ miles below the summit flats separating that creek from the North fork of the Illecillewaet river, was acquired in 1918 by the Waverly Mines Company, of Spokane (F. M. Martin, president; G. H. Walters, secretary). Although the property is tributary to Downie creek, which flows into the Columbia river 46 miles above Revelstoke, the present route is by an old wagon-road about 28 miles in length (estimated), following the North fork of the Illecillewaet river from Albert Canyon, on the main line of the Canadian Pacific Railway 21 miles east of Revelstoke.

The old underground workings, which are quite extensive, date back to 1897 and 1898, when the property was being operated by the Gold Fields of British Columbia, an English company. The mines were closed down in 1899 and were idle until 1918, when the present company took them over. Since then a small crew varying from two to six men has been engaged on development during the summer months, putting in an occasional winter. Work done from 1918 to 1921 includes some 200 feet of tunnelling. The property comprises two separate groups, the *Waverly* and *Tangier*, of which the former is the most important.

The formation of the area consists of conformable beds of siliceous and argillaceous limestones, slates, quartzites, and schists, which have a north-west and south-east strike, dipping to the north-east. Both the *Waverly* and *Tangier* deposits occur in limestone.

Waverly.* This group consists of the *Waverly* and *Montague* (both Crown-granted), *Summit Lode*, *Mountain Goat*, *Montague Fraction*, and *Waverly Fraction* claims, which extend along and cover the steep mountain-side on the northern side of the creek from an elevation of 5,600 to 7,200 feet above sea-level. The vein, which conforms to the bedding of the country-rock, can be traced by open-cuts and stripping for over 2,000 feet along the outcrop, showing marked persistence in strike and dip (strike N. 40° W.; dip 60° to 65° to N. 50° E.). The width of the vein on the surface varies from 18 inches to 4 feet.



The ore is chiefly carbonates with small amounts of galena, the gangue consisting of altered country-rock, decomposed calcite, and quartz. The average silver content of the ore indicated by the few samples taken by the writer would appear to lie between 30 and 50 oz. to the ton, the lead content varying from a trace to 18 per cent. The gold values, generally speaking, appear to be negligible. Some of the ore shows copper-stains, indicating a small percentage of the metal. There is undoubtedly a very considerable tonnage of oxidized silver-lead ore available.

The underground workings, which in the aggregate will amount to about 3,000 lineal feet, mostly crosscut and develop one big ore-shoot. In the case of this shoot, which lies on the foot-wall side of the vein, replacement of the limestone walls has occurred on an extensive scale.

The examination was necessarily confined to the surface showings, No. 1 and No. 2 tunnels, as the workings below No. 2 tunnel were inaccessible owing to a cave near the portal of No. 3 tunnel and the bad condition of the timbers in the winze below No. 2 tunnel (the lower workings have since been made accessible). Practically all the development was done on the *Waverly* and *Montague* claims, principally on the former.

Commencing at the surface and proceeding downwards, the workings are briefly as follows:—

On the *Montague* claim, at an elevation of about 6,200 feet, a short crosscut encountered the vein at a distance of 20 feet and a winze was sunk 17 feet on carbonates containing streaks of galena. A sample across 4 feet near the bottom of the winze gave: Gold, 0.04 oz.; silver, 8 oz.; lead, 11 per cent. About 350 feet south-easterly along the outcrop a sample across 18 inches in a shallow cut gave: Gold, 0.02 oz.; silver, 14.4 oz.; lead, 14.9 per cent.

On the *Waverly* claim, about 750 feet south-easterly from the above crosscut and at about the same elevation, No. 1 tunnel was driven 90 feet on the vein just below its apex. In this tunnel the width of the vein varies from 14 inches to 2 feet. Near the portal of the tunnel a winze was sunk on the vein to a depth of 45 feet, the lower portion of which was caved and inaccessible. A sample across 2 feet at the top of the winze gave: Gold, 0.06 oz.; silver, 39.02 oz.; lead, 17 per cent.

About 300 feet south-easterly from and 84 feet vertically below No. 1 tunnel, No. 2 tunnel is a crosscut 330 feet in length. At 85 feet in from the portal the foot-wall of the ore-body was reached and drifted on for 85 feet north-westerly and 50 feet south-easterly. The 85-foot drift breaks through to the surface. Above the intersection of the crosscut and the two drifts a small stope was started. A sample across a width of 10 feet in the stope gave: Gold, 0.24 oz.; silver, 77.2 oz.; lead, 18 per cent.

The crosscut, passing through the ore-body, was then continued 245 feet farther. As the ore passes by insensible gradations into barren limestone, the width of what may constitute "ore" can only be determined by extensive sampling, having in view the grade of material which can be economically milled. The total width of the mineralized zone cut by the main tunnel is approximately 66 feet, including a horse of barren limestone of undetermined width, but which for sampling purposes was assumed to be 16 feet wide. The mineralization is strongest on the foot-wall side of the zone, as shown by the above-mentioned sample taken in the stope.

Samples along the crosscut gave as follows: Across 34 feet, including the good ore on the foot-wall side: Gold, 0.02 oz.; silver, 16 oz.; lead, 2.5 per cent. The 16-foot limestone horse was then omitted and a sample across 16 feet on the hanging-wall side of the zone gave: Gold, trace; silver, 2.4 oz.; lead, 0.2 per cent. Little importance can be attached to these results, however, mill tests being required to give reliable information on the values to be expected.

The hanging-wall of the ore-zone, which is marked by a seam of calcite, was drifted on south-easterly for a distance of about 70 feet. The hanging-wall seam was not drifted on in the opposite direction, but a little farther along the crosscut a semicircular tunnel driven north-westerly is in country-rock for the most part, but breaks into the hanging-wall of the ore-zone near the face. As a short crosscut tunnel had been run off the drift at this point, it was possible to get a sample across a 16-foot section, which gave: Gold, trace; silver, 2.8 oz.; lead, 1 per cent.

Farther along the main crosscut another tunnel, driven 60 feet north-westerly along a seam of calcite, is in country-rock. Several short tunnels and a 26-foot raise off the main crosscut in the ore-zone show strong mineralization, a grab sample from several hundred tons of material stored in these places giving: Gold, 0.14 oz.; silver, 36.8 oz.; lead, 15.5 per cent.

On the first south-easterly drift above mentioned, which follows the foot-wall of the ore-body, a winze was sunk 110 feet, at which point an offset was made to connect with a raise 260 feet up from No. 3 tunnel.

The vertical depth between No. 2 and No. 3 tunnels is 350 feet, and three intermediate levels have been turned off from the big winze and raise, named the 150-foot, 250-foot, and 350-foot levels, which means that they are respectively that distance vertically below No. 1 tunnel. As, for reasons stated above, all the workings below No. 2 tunnel were inaccessible, the information relating to them has been taken from the old company's maps and records, which show that the ore-body was encountered and developed on all three intermediate levels, with good results as to width, length, and values.

No. 3 tunnel, 450 feet vertically below No. 1 tunnel, is a crosscut about 635 feet long (by scale), which apparently was discontinued a short distance from the expected intersection with the vein.

Tangier.* This group consists of the *Tangier* (Crown-granted), *Tiger*, *Silver Tip*, and *Black Bear* claims, which are located along the bank of the creek immediately below and south of the *Waverly* group, at an elevation of 4,800 feet (collar of shaft). Outcropping along the creek-bed there is a well-defined fissure-vein with a similar strike and dip to the *Waverly* vein, also conforming to the bedding of the country-rock, which can be traced by open-cuts and stripping for over 1,000 feet along the surface. This vein, which varies in width from 1½ to 5 feet, contains in places small bunches and stringers of galena and zinc-blende, with streaks of grey-copper. The gangue is quartz, calcite, and limestone. The shaft was sunk on an ore-shoot lying on the foot-wall side of the vein at some little distance from it. The vein itself does not seem to have been reached by the underground workings.

The development on the *Tangier* consists of 110 feet of double-compartment shaft, 829 feet of tunnelling, and a 100-foot winze. The shaft is situated on the *Tangier* claim a short distance south-easterly from and a little above the creek. The ore developed in the workings is of the replacement type, probably connected with the above-described vein.

The ore piled on the dump, amounting to several hundred tons, consists of galena, zinc-blende, pyrite, with small amounts of grey-copper in a gangue of quartz, calcite, and limestone. A grab sample from this large pile of ore gave: Gold, 0.06 oz.; silver, 16 oz.; lead, 8.5 per cent.; zinc, 5 per cent. A picked specimen of pyrite and quartz from the same pile gave: Gold, 5.6 oz.; silver, 8.2 oz.

The *Tangier* ore differs from that of the *Waverly*, in that there is generally less evidence of oxidation, and the *Tangier* ore contains appreciable gold values in association with pyrite. There is a separate pile (roughly estimated at 200 tons) near the shaft-dump of black decomposed ore which apparently came from the winze below the 100-foot level. A grab sample of this material gave: Gold, 0.24 oz.; silver, 21.2 oz.; lead, 8.5 per cent.; zinc, 15 per cent. The workings are briefly as follows: A vertical double-compartment shaft was sunk for a depth of 100 feet. A small surface tunnel north of the shaft was run in and encountered ore, connection being made with the shaft at the 20-foot level. Records show a small stope was started from this 20-foot level and continued to the surface, the ore being stored in a pile below the shaft-dump. At the time of the examination the shaft connection was full of ice and the portal of the adit was caved, so this level could not be inspected.

At the 100-foot level drifts were run north-westerly and south-easterly, encountering two mineralized zones, one on each side of the shaft. The ore-shoot in the south-east drift, having the strongest showing, was prospected by a 100-foot vertical winze. At the time of the examination this was partly filled with water. A grab sample from a small pile of black decomposed material around the collar of the winze gave: Gold, 0.16 oz.; silver, 35.6 oz.; lead, 11 per cent.; zinc, 3 per cent.

This ore-shoot in the south-east drift on the 100-foot level has an apparent length of 40 feet and a width of from 4 to 6 feet. A sample across 6 feet in the face of the drift gave: Gold, 0.1 oz.; silver, 3.7 oz.; lead, trace; zinc, 1 per cent.

The ore-shoot in the north-westerly drift shows little mineralization, a sample across 4 feet giving: Gold, trace; silver, 0.8 oz.; lead, *nil;* zinc, 2.5 per cent.

In addition to the above workings, several hundred feet of tunnels have been run in barren limestone, in which there are numerous open fissures and calcite-seams.

At present transportation to the *Waverly-Tangier* property offers a serious problem, as the old wagon-road, long disused, is in such a bad state that practically a new road would have to be constructed throughout. The problem of deciding on a route to the property will require very careful consideration.

Asbestos.—Inquiries made last year for asbestos by Japanese representatives aroused interest among the prospectors and samples were brought in from far and wide. With the exception of some chrysotile, they were all of the amphibole variety, which has no commercial value.

The chrysotile asbestos was discovered many years ago by R. Armstrong on the westerly slope of Mount Sproat, near Arrowhead. It did not, however, attract much attention, for it was thought to be of inferior grade and very little prospecting-work was attempted.

This year J. T. Lauthers joined forces with R. Armstrong, and further prospecting was done, with encouraging results, although the work accomplished was very limited owing to lack of capital. The following is a brief description of the property:—

Asbestos Group. This group comprises four claims and is situated at a distance of 3 miles from the town of Arrowhead, in the Lardeau Mining Division. It is owned by J. T. Lauthers, of Revelstoke, and R. Armstrong, of Sidmouth. In a direct line the claims are within 2 miles of the branch line of the Canadian Pacific Railway running between Revelstoke and Arrowhead. The elevation of the deposit is 4,200 feet above sea-level, or 2,800 feet above the Canadian Pacific Railway track.

At this altitude there is a belt of serpentine rocks, which are described by M. F. Bancroft, of the Geological Survey, as follows: "The serpentine has been formed through the alteration of a basic igneous rock, intruded as a dyke or stock into a sedimentary series of quartzites, crystalline limestones, and metargillites. The serpentine-belt, crossing the hillside, attains a width of about 1,000 feet and forms bluffs for half a mile or more paralleling the Columbia river."

The surface of the hillside is mostly covered with overburden and has only been prospected by a few pits and open-cuts over a small area, but wherever work has been done it has exposed asbestos-bearing serpentine. The asbestos occurs filling small veinlets in the serpentine as cross-fibre, with widths varying from ¼ to ¾ inches. It also occurs as "slip-fibre," having a length of 3 inches.

The short-fibre asbestos is harsh and brittle and lacks the tensile strength necessary for spinning purposes; it should, however, make a good filler for textiles. In the opinion of Dr. R. A. A. Johnston, of the Geological Survey, it is as good if not superior to much of the South African stock which is coming on to the market in apparently increasing amounts to be used as a filler. The best grade so far found is pronounced to be worth possibly about $400 per ton.

As already stated, very little work has been done; the results obtained so far are encouraging, but more capital will have to be expended on further development in order to determine the extent and prevailing quality of the asbestos.

Wigwam Group.* An examination of this property was made following an application for assistance towards the cost of making repairs to the trail leading to it.

The group, consisting of the *Wigwam No. 1*, *No. 2*, *No. 3*, and *No. 4* claims, owned by R. Armstrong and J. Kirkpatrick, of Arrowhead, is situated on the northern side of Isaac creek, about 7 miles by trail and road from Wigwam, on the Canadian Pacific Railway south of Revelstoke.

The old workings are about 1,000 feet (estimated) above the creek. The ore is low-grade lead-zinc, occurring as a replacement deposit in limestone. The associated minerals are galena, zinc-blende, pyrite, and pyrrhotite in a limestone gangue.

The ledge, which dips flatly into the mountain in conformation with the enclosing strata, appears to be from 50 to 60 feet in width. Outcroppings of ore can be found at intervals for several thousand feet along the strike on the surface. Between the outcroppings of ore the soil is discoloured and reddish from the oxidation of the sulphides.

The old workings consist of some open-cuts across the width of the ledge. Grab samples of broken ore in three of these open-cuts assayed as follows: Gold, *nil*, trace, trace; silver, *nil*, trace, trace; lead, trace, 11 per cent., 8 per cent.; zinc, 3 per cent., 11 per cent., 5 per cent. These results were disappointing, as former assays are said to have given as high as 10 oz. of silver to the ton.

Although the deposit has hardly been scratched as yet, it is obviously very extensive. If a demand for this type of ore should develop, and if a tonange of ore sufficient to warrant the erection of a concentrator should be blocked out, a good site for a concentrator could be obtained on the creek below the claims. Timber for mining purposes is plentiful.

TROUT LAKE MINING DIVISION.

The following is a brief summary of the activities in this Division:—

At the *True Fissure* a crew of about five men will be employed during the winter at extending the lower or C tunnel some 300 or 400 feet.

Recent work by Andy Craig and Alex. McLean at the *Noble Five*, situated at the head of Brown creek, uncovered a nice showing of ore 18 inches wide in the bottom of the upper tunnel. A sample taken across 2 feet of vein-matter ran: Gold, 0.40 oz.; silver, 75.6 oz.; lead, 16 per cent.; zinc, 24 per cent.

M. Leahy, who has been in charge of the development-work at the *Crescent* and *Horn Lead* properties, reports that satisfactory results have been obtained.

S. Faulk and S. White, who have been leasing at the *Nettie L.* shipped 18 tons of silver-lead ore to Trail.

At the *Silver Cup* S. Cavanaugh was working under a lease during the season. A small shoot of ore was encountered not far from the portal of the 700-foot level, from which he expected to make a shipment of 15 or 20 tons. A grab sample from a small pile of sorted ore ran as follows: Gold, 0.16 oz.; silver, 146.4 oz. to the ton; lead, 54 per cent.; zinc, 1.6 per cent. The property was visited by the writer, but in view of the condition of the workings, the limited amount of time at his disposal, and the lack of facilities in the nature of mine-maps and records of shipments made, no report will be attempted on this occasion; more especially as the property has already been reported on, which reports may be seen in the Annual Reports of the Minister of Mines for 1914, 1903, and 1904. From these reports it will be seen that the mill erected to treat the ore was unsuitable. In this connection it must be remembered that it was designed and installed before the oil-flotation process had been successfully introduced as an economical method for the separation and recovery of metals.

J. W. Livingston continued development-work at the *Gold Bug*, on the South fork of Lardeau creek, and had a small tonnage of clean galena ready for shipment.

At the *Parsboro*, which is situated across the creek from the last-mentioned property, a tunnel 180 feet in length has been driven to gain depth on a showing of ore in an old shaft. Work was discontinued before the tunnel had gained its objective.

Mrs. Jowett, as usual, spent part of the summer prospecting at the *Foggy Day* and at other properties in which she is interested along the summit of Silver Cup mountain. At this property good gold values are obtainable; for instance, a sample of earthy oxidized material from an open-cut ran: Gold, 7.54 oz.; silver, 43.2 oz. to the ton.

J. H. Martin and associates purchased the *I.X.L.* and *J.I.C.* claims on Triune creek from C. T. Porter. Four or five men were employed during the season. The work consisted of driving a 100-foot tunnel, building a new cabin, and improving the trail. It is reported that there is a good showing of galena in the tunnel and that work will be resumed next spring.

Dan Savoy, an old-time placer-miner of the Trout Lake district, after some twenty-five years spent in the Klondike and Alaska, has returned to make tests of the gravels along Lardeau creek from the lake, with a view to forming a company to carry on placer-mining on a larger scale.

True Fissure.

This group, comprising eight Crown-granted claims and fractions, is owned by the True Fissure Mining and Milling Company, of Cincinnati, Ohio, of which Theo. W. Mitchell is secretary. The property is situated on the Great Northern mountain at a distance of about 3 miles from Ferguson, from where a good trail leads to the camp. The elevation of the workings ranges from 5,500 to 5,700 feet above sea-level. The topographical features in the vicinity of the workings afford a good camp-site, and it is a property that can be worked the year round without any danger or inconvenience from snowslides, which often accompanies operations at these altitudes.

The prospectors who discovered this property must have at first thought that they had one of the greatest bonanzas in the country, for erosion has cleaned off the hanging-wall of the vein, leaving highly mineralized material as a coating on the foot-wall, thus exposing a large area devoid of vegetation or any other covering. The vein is a strong quartz-filled fissure dipping at about 40° to the east and striking N. 20° W., it conforms to the stratification of the country-rock. The foot-wall is composed of light-coloured highly siliceous schist.

It was difficult to determine the exact nature of the hanging-wall on account of its highly altered state, but the impression was gained that it consisted of a siliceous lime-schist. In any event it would appear that the vein occupies a sheared zone which has been produced by movement along the bedding-planes. On the hillside above the large surface exposure no evidence of its continuation could be seen.

Numerous open-cuts and small workings have traced the continuity of mineralization for a horizontal distance of 1,500 feet or more, but the main concentration of ore seemed to have been

centralized around the large surface exposure and at the *Blue Bell* workings, which lie some 800 feet to the north.

The predominant ore exposed at and in the vicinity of the outcrop, and of which there is a considerable tonnage, was a fine-grained mixture of galena, zinc-blende, and iron pyrites. A sample of this ran: Gold, 0.06 oz.; silver, 18.5 oz.; lead, 27.2 per cent.; zinc, 30.7 per cent.

The principal underground workings consist of two tunnels driven along the hanging-wall of the vein. The upper or B tunnel gains a vertical depth of about 200 feet below the outcrop and has a total length of about 190 feet. From this main tunnel the vein has been exploited by short crosscuts at intervals of 50 feet. Its width varies from 3 to 9 feet. The mineralization, consisting of galena, zinc-blende, and iron pyrites associated with a quartz gangue, is irregular and inclined to be "bunchy," but it is satisfactory to note that both the width of the vein and concentration of ore-minerals improve as the end of the tunnel is approached. A sample moiled across a 44-inch width of the vein near the face gave the following results: Gold, 0.07 oz.; silver, 13.8 oz.; lead, 12.4 per cent.; zinc, 21.2 per cent.

The lower or C tunnel, driven from the bottom of the basin, gains an additional depth of about 80 feet; this is the maximum depth obtainable without driving tunnels of great length, which the present stage of development does not justify. The total length of C tunnel is about 438 feet. The vein was encountered at a distance of about 200 feet from the portal; the direction was then changed and for its last 150 feet the tunnel runs parallel to the strike of the vein in the hanging-wall. No crosscutting to prove the vein had been done in this length; hence no ore of importance had been developed from this level. It is proposed to extend this tunnel 300 or 400 feet to develop the vein below strong surface exposures to the south-east of the eroded portion. A small crew of men is now engaged in this work.

The appended sketch, made from a hurried Brunton survey, is only intended to give an idea of the "lay-out" of the principal workings and is not accurate in detail.

The *Blue Bell* workings are located on the northerly extension of the vein, at a distance of about 800 feet from the large surface exposure. A crosscut tunnel driven in a westerly direction into the face of a small bluff struck the vein at 150 feet. Here the vein shows a strong width of quartz, in which the pay-streak varies from a few inches to 3 feet in thickness. About 150 feet of drifting has been done, above which the ore has been stoped.

In order to gain depth a crosscut was started at the bottom of the bluff, 132 feet lower down. This has been driven for 150 feet. From near its portal another tunnel has been driven for a distance of 210 feet in a north-westerly direction, following a small stringer which was thought to be the vein. Although time did not allow of a survey being made, in the writer's opinion it was doubtful if this latter tunnel was on the vein. A further endeavour to develop the vein at depth should be made, as a considerable tonnage of very nice silver-lead ore was extracted from the upper level.

The shipments made by the company during 1908 and 1909 make up a total of between 200 and 300 tons, of which the average would run about as follows: Gold, 0.10 oz.; silver, 74 oz.; lead, 24 per cent.; zinc, 10 per cent. The future of this property as a large producer would seemingly depend upon the results obtained by the continuation of the C tunnel.

Arrow Lake Mining Division.

In this Division the *Millie Mack* mine near Burton was operated by the owner, H. E. Forster. Three men were employed. About 12 tons of high-grade silver-lead ore was extracted and shipped.

It is reported that the *Mountain Chief* mine at Renata has reverted to the original owners, who have commenced work on the property.

NORTH-EAST KOOTENAY DISTRICT.

GOLDEN MINING DIVISION.

REPORT BY G. E. SANBORN, GOLD COMMISSIONER.

I have the honour to submit herewith the annual report on the Golden Mining Division of the North-east Kootenay District.

I regret that so little has been done in mining in this district during the year 1921. No shipments of ore have been made.

Some considerable interest in mining has been evidenced in different parts of the district. Development-work has been done on mica claims in the Kinbasket Lake region, and an interest in the *Rustler* claim at End creek, in the Big Bend, has been acquired by Calgary people, who propose to develop it.

Information is at hand that after investigation an English syndicate has secured a group of claims in the International basin and work on them will be proceeded with as soon as weather conditions will allow.

Interest is also manifested in placer-mining on Canyon creek. As it was late in the season when any claims were staked, not much was done, but it is expected that when the ice moves in the spring work will be resumed.

WINDERMERE MINING DIVISION.

REPORT BY E. M. SANDILANDS, MINING RECORDER.

I have the honour to submit my report for the Windermere Mining Division for the year ending December 31st, 1921.

I regret to say that mining in this Division, as well as, I presume, all over the Province, has been of a very desultory character during the past year, partly due to the low prices of metals and also to the excessive and unsatisfactory terms of freight and treatment.

Furthermore, capital was very shy in investing in mining under the above conditions; consequently very little prospecting was done, there being no incentive to discover anything new. However, towards the end of the year things were looking a little better and the prospects for 1922 brighter. In spite of the above, the mining receipts have only fallen off about 10 per cent. in this office, this being due to money paid in in lieu of assessment-work.

Paradise.—This property worked a small force of men during the past summer, mostly doing development-work. Towards fall more men were put on and shipments resumed. The low prices of metals and high freight and treatment charges caused this mine to hold the ore until better conditions prevailed.

Bunyan.—This property is owned by the Bunyan Barium Syndicate and is situated on the mountain to the rear of Invermere. The property during the summer worked an average of eight men, doing mostly development-work, and at the end of August last was closed. This company ran 300 feet of tunnel and 50 feet of raise. The ore goes high in barium, picked samples going as high as 96 per cent. The company is contemplating putting up a reduction plant for the treatment of this ore.

Maple Leaf and Silver King.—These properties are owned by the Toby Creek Mining Company and are situated on Jumbo fork, a tributary of Toby creek. During the summer a small amount of work was done and several tons of ore sacked, but owing to the low prices of metals and difficulties of getting the ore to the market the ore was not shipped. The work was under the management of W. L. Smith.

Isaac and Isaac No. 1.—Some work of a prospecting nature was done on this promising property, but no ore was shipped. W. D. McMillan, of Seattle, is now the owner, having recently completed the purchase from H. E. Forster.

Vermilion and Margaret.—These properties are owned and operated by the Zenith Mines, Limited, of Calgary. Several tons of ochre ore has been shipped from these claims. The ore is hauled over the Banff road to Castle, a siding on the Canadian Pacific Railway. I have no record of where it is shipped.

The *Outlook*, *Evening Star*, *White Star*, and *Silver Spray* groups have all had their annual assessment-work done, and on some more than the regular work was done. The work performed, I hear, gave encouraging results. These groups are all on Toby creek and tributaries.

SOUTH-EAST KOOTENAY DISTRICT.

FORT STEELE MINING DIVISION.

REPORT BY N. A. WALLINGER, GOLD COMMISSIONER.

I have the honour to submit a report on the progress of mining in the Fort Steele Mining Division for the year 1921.

In reviewing the mining conditions since my last report, a steady progress and improvement can be reported; more prospecting and development has been attempted, and in quartz-mining, particulalry with regard to free-milling ores, a much stronger interest is being shown.

Placer-mining has been general over all the gold-bearing creeks, the prospects in most of them being good, and all of them will be in full blast next spring. Returns from Wildhorse are increasing, but the camps on Weaver and Perry creeks and the Moyie river are only in prospecting stage.

The work of the Consolidated Mining and Smelting Company at the *Sullivan* is rapidly opening out, and a commencement on the site of the concentrator between Marysville and Kimberley has been made; a site for a power plant has also been selected and water applied for from Skookumchuck creek; this when completed will ensure an independent supply of electrical energy, the power-line being perhaps 15 miles long. The shipments from the *Sullivan* mine in 1921 are: Lead ore, 33 tons; zinc ore, 297,210 tons; iron pyrites, 1,121 tons. Improvements made during the year include five new cottages and one large bunk-house, the burnt building having been rebuilt.

At last it seems as though some attempt is to be made to ascertain the value of the free-milling gold-quartz properties on Perry creek. It is understood that a tunnel will be run this winter to tap the big vein on the Cranbrook Homestake Company's property at a 400-foot depth, and a 10-stamp mill complete with recovery-plates and cyanide-vats installed, should the results prove satisfactory. A deal on another group is pending; these two represent the typical ores on Perry creek, and the success of either will be a matter of much importance to the district.

On the West fork of Hellroaring creek a little development is being pushed on an old property, and on the successful results of this work a great deal depends, as a systematic plan of development would be inaugurated at once.

Work has been continued on the *Victor* group during the season, but no results have been ascertained; the camp has been closed down for the winter, but is to be reopened in the spring.

The Federal Mining and Smelting Company, which had taken a bond on the *Stemwinder* group, situated on Mark creek, between the *Sullivan* and the *North Star* groups, has stopped work, the results being disappointing; this group is the property of Mann & MacKenzie and has a large body of pyrrhotite, carrying galena and zinc-blende. A bond on a property on Copper creek, the *Brenda* group, has been completed and work is proceeding; the camp has been established and a shaft is now being sunk; the ore is a grey-copper in a quartz gangue, carrying good values in gold and silver.

There have been two locations of graphite made in widely separated districts, Matthew creek and Wildhorse creek, but until more work is done nothing can be said as to their value.

No further work on the *Rob Roy* group on Skookumchuck has been done where the native copper was struck, but it is understood that a new company is to carry on development to a greater depth.

REVELSTOKE AND LARDEAU MINING DIVISIONS.

REPORT BY ARTHUR JOHNSON, GOLD COMMISSIONER.

I have the honour to submit herewith a report on the mining conditions within the Revelstoke and Lardeau Mining Divisions for the year ending December 31st, 1921.

REVELSTOKE MINING DIVISION.

ALBERT CANYON CAMP.

The *Lanark* mine was in operation with a crew of men doing development-work during the spring months, but since June all work ceased and this property is now idle. It is the intention, however, of the management, we are informed, to commence with a full crew of men early next spring to continue development. No ore was shipped from this property during the year.

A crew of five men has been employed steadily during the year on the *Waverly-Tangier*. The men were chiefly engaged in clearing the old workings of the mine and development. Eight men were engaged for three or four months in clearing the wagon-road to this property.

The *Silver Creek* mines, situated on Silver creek, about 7 miles from Albert Canyon, were idle during the season, only assessment-work being undertaken.

BIG BEND DISTRICT.

Nothing of importance was undertaken in the way of the development of either the lode or placer properties in the district during the past year.

LARDEAU MINING DIVISION.

The Camborne camp was exceptionally quiet during the year. The *Multiplex* mines, of which O. T. Bibb is the manager, kept a small crew of men working on their properties doing development-work.

Charles Harvey and associates put in considerable development-work on their gold properties situate on Pool creek, a few miles above Camborne, with good results. It is the intention to proceed with work again when the season opens up next spring.

SLOCAN DISTRICT.

AINSWORTH MINING DIVISION.

Report by Ronald Hewat, Gold Commissioner.

I have the honour to submit herewith the annual report on mining operations in the Ainsworth Mining Division for the year ending December 31st, 1921.

Owing to the small demand for metals and the high costs of mining there has been very little mining development done in my district this year.

During the first three months of 1921 the *Bluebell* mine mined and treated 3,350 tons of ore from surface workings; but metal prices, the nature of the ore, semi-oxidized as it was, and high costs combined, rendered an operating margin impossible of attainment.

The Utica Mines, Limited, employed an average of four men, worked ninety-seven days, and shipped 45 tons of ore containing 5,402 oz. silver and 8 tons lead, but no new buildings or improvements were made, other than that of driving drifts and raises to facilitate the extraction of the ore.

On the *Kirby* group, owned by A. J. Curle *et al.*, and situated at Riondel, on Kootenay lake, a tunnel was driven from the lake-shore 290 feet in order to crosscut the lead, which the owners expect to pick up in another 100 feet. The surface exploration done during 1921 uncovered another well-defined vein conforming to the formation, apparently from 30 to 40 feet wide, about 80 feet farther up the hill than No. 1 lead, and in which there is a good showing of ore right at the surface, and in addition four other veins from 2 to 4 feet wide cutting the formation were also found, all of them showing pay-ore.

SLOCAN MINING DIVISION.

Report by Angus McInnes, Mining Recorder.

I have the honour to submit herewith my annual report on the Slocan Mining Division for the year ending December 31st, 1921.

I regret to have to say that there has been very little improvement in conditions over last year. We have not yet recovered from the effects of the disastrous strike of last year, together with the slump in the price of the metals we produce.

The only mines working this last year were the *Silversmith* at Sandon, the *Bosun* at New Denver, and the *McAllister* at Three Forks. The first-mentioned property has purchased the *Ivanhoe* mill and enlarged it to about double its former capacity; they have also built a tram-line from the mine to the mill and are now ready to operate on a large scale. The *Bosun* ships very high-grade ore in fairly large quantities. About thirty miners are employed.

The *McAllister* is only doing development-work for the winter. In the spring I understand they are going to erect a concentrator at Three Forks and run a tram up to the mine, about 4 miles. Besides the above, there are about thirty sets of leasers operating in the different mines around the camp; they are reported to be doing well.

SLOCAN CITY MINING DIVISION.

REPORT BY T. McNEISH, MINING RECORDER.

I have the honour to submit my report of mining conditions in the Slocan City Mining Division for the year 1921.

The effects of the strike are still being felt in the Slocan and very little has been done outside the usual assessment-work required. Very little new capital is coming in, but a few properties have been operating and have given very encouraging results.

I append herewith a memorandum of what properties have been working during the year.

The *Arlington* mine, which is under lease and bond to R. R. Hedley, is getting out some rich ore. There is an opening there for capital to put in a cyaniding plant, and there is sufficient power at hand to operate the mill.

The *Anna* group, owned by Kurt Zimmerman, is being worked by a small force of men which is getting out some rich ore in course of development. This property adjoins the *Ottawa* mine.

The *Little Tim* is owned by D. B. O'Neail and A. S. McAuley, who have been doing development-work and taking out some ore, and have a car nearly ready for shipment to the Trail smelter.

The *Ottawa* mine is under lease and bond to L. H. Biggar and associates, who have had their tube-mill in operation during the last year and have made a few shipments to Trail smelter. They have had considerable difficulties to overcome in the completion of their plant and in the securing of pebbles and lining, but now have a steel lining and are changing to steel balls instead of pebbles. What has been put through has shown a saving fulfilling all expectations of the lessees. Further development and ore-output will be done in the spring of 1922.

The *Black Prince* is under lease and bond to J. T. Tipping, who has made one shipment and has two more cars to come out in the spring.

The *Hampton* is under lease and bond to Wafer, Barber & Maurer, who have struck it rich and are taking out some high-grade ore, and with spring will be on the list of shippers. This mine was one of the early producers, but has been idle for a number of years. It is now, however, proving better than ever.

The *E. & R.* group, owned by Frank Benish and Joe Daniels, is being well developed. A new crosscut is being driven to tap the lead at depth, and it is believed that with the striking of the lead this will be a shipper, as some very high-grade ore has been found during development-work. The parent body has not yet been struck.

The *Tamarac*, under lease and bond to M. Cameron, has a fine showing of ore and will be shipping in the spring as soon as it is possible to get the ore out.

The *Lily B.*, owned by George Long and associates, is being worked by a small crew. It has several shoots of high-grade ore in sight and will be shipping in the spring.

The *Richmond* group, owned by F. Franz, who has been doing considerable development-work, has a large lead which, if it develops into a shoot, will be a large one. Considerable high-grade ore has been encountered in all the driving, but it has not been continuous.

The *Silver Crest* group has had considerable work done on it during the past year and will be developed on a larger scale in the spring.

TROUT LAKE MINING DIVISION.

Report by Oscar Jacobson, Mining Recorder.

I have the honour to submit herewith my report for the Trout Lake Mining Division for the year ending December 31st, 1921.

Owing to the general depression of business the mining industry did not come up to what was expected during the year; only two properties were worked (by leases) to get out ore—namely, the *Silver Cup* and the *Nettie L.*—and a small tonnage of ore was shipped from each of them.

Development-work was started early in the fall on the *True Fissure* property and will continue all winter. A very good strike of calcite was located on Lake creek and three claims located. The locators have great hopes of the find, as they expect a New York party to come in during next summer to look over the discovery.

The usual amount of assessment-work has been done during the year and new locations of claims have kept up with former years.

Placer-mining took a new lease of life during the summer; two dredging leases were granted by the Gold Commissioner and seven claims were recorded.

B. T. O'Grady, Assistant Engineer to A. G. Langley, of Revelstoke, came in during the later part of the fall to look over some properties, and will no doubt give his report on them.

NELSON DISTRICT.

NELSON MINING DIVISION.

REPORT BY J. CARTMEL, GOLD COMMISSIONER.

I have the honour to submit herewith the annual report on the Nelson Mining Division for the year ending December 31st, 1921.

Owing entirely to prevailing economic conditions, the year has been an exceedingly poor one from the mining standpoint so far as this particular Division is concerned, and while I consider it unwarranted at the present time to indulge in any optimistic speculations regarding the immediate future, it is only fair to mention that, judging by a number of inquiries received from the United States of America and England by local mining men for particulars as to gold-producing properties, it would appear that a certain amount of optimism is justified.

A considerable amount of development-work has been done, but shipments to the smelter were almost negligible, amounting to little over 100 tons.

Nugget.—The Nugget Gold Mining Company continued work on its properties, situated on Sheep creek, and for several months kept the *Motherlode* mill running steadily, with good results, I understand.

Granite-Poorman.—This well-known mine, which is one of the oldest producers in the district, was bonded early in the year, the present operators confining themselves strictly to a development policy, and much interest is centered on the outcome of the venture.

Reno Group.—The Reno Gold Mines, Limited, has organized with a capital of $1,000,000 and is pursuing a vigorous policy of development with the properties on Fawn creek, a tributary of Sheep creek. Reports point to its becoming a large gold-producing mine.

Bayonne Group.—I learn that a Spokane syndicate has bonded this property and, in addition, several other promising groups of claims in the same locality, and it looks as if this section of the district is at last coming into its own. From all reports there are many hundreds of thousands of dollars' worth of ore in sight.

Spokane Group.—No shipments were made from this property during the year, although the owners are said to have ore to the value of some $100,000 ready. Lack of transportation facilities appears to be the only reason for these valuable properties in the Bayonne section remaining quiescent, and it is hoped that some amelioration of this condition will be evident during the coming year.

Yankee Girl.—This mine has been idle all year since the 10th of December, 1920, at which time it was closed down. It is understood that negotiations are under way for reopening this property, which has produced over $500,000 up to date.

Dundee.—This mine, which adjoins the last named, is still idle, but I understand that there is some hope of English capital being interested in the property before long.

Mayflower. The Gibraltar Mining Company, with headquarters at Waverly, Wash., has been running a crosscut tunnel on this claim and has driven same about 225 feet toward a "showing" on the trail to the *Mayblossom* and *Free Silver* claims, which is said to lack about 20 feet of reaching its objective, the depth attained being about 125 feet at the present face. The property is situated about 1½ miles west of Ymir, on the Quartz Creek side of the divide between Boulder and Quartz creeks.

Goodenough Group. This property, adjoining the old *Ymir* group, has recently been further developed by means of a drift on the vein 300 feet lower than the collar of the two shafts, which latter are down about 40 to 50 feet each on parallel veins some 30 feet apart at the apex of the hill, where the only known showings were visible until this new tunnel was driven. The new tunnel has encountered the vein in-place at a point about 600 feet west of the shafts, and is said to be exceptionally strong

where recently shown up, being some 6 feet wide from wall to wall, with quartz about 2½ feet wide, plentifully mineralized; but I am not aware that any assays have been made since the vein was encountered, so I am unable to state whether or not commercial ore has yet been reached. The big ore-shoot of the adjacent *Ymir* mine, together with a strong vein running parallel, are the encouraging features about this property.

Perrier.—This property, although it is supposed to have been bonded during the year, has not been operated so far as I am aware.

Gold Hill Group.—This property, situated on Forty-nine creek, was worked most of the year. Two cars of ore shipped to Trail smelter netted, I am told, $50 a ton in gold alone, and another car is now ready for shipment.

Birdseye Group.—This property, situated near Nelson, is owned by an English syndicate, which has been steadily pushing development during the year, resulting, I am informed, in disclosing a promising vein of gold ore.

Noonday Group.—This property, situated on Sitkum creek, 9 miles from Nelson, was idle during the winter, lack of capital being the reason, I understand.

California.—This group, situated near Nelson, is being operated by a Spokane syndicate, which has also taken over the *Athabasca* group and mill, which latter was run continuously during August and September, putting through the ore in the bins which was stoped from the *California* last winter. An average of 6 men was employed. A new raise is being started immediately.

It is rumoured that a deal is pending for the *Queen* mine on Sheep creek, which has not produced for several years, but is credited with a total production of about $2,000,000 in gold.

Another well-known mine which has lain dormant for some time, but which is assuredly capable of producing a large tonnage for years to come, is the *Second Relief* on the North fork of Salmo river, about 14 miles from Erie, a reconstruction of the affairs of which, rumour has it, is under way.

A new location which shows considerable promise is the *Champion* group of two claims—*Champion* and *Champion No. 2*—staked in the spring by S. N. Ross, of Salmo. These claims are situated near Park Siding and some good ore is reported to have been struck, 20 tons of same shipped to Trail being said to have given excellent returns.

There are a number of other properties with good showings in the district, their owners mostly being prospectors who, for lack of capital, are unable to develop their claims. They would no doubt be willing to lease or bond, so that there seems to be plenty of scope within this Division for investors looking for promising gold properties.

PLACER.

A group of four placer claims aggregating 1,000 feet in length were staked on the North fork of Salmo river, about 2 miles from Erie, in the fall, by four miners calling themselves the Carlson Partnership. This locality had been worked in former years and some fairly coarse gold recovered, but insufficient, no doubt, to make it a really remunerative proposition.

Considerable dead-work has been done by the new locators, including the building of several hundred feet of ditch and installing of sluice-boxes, and a quantity of overburden has been removed by ground-sluicing. There is evidently some fairly coarse gold in the gravel, but the men are hampered in their operations by the numerous very large boulders in the ground, and also claim that the false bed-rock of clay, on which the values apparently lie, robs the boxes of considerable of the gold.

As these claims are located on land which has passed from the Crown, the partnership was required to furnish security to cover possible damages. This they apparently had no difficulty in doing, and provided satisfactory bonds to the extent of $1,000, thereby showing that they are in earnest in the endeavour to make the operation a success.

The only other placer claim recorded during the year was on Forty-nine creek, where an old placer-miner has been working and employed another man for a time, but as he was then engaged in dead-work it is unlikely that the employed man's wages came out of the ground, but rather out of his employer's pocket. There is undoubtedly placer gold on this creek, and it is to be hoped that the old-timer's courage and industry will eventually be amply rewarded.

ARROW LAKE MINING DIVISION.

WALTER SCOTT, MINING RECORDER (OFFICE AT NAKUSP).

I have the honour to submit the annual report on the Arrow Lake Mining Division for the year ending December 31st, 1921.

Millie Mack.—H. E. Forster has had men doing development-work all summer, and has 16 tons of ore sacked up ready for shipment when snow comes; 12 tons was shipped in January.

Tillicum Group.—This property comprises the *Tillicum, Cultus,* and *Valley View* claims and is owned by Reveler & Robson, who have been working all summer on the property and have 4 tons of shipping-ore on the dump. Assays from the property ran: Gold, $40 to the ton; silver, 100 oz. to the ton. The property is looking well.

Hoodo Group.—Owned by Prough & Reimer, who are getting out shipping-ore. The property is looking well.

ROSSLAND DISTRICT.

TRAIL CREEK MINING DIVISION.

Report by H. R. Townsend, Gold Commissioner.

The only new development in the mining situation in this district during the year has been on the *I.X.L.* property, which is being worked by a local syndicate under a lease. Twenty-three tons of high-grade free-gold ore was taken out; the lessees are continuing and are greatly pleased with their prospect.

The Velvet Syndicate continued work on the *Velvet* until the snow came, when they shut down owing to the difficulty of shipping, as it was found impossible to get teams to transport the ore down to Northport, to which point it must now be taken as the Great Northern ceased operating their trains into the Province last fall.

The Consolidated Mining and Smelting Company of Canada, Limited, has continued with a small force of men on the Rossland properties and shipped 82,092 tons to the smelter.

The *Le Roi No. 2* kept a force of about forty men at work and experimented on a milling process, the success of which is not yet fully determined.

Alexander Constantine has done considerable work on the *Pearl* mineral claim on Record ridge; he is sanguine that the property will prove satisfactory and has brought in some encouraging samples.

As a result of the rich ore struck on the *I.X.L.* some Eastern people came in and inspected some properties owned by them in this vicinity, and expressed their intention of commencing operations on their claims as soon as possible in the spring.

SOUTHERN DISTRICT (No. 4).

REPORT BY PHILIP B. FREELAND, RESIDENT ENGINEER.

INTRODUCTORY.

The above district, comprising four Mining Divisions—Grand Forks, Greenwood, Osoyoos, and Similkameen—is situated in the extreme south centre of the Province of British Columbia.

A good deal of time was spent in the examination of properties in the Vernon and Ashcroft Mining Divisions, which prohibited some exploration-work planned on the headwaters of the Roche and Skagit rivers. Reports came in last year of some attractive low-grade silver veins from that locality, but nothing could be done until transportation was improved.

A glance at the prices of metals for the year will account for the large decrease in tonnage in this district as elsewhere. Only the higher-grade silver-lead mines were able to continue operations, and it is doubtful if they did much more than pay expenses.

Towards the end of the year the gradual increase in the price of copper and a decrease in the operating costs again stimulated interest in mining. Owners of gold properties, unable to operate for the past year and a half, are overhauling their plants and doing development-work with the intention of active operations in the spring.

A good many individuals and small companies have been intensively prospecting the old placer-grounds of Rock creek, Granite creek, and the Tulameen river, with indifferent results. It seems unlikely that such prospecting, without the aid of core-drills, will more than pay wages, for history relates that nearly all the shallow ground has been placered, first by white men and then by the Chinese, which leaves small opportunity for those who come after. In the bottom of the creeks and rivers there is a good chance of finding gold, as these areas were beyond the reach of the individual twenty years ago on account of the lack of equipment.

In 1918 the Munitions Resources Commission reported as follows: "Below the mouth of Slate creek and for 3 miles down-stream the Tulameen river widens out to an average of 900 feet, and the gravel lies in large bars and low-lying benches at depths from 20 to 100 feet." The total area was estimated by the Board to be about 15,000,000 cubic yards, most of which consists of heavy, coarse pebbles, with many boulders about a foot in diameter. Large boulders are occasionally encountered, but are by no means numerous and should not present any insuperable difficulties in dredging operations.

Eleven holes were put down by the Commission, the deepest being 72½ feet and the shallowest 11 feet, with a total of 516 feet drilled. Six holes were put down to bed-rock, the others being stopped at depths at which values did not warrant further drilling. These holes only covered a small portion of the area near Slate creek, and consequently nothing definite can be said about the value of the whole ground for dredging operations, but they were attractive enough to justify more drilling to prove its possibilities.

The reason that the Munitions Commission did not continue to search was that platinum was needed at once and the drilling of the entire area and installation of a dredge would take about twelve months to accomplish.

The ground between Tulameen and Princeton, about 20 miles distant, has never been worked owing to the fact that the gravels are heavy and generally deep. Detailed results of the sampling of the Tulameen gravels by core-drills by the Munitions Commission are to be found in their report published in 1920, together with a map of the river showing the location of the drill-holes.

PROSPECTING.

It seems likely that most of the ore-deposits of large dimensions showing a mineralized outcrop have been discovered, although in a great many cases they have not been thoroughly prospected, but Crown-granted before a proper idea of their value can be estimated. There are, however, as already proved in the Phoenix camp, many ore-bodies that do not outcrop and do not show any mineralization, though close to the surface. These covered areas often occur on a contact of limestone with an igneous rock or in a depression where the gangue of a lead happens to be of softer material than the surrounding rock.

Jewel Lake, Greenwood M.D.

White Lake, Osoyoos M.D.

UNIVERSITY OF ILLINOIS LIBRARY

Prospecting in the district has fallen off considerably in the past three years, owing not only to the low price of metals, but to the idea that the district has been thoroughly prospected, which is not the case.

I have mentioned in previous reports that the district is better equipped with railway, wagon-roads, and electric power than any other part of British Columbia, which is a most important feature when considering the prospective assets of a mine.

There are two possible placer-grounds that have not received much attention in the past—i.e., the benches along Pass creek, as well as the creek-bottom itself near its source. Jewel (Long) lake formerly discharged into Pass creek, and from thence into the Granby river. Also in the vicinity of Fairview, where there are many quartz leads bearing free gold.

The headwaters of the main Kettle river and Cherry creek also have developed placer-grounds, which have not been thoroughly prospected. Some coarse-gold nuggets were brought in from that region this year.

DIAMONDS.

Whilst prospecting for the ordinary minerals in and near the dunite and serpentine dykes which frequent the district, especially in the neighbourhood of Cascade, Grand Forks, Greenwood, Rock Creek, and Tulameen, the prospector would do well to remember that these rocks in some parts of the world, including Tulameen, B.C., and Arkansas, U.S.A., contain diamonds. The Tulameen rocks contain only microscopic diamonds associated with the chromite so far as research has shown. Little investigation has been made in the placers.

Most of the larger diamonds in other parts of the world have been found in the oxidized or serpentinized zone. There are fairly large areas of this serpentine in the Wellington camp, near Phoenix, and also above Cascade. In the Arkansas serpentine there is no chromite present.

The larger valleys present rather too big a field for the prospector, so it is advisable to confine his efforts to smaller depressions near the serpentine when searching for diamonds in the gravels.

Microscopic diamonds have been found in the gravels adjacent to the serpentine rocks in the Boundary country.

TOTAL TONNAGE AND CONTENTS IN MINING DIVISIONS FOR 1921.

Division.	Ore.	Gold.	Silver.	Copper.	Lead.	Fluorspar.	Coal.
	Tons.	Oz.	Oz.	Lb.	Lb.	Tons.	Tons.
Grand Forks	40,411	541	5,745	432,505	.....	6,742	.....
Greenwood	402	69	111,624	.....	51,268	....	.....
Osoyoos	845	125	42,682	.....	.....	....	.....
Similkameen	.....	.....	.....	.....	.....	....	77,310
Totals, 1921	41,658	735	160,051	432,505	51,268	6,742	77,310

A total of 14,869 tons of lime-rock was shipped from the Fife quarries to the Trail smelter for fluxing purposes.

OSOYOOS MINING DIVISION.

Hedley Gold Mining Co.

Operations in the mine and mill were suspended until autumn of 1920 on account of the high cost of operation. During the summer development-work commenced in the mine, followed by repairing the mill and dam, preparatory to active operation in the spring or as soon as the ice has gone from the Similkameen river. Portions of the flume on Hedley creek have been destroyed and will have to be repaired before water can be obtained for milling purposes. The Provincial Government lent assistance in repairing the bridges on Hedley creek to enable the company to haul lumber for the flume.

Peggy and Rawhide Group.

This group consists of the *Peggy*, *Rawhide*, *R.A.*, and *Portland* claims, owned by Jim Walker and D. H. McKinnon, of Hedley, and is situated on the south-west side of Hedley creek at an elevation of about 2,400 feet above Hedley, 2 miles distant. Nearly the entire group is on the Chuchuwha Indian Reserve

and the owners have been unable to get permission from the Indians to ship any ore, so that further exploitation seems inadvisable for the present.

On the *Peggy* an open-cut 15 feet wide in a highly siliceous limestone shows pyrrhotite, pyrite, and specks of chalcopyrite.

On the *Rawhide*, which lies farther down the slope of the creek, a tunnel has been driven in 35 feet, cutting the limestone and silicified wall-rock. The limestone is well mineralized with pyrite and chalcopyrite. A sample taken over 15 feet gave: Gold, trace; silver, 1 oz.; copper, 1.70 per cent. There are good possibilities on this claim, as in the vicinity there are many outcrops of limestone well altered and containing iron and copper.

Horn Silver Mine.

Active operations were carried on through the year by this company under the management of B. Powell, of Similkameen. Most of the work was confined to the lower tunnel and 845 tons of gold and silver ore was shipped to the smelter. This is one of the few properties which have operated continuously since 1914. About fifteen men were employed during the year.

White Lake Basin.

Development-work by means of a tunnel about 200 feet long opened up a 4-foot seam of coal, said to be of a good variety. The owners, who are now incorporated as the White Lake Collieries, Limited, with offices in West Summerland, state that they intend to put a diamond-drill on the property to exploit it thoroughly. Analyses of coal taken from the development-drift showed a higher fixed carbon and lower ash percentage than near the surface. It is to be hoped that this condition will persist at depth.

Silver Crown.

This claim is situated about 1½ miles from the east side of the Similkameen river, on the International Boundary-line. A wagon-road has been built from Oroville, Washington, up the Similkameen river on the east side, and a rough branch from this to the claims. The first work was done upon the *Submarine* mine, located on the United States side of the boundary and adjoining the *Silver Crown*.

The vein on the *Submarine* claim varied in size from 10 to 15 feet in width and was exploited by means of open-cuts, a shaft, and two tunnels; one tunnel under the vein 400 feet in length and another drift on the vein 585 feet. The greater part of the lead in the upper tunnel passed through what appears to be an exceedingly low-grade quartz. Occasionally segregations of mineral showing argentite, chalcopyrite, galena, and iron, with a small percentage of calcite, are found. These minerals carry very high values in gold and silver.

The work on the *Silver Crown* was done after the development of the *Submarine* and shows a continuance of the lead of about the same size, striking generally N. 75° E. (mag.) and dipping nearly flat. Tunnels 90, 95, and 100 feet respectively, from 50 to 100 feet apart, form the development-work done on this claim. The lead here exposed is undoubtedly a continuation of the *Submarine*, for it is traced by open-cuts on the surface for 1,500 feet.

The quartz in the tunnels of the *Silver Crown* is crushed and oxidized in the fractures and carries low values in gold and silver. A thorough sampling of the vein will have to be made before any definite conclusion can be arrived at regarding possible profitable operation. The high values in the segregations added to the lower values of the main body of quartz may make an average tonnage value which would pay the owners. It might also be advisable, if possible, to continue the development on the *Silver Crown* to a point where the lead dips into the hill and the oxidized zone is passed.

The location of these claims, within 2 miles of the Great Northern Railway and about 4 miles from the high-power station, makes them attractive from a transportation and cheap fuel standpoint.

King Edward Group.

This group of claims, consisting of the *King Edward*, *Bank of England*, and *Yellow Jacket*, lies on a high ridge between Hunter creek and Susap creek, about 3 miles from the Similkameen river on the west side, 10 miles south of Keremeos. Most of the work on these claims was done many years ago, except on the *King Edward*, which was exploited during 1918 for its molybdenum content. A tunnel was driven 35 feet on a quartz lead varying in thickness from 1 to 20 feet. About 4 feet on the hanging-wall near the face of the drift was well mineralized with chalcopyrite, pyrite, and molybdenite. Samples taken from this lead over 4 feet gave: Gold, trace; silver, 1 oz.; copper, 1.60 per cent. Several open-cuts were excavated about 100 feet west of the tunnel, where there was a strong indication of molybdenum in the fractures of the granite.

On the *Yellow Jacket* a 25-foot shaft has been sunk, following small fractures in the granite filled with pyrite, chalcopyrite, and copper carbonates. A tunnel 30 feet long was also driven on a small mineralized fracture about 2 inches wide.

On the *Bank of England* a tunnel had been driven 60 feet and a cross-cut from the face about 30 feet. There was a small stringer of sulphides of iron and copper on one side of this tunnel which was too small for any tonnage prospect.

FAIRVIEW CAMP.

Boyles Bros., of Spokane, Washington, did several hundred feet of diamond-drilling for Eastern capitalists in this camp. It is generally understood that drilling will proceed when the weather conditions improve. The large quartz veins in this vicinity contain some free gold, and if the values are as persistent in depth as on the surface, active operations may be looked for in the future.

SIMILKAMEEN MINING DIVISION.

Canada Copper Corporation.—This company continued to be inactive during the year, chiefly on account of its inability to operate at the low price of copper. If the price of metals continues to rise, it is probable that during 1922 work will commence. There are several slides and washouts on the railway between Princeton and the mine which will have to be cleared away and filled before any ore can be shipped to the mill or concentrates to the smelter.

Princton Coal and Land Co.—Production was carried on throughout the season on the company's property at Princeton, and the total output from the mine amounted to 13,966 long tons of coal, of which 10,756 long tons was sold and shipped.

Coalmont Collieries, Ltd.—A good deal of hard luck accompanied the operations of this company at Coalmont during the year. Amongst minor mishaps were the loss of a large portion of new cable by fire and several breaks in the operating cable, which delayed operations in the mine. The total shipments made were 59,709 long tons of coal. Development-work amounted to about 1,250 feet of main tunnel on No. 3, with a counter-level 1,600 feet, with development panels between and above. No. 2 level was not extended, but developed by a counter-level and panels.

Princeton Mining and Development Co., Ltd.—This company owns the *Copper Farm* mine, situated about 4 miles east of Princeton. Last year a 3-drill Rand compressor and 80-horse-power boiler were installed. This year the lower main drift was extended and an upraise driven 125 feet to connect with No. 2 level. It will require about 75 feet more upraising to connect to two levels. Some small stringers of copper sulphides and carbonates were struck in the raise and an oxidized zone developed at the top of the raise. The location of these claims within a few hundred feet of the Great Northern Railway and river is good, and should an ore-body be developed the expense of operation could be kept at a minimum. Future development is looked forward to with interest. The property is managed by Fred Foster, of Princeton.

ROCHE RIVER SECTION.

Red Star and Anaconda.

These claims are owned by Bonnybier & Pouel, of Princeton. The lower crosscut tunnel, driven 500 feet, was abandoned for the present on account of bad air. A new open-cut was started farther up the hill with the idea of tracing the vein on the surface as a future guide to driving the lower crosscut tunnel. The upper workings consist of three tunnels, 250, 400, and 65 feet respectively, in the mineralized zone, in which there are lenses of chalcopyrite carrying gold and silver varying in thickness from a few inches to 4 feet in a gangue of quartz. Unfortunately the upper tunnels were partially caved owing to the crushed and slippery nature of the schistose formation, and only a part of the workings could be examined. Over an area about 500 feet in length and 200 feet wide copper carbonates were seen in the fractures of the rock.

Knob Hill.

The owner of this claim, John Bowman, of Princeton, continued driving a crosscut tunnel at an elevation 50 feet below the open-cut and shaft, which proved a shear-zone containing 4 feet of ore carrying chalcopyrite and chalcocite, as well as carbonates of copper. About 60 feet from the mouth of the crosscut tunnel what appears to be a parallel lead was cut, containing values up to 3 per cent. copper and a trace of gold and silver. The lead strikes N. 50° W. (mag.) and dips 50° S.W. The surrounding formation is a sericite schist.

SUMMIT CAMP.

Bluebell and Mountain View.

W. Hess continued the exploitation of these claims throughout the winter and early summer. Several open-cuts were excavated on the lead and a tunnel driven 80 feet, 25 feet below the cuts. Surface indications proved a very narrow stringer, traceable for over 1,000 feet in an easterly and westerly direction (mag.) Small particles of silver-lead were found in the vein, but these were not persistent. In the lower tunnel a lead was developed about 1 foot wide, carrying values in silver and lead. The country-rock is a highly metamorphosed sedimentary, cut with numerous dykes.

Stephenson's Claim.—Vancouver interests took a bond on this claim with the intention of shipping some ore. At the time of the arrival of the men the workings were full of snow and water. The data on the operations of these interests are not to hand.

LAW'S CAMP.

Assessment-work was done on some of the claims in this camp by Louis Marcotte, of Coalmont, and a better grade of ore encountered. Formerly the ore contained too high a percentage of zinc to be shipped profitably, but the new work has developed a grade higher in silver and low enough in zinc to make it a profitable undertaking. It was the intention of the owner to do more work this winter, and it is to be hoped that more ore free from zinc will be found.

TULAMEEN RIVER.

Several small parties of men continued to placer for gold and platinum along the benches of the Tulameen River in the vicinity of Olivine mountain. No information is to hand regarding the amount of gold or platinum taken out.

GRAND FORKS MINING DIVISION.

Emma.

This property, owned by the Consolidated Mining and Smelting Company, was shut down early in the year, and after mining the sills and pillars the mine was dismantled. The ore was generally low grade, carrying about 1 per cent. copper and a little gold and silver. It was valuable to the company chiefly as a flux for use in their furnaces at Trail. The total shipments amounted to 18,800 tons.

Rock Candy.

This mine was worked for a short period during the beginning of the season. Some difficulty was experienced in separating the silica from the fluorite so that the percentage of silica could be kept below 6 per cent. The lower price of the mineral and lack of demand prohibited further shipments of concentrates being made and the mine was temporarily closed. A total of 6,742 tons of concentrates was shipped from the mill.

Fife Lime-quarries.—A total of 14,869 tons of lime-rock was shipped from this property, on Christina lake, to the Trail smelter for fluxing purposes.

FRANKLIN CAMP.

Union.

The Union Mining and Milling Company was incorporated in 1920 and an endeavour made to sell stock for development purposes. The tightness of the money market and the uncertainty of the cost of supplies, etc., prohibited success along these lines for the time being. The gradual rise in the price of metals and general stabilizing of conditions point to better times in the mining business, and it is to be hoped that the owners will meet with success in their venture in 1922. The mine as it stands at present is well worth developing, and the finding of other secondarily enriched ore-bodies will greatly enhance the value of the property and make possible by combination the mining of any ore-bodies which are too low grade to mill.

Davenport and Dawn.

These claims are owned by Bert Averill, of Grand Forks, and are situated near Franklin creek in Franklin camp, about 45 miles from Grand Forks, on what is locally known as the "Black Lead" or "Pyroxenite" area. Development-work consists of a tunnel 75 feet long and a shaft 20 feet deep in and near the contact of the pyroxenite and syenite rocks. At the end of the tunnel on the contact a small lens of highly mineralized pyroxenite was cut, containing minute specks of

bornite and masses of chalcopyrite. A picked sample of this rock carried values of 11 per cent. copper and 0.11 oz. in platinum. Future development of this lens of ore will be looked forward to by those who are interested in the finding of commercial quantities of copper-platinum ore in the olivine rocks.

Maple Leaf.

At the request of the stockholders of the Maple Leaf Mines Company, most of whom are residents of the United States, a careful sampling of the lower workings was carried out. During the past few years remarkable results were obtained, presumably from samples taken from the mine by the former management and others. These samples showed a fairly high percentage of lead, copper, gold, cobalt, and platinum, as well as its alloys, resulting in a good deal of speculation by the public. The results of samples taken on a tonnage basis over areas said to contain the above-specified minerals were practically *nil*, showing no lead, cobalt, or platinum, or its alloys, and only a very small percentage of copper.

The country-rock in the mine and vicinity is a highly altered volcanic tuff, cut by two porphyry dykes about 4 feet wide running diagonally through the tuff. In the vicinity of these dykes, which were injected after the forming of the tuff, a large amount of fracturing has taken place. In the fractures a good deal of iron oxides and carbonates have been deposited, and it is possible that the mineral was scraped out and some high assay results obtained. This is not a proper means of obtaining a fair tonnage average. In the upper workings there are segregations of copper ore in and near the contact of the pyroxenite and syenite rocks which give a fairly high ratio of platinum to copper-sulphide content, but these segregations are small and will need more development before the zone can be mined profitably.

If the money spent in driving the lower tunnel about 340 feet and on the partial installation of a 50-ton smelter and ore-bins had been used for legitimate development in and near the upper workings, the stockholders would have the satisfaction at least of knowing that their money had been spent in the right place. As it stands now their money is gone, there is no ore developed, and the confidence of the public is shattered.

Paulson District.

Terzic.

A 25-foot open-cut was driven to tap the bottom of the old shaft about 10 feet below the surface. The lead was cleaned off and about 4 feet of ore exposed. Samples taken from the ore carried: Gold, trace; silver, 0.60 oz.; copper, 1.7 per cent.; lead, 2.5 per cent.; zinc, 5 per cent. The formation is an altered limestone in contact with greenstone, with tongues of granite intruded into the limestone. This is a good prospect and if a larger tonnage could be developed it might find a ready market.

Christina Lake.

Shamrock Group.

This group of claims, consisting of the *Elmore*, *Congdon*, and *Shamrock*, is situated on Shamrock hill, about 1½ miles north-east of Christina lake. The mineralized area covers about four claims and constitutes outcrops of pyrrhotite interspersed with chalcopyrite. The country-rock is mainly greenstone, covered by remnants of limestone and intruded in places by olivine rocks. Along the line of contact between the limestone and greenstone a good deal of alteration has taken place, forming garnetite and epidote carrying copper and iron sulphides. These claims were prospected about twenty years ago, when Rossland camp was booming, and all the work seems to have been done on the pyrrhotite outcrops and little or no attention paid to the copper-contact minerals. A closer examination of these claims might be beneficial to the prospector.

Lightning Peak Camp.

Rampulo and Silver Lump.—The owner of these claims, B. Cortiana, did a considerable amount of work during the summer, driving a 400-foot tunnel and 27-foot upraise. Silver-sulphide ore was struck in this tunnel scattered through the limestone, carrying values of 157 oz. in silver and 0.35 oz. in gold to the ton. There are no definitely defined walls to the lead at present.

Lightning Peak.—This mine was leased to William Williams and a 400-foot drift commenced with the idea of developing the vein about 40 feet below the old winze. Some good ore is being encountered in segregations in a 4-foot lead. This ore has a high lead content. Numerous shipments have been made by the former lessees.

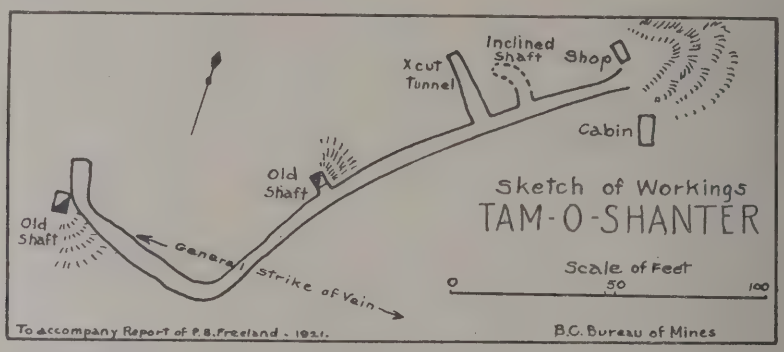
GREENWOOD MINING DIVISION.

A genuine endeavour was made by the prospectors and mining men of Greenwood to thoroughly exploit the country in the vicinity of the town for ore-bodies large enough to promote the welfare of the mining industry, which in the last few years has gradually declined. Some success was met with on the *Tam O'Shanter*, where Al. Morrison and Dan McGillis opened up a vein of gold, silver, and lead.

The operation of the *Providence* mine under the management of the owners was anything but a success, and the mine closed down after a few months, owing a considerable amount for labour, supplies, etc.

Providence. The owners of this property, C. Madden *et al.*, of Chicago, carried on operations for a short time during the summer and shipped 97 tons of gold-silver-lead ore to the smelter. Under the management of Al. Morrison and Dan McGillis, of Greenwood, the operation of this mine was a success, and the owners would do well to lease this property to them in the future. The presence of the secondary silver minerals in the lower levels is evidence of possible payable ore-bodies in the mine yet undeveloped.

A demand has been made by the bondholders for the payment of the principal, $50,000, and interest now due on the bond issue. The total, plus interest, notes, material, labour, etc., amounts to $85,024.48. If this amount is not immediately taken up by the stockholders, foreclosure proceedings will be taken.



Vendella. This claim, located about a mile west of Anaconda, is owned by R. Pascoe, Bombini, *et al.*, of Anaconda, near Greenwood. An open-cut driven 25 feet on a contact of greenstone and limestone developed segregations of pyrite and chalcopyrite. Most of the mineralization occurred in the altered limestone. The gangue contained calcite, epidote, garnetite, with inclusions of black tourmaline containing specks of chalcopyrite and a trace of nickel. About 1,500 feet farther south boulders of the same material were found embedded in the wash.

The location of this claim, within easy reach of the Canadian Pacific Railway and high-power line, is excellent, and should a body of ore be developed the mining and transportation costs will be low. It is to be hoped that the owners will endeavour to prove the extension of this outcrop along the lines of contact by open-cuts and stripping.

A sample taken from the dump of the open-cut assayed: Gold, trace; silver, 0.80 oz.; copper, 2 per cent. Separate analyses proved the presence of nickel.

Last Chance. Some Greenwood interests examined this property, which had been operated several years ago, with the idea of opening up the old workings by means of a tunnel about 300 feet long. A thorough examination of the property was impossible on account of water in the shafts. Some high values were obtained from samples taken from the old dumps, but no average tonnage value could be arrived at. It is quite possible that there is some good ore left in the mine, but it would be extremely unwise for any one to drive a tunnel to tap the lower workings without first unwatering the shafts, exploring the lead, and thoroughly sampling it.

The ore sampled from the dump contained tetrahedrite, galena, zinc, and pyrites in a gangue of highly metamorphosed limestone. Values obtained were: Gold, 0.46 oz.; silver, 81.2 oz.; lead, 2 per cent.; zinc, 5 per cent.

Helen. A lease was taken by Ole Lofstad on this old mine, which is situated within half a mile of Greenwood. Two tunnels were driven at lower elevations than the outcrop and a small quartz lead developed. Samples taken from the old shaft-workings gave results varying from a trace in gold to 1.50 oz.; 2.60 to 31 oz. in silver, and 7 to 26 per cent. lead to the ton. This property is well situated for transportation, power, etc.

Bonny Bell. This property is situated on the east side of Deadwood, adjoining the wagon-road. The lessee, O. Lofstad, sunk an inclined shaft on a quartz lead about 40 feet deep. The vein varied in width from 2 inches to 1 foot and carried silver-lead and pyrite. The quartz was only mineralized in small lenses, too far apart to make the ore a commercial one. Samples from these lenses gave a trace in gold, 35.5 oz. in silver, and 18 per cent. lead to the ton.

Crown Point. This old Crown-granted claim, situated on the south side of James creek, was leased by James Kerr, of Greenwood, and the old shaft cleaned out and a crosscut tunnel driven across the ore-body 10 feet. The ore occurs as segregations in the limestone and contains 0.10 oz. in gold and 6 oz. in silver to the ton, and 4 per cent. lead. Very little could be seen beyond the workings because the hillside was deeply covered with gravel and loam. It is possible that a fairly large body of low-grade ore could be developed in this shaft.

Long Lake Camp.*

Roderick Dhu. Greenwood interests took an option on this claim, which is situated to the north of Jewel lake, on Roderick Dhu mountain. Very little work has been done on this claim since 1903, when a shaft was sunk about 75 feet and some ore stoped out to the surface for 100 feet to the south of the shaft. This shaft was filled with water at the time of examination, so nothing could be seen of the lead at depth. On the surface the quartz vein, varying from 2 inches to 1 foot in width, was mineralized with galena, pyrite, and limonite in the fractures, and carried values of 1.12 oz. in gold and 1.50 oz. in silver to the ton. This lead could be traced for about 500 feet north-east, where another shaft had been sunk 25 feet in the quartz. At this point the lead seemed to be more or less barren of values. Beyond the second shaft the vein was displaced by the intrusion of a pulaskite-porphyry dyke about 200 feet wide. The walls of the vein were gneiss.

Moonlight. This claim adjoins the *Roderick Dhu* on the north and is partially developed by open-cuts and shallow shafts on a quartz lead varying in width from 10 inches to 2 feet and traceable over a distance of 1,000 feet. The vein is not well mineralized, as far as the development shows, carrying values of 0.10 oz. in gold and 4 oz. in silver to the ton. The size and persistency of the vein warrant further exploitation.

Electric. The partial prospecting of this claim adjoining the *Roderick Dhu* to the south, was carried on by Greenwood interests in the autumn. One of the old open-cuts was cleaned out and a tunnel driven on the lead for 50 feet. For 12 feet in from the mouth of the open-cut and tunnel good ore was struck, averaging about 1 foot in width and carrying 1.68 oz. in gold, 22.9 oz. in silver, and 1.60 per cent. lead to the ton. Beyond this point the vein was crushed for about 12 feet, coming in again near the face and showing only quartz barren of values. This lead strikes north and south (mag.) and dips 64° to the east.

Ethiopia. G. Duhamel, of Greenwood, took a lease from the Government on this claim, situated on the south side of Jewel lake, and extended the old crosscut tunnel, as well as drifting on a lead to the east and west. This vein was cut about 60 feet from the mouth of the tunnel and showed bad fracturing and displacement as far as the face of the drift. Some galena and pyrite occurred in and along the fractures. On the surface beyond the end of the crosscut several open-cuts exposed a well-mineralized quartz lead carrying gold and silver. This vein dips flat into the hill and probably is beyond the end of the crosscut. Its strike coincides with that of the *Jewel* and may possibly be an extension.

Wallace Mountain.

In spite of the many ups and downs in this camp during the last ten years, due chiefly to the extremely complicated system of faulting of the veins, the present owners of the *Bell*,

* The old name of Long lake has been changed by Geographic Board to Jewel lake, as the former name conflicted with Long lake at Vernon.

Westkettle River, between Beaverdell and Carmi.

Sally Mine, Greenwood M.D.

UNIVERSITY OF ILLINOIS LIBRARY

D. McIntosh and P. Crane, and Ed. Nordman, superintendent of the Wallace Mountain Mines, Limited, owners of the *Sally group*, are to be congratulated on the success of their efforts in keeping up the shipments of ore to the smelter. To-day the *Bell* and *Rob Roy* are in splendid condition and some very high-grade silver ore has been developed, giving expectation of a larger output for 1922.

Bell. Operations on this mine were continued throughout the year in spite of the lower price of silver and high cost of supplies. Development-work was kept well ahead of the stopes, which meant continual crosscutting on account of the extreme faulting of the ground. A compressor installed two years ago enabled the owners to use machine-drills, which greatly facilitated the exploration-work. A good shoot of very high-grade silver ore was struck late in the year; values up to 6,000 oz. in silver having been obtained. The total shipments were 107 tons of gold, silver, and lead ore.

Sally Group. This group consists of the *Sally* and *Rob Roy* claims and is owned by the Wallace Mountain Mines, Limited, of Penticton. Practically all the tonnage shipped and development-work was done from the *Rob Roy* claim, which adjoins the *Sally* on the north. An average of 11 men was employed and the total shipments amounted to 176 tons, with an average silver content of 323 oz. of silver to the ton. Development consisted of 477 feet of drifting, 496 feet of crosscutting, and 33 feet of upraising.

Highland Lass. This claim is situated a quarter of a mile to the north of the *Bell* mine, and is owned by I. Hallet, of Greenwood. An open-cut and tunnel 50 feet long was driven on the lead and about 10 tons of ore excavated. A fault near the face of the drift caused some trouble, but the lead was found again to the north of the fault. The lead consists of quartz and small particles of country-rock and strikes N. 70° E. (mag.), having a width of about 1 foot. A grab sample from the sorted ore gave 0.12 oz. in gold, and 959 oz. in silver to the ton, 24 per cent. lead, and 6 per cent. zinc. A good deal of fine carbonates were taken in this sample, which probably accounts for the exceedingly high percentage of silver. No shipments were made.

Napanee Group. After several years of diligent searching, C. G. Cummings, the owner of this group, discovered a vein of gold, silver, lead, and zinc ore. Although the wall-rock appears to be more or less shattered, there is every indication of the lead being in-place. The width of the vein is 5 inches and the strike N. 65° E. (mag.). A sample from the vein assayed 0.20 oz. in gold and 32 oz. in silver to the ton, 7 per cent. lead, and 14 per cent. zinc. The gangue was quartz. The zinc content is high, but may not prevail.

Highland Chief.—This claim is owned by Ed. Maloney, of Penticton. A high-grade silver-lead vein was uncovered and a tunnel driven in about 20 feet, when a fault was encountered. No more work was done to try and locate the lead, so the 2 tons of ore excavated was shipped to the smelter.

Kokomo.—This mine shipped 10 tons of high-grade silver-lead ore to the smelter at Trail.

Castor Frac.—Sutherland & Thompson, lessees, shipped 2 tons of silver-lead ore to the smelter.

Skylark Camp.

Surprise No. 3. This claim was again prospected by Joe Cunningham, of Greenwood, and a new lead of silver-lead discovered to the north-west of the old shaft. A vertical shaft was sunk 20 feet on the lead to a fault, which was followed down at a lesser angle for 10 feet and drifted on for about 35 feet. The vein from the surface down was badly broken and the ore, a silver-lead, and zinc occurred in small lenses. Other shallow shafts were sunk and the same condition found. It seems probable that the extreme faulting is a surface condition in the cover-rocks and that when some greater depth is attained the lead will be more consistent.

Boundary Falls.

White Star. The owner of this claim, Mark Christianson, of Boundary Falls, sunk an inclined shaft 40 feet deep on a quartz lead about 18 inches wide in the argillites. Small segregations of pyrite occurred in the vein carrying low values in gold and silver. The vein is well formed and outcrops persistently. A tunnel driven under the outcrop seems to be the best method of developing this vein and will be less expensive than sinking a shaft.

Texas. This claim lies to the north-east of the *Providence* group and is owned by Geo. Swanland, of Boundary Falls. Only a small amount of work had been done at the time of examination, consisting of a trench, small open-cuts, and a tunnel 15 feet long. The lead, striking north-east (mag.), composed of quartz, was only about 2 inches wide, showing small stains of oxide of iron. The country-rock was a greenstone, intruded in the vicinity of the workings by alkali-syenite dykes. A sample of quartz gave a trace in gold and 0.70 oz. in silver to the ton.

Deadwood Camp.

Golconda. Operations were first commenced on this claim in 1907 by Quebec interests and a shaft sunk 45 feet, open-cuts 100 feet, and a crosscut tunnel 690 feet. The old shaft was sunk on a pyrrhotite-capping, which contained values on the surface of 0.78 oz. in gold and 0.50 oz. silver to the ton. The ore, if any, at the bottom of the shaft was not explored because of water. The open-cut showed extensive mineralization near the shaft. The long crosscut tunnel was driven with the intention of prospecting the area about 200 feet below the open-cut. Evidently those interested ran short of capital before the venture was proved. E. A. Wanke, the present owner, drove another crosscut tunnel 110 feet long and 190 feet below the shaft, farther to the north than the old tunnel. About 200 feet more will have to be driven before the tunnel is vertically under the shaft.

The country-rock surrounding the workings is a greenstone, capped by altered volcanic tuffs. It seems advisable before doing any more development-work to unwater the shaft and find out the value and size of the ore-body in the bottom.

Rock Creek.

Riverside. Paul Nelson and Oli Lofstad *et al.*, of Oroville, Wash., and Greenwood, leased this claim from the Government and drove a crosscut tunnel 60 feet, another 40 feet, and 15 feet of upraise, besides building log houses and cook-shack. In former years, when transportation was difficult, several hundred tons of ore was mined, sorted, and shipped to the smelter, averaging about $50 to the ton. Average samples taken over 3 feet of lead-matter near the collar of the inclined shaft gave 0.08 to 0.12 oz. in gold, 29.5 to 34 oz. in silver, 3.5 per cent. lead, and 7 per cent. zinc to the ton. It was impossible to take any samples lower down the shaft because of water.

This zone near the collar of the shaft was highly oxidized and may not be representative of the ore lower in the workings. Only when the shaft is unwatered can a proper estimate be made of the value of the mine. The crosscut tunnel, now being extended, will develop the zone near the bottom of the shaft in another 40 feet. The close proximity of the railway, river, and high-power electric line greatly adds to the possibilities of operating the mine profitably.

Summit Camp.

Blue Bell. This property, formerly owned by W. Shaw and Jack Dorsey, is now being prospected by Mike Blufontein, of Coltern. This old Crown-granted claim is situated about 1,500 feet north-east of the *Emma* mine and within half a mile of the Greenwood–Grand Forks wagon-road. The old shaft, 110 feet deep, was unwatered and retimbered and a drift driven 25 feet north, 60 feet down from the collar. The mineralized zone occurs in the limestone near its contact with greenstone and contains small lenses of chalcopyrite and pyrite in epidote and garnetite, averaging about 3 feet in width. To the south of the shaft an alkali-syenite dyke cuts the formation and probably disturbs the mineral-zone in that direction. This is a good formation for the deposition of copper ores and further development to the north seems worth while.

Lightning Peak Camp.

The developments in this camp are progressing favourably in spite of the short season and lack of capital by most of the claim-owners. A new discovery on the *Potosi* group is an added interest, bearing out the theory that the mineralized area follows around the foot of Lightning peak, where the igneous rocks are in contact with the sedimentaries. Future development of this camp should be watched carefully. If the vein on the *Waterloo* and *Potosi* claims which have the same strike, can be connected by development-pits the owners should have no trouble in interesting capital.

Waterloo. Assessment-work was done on the tunnel below the blacksmith's shop and a crosscut tunnel driven into the foot-wall, which developed a foot of ore hitherto undiscovered. In a formation of this character, limestone intruded by granite, the owners would do well to crosscut occasionally a few feet into both walls. This is a silver-lead property from which very high-grade ores were shipped from the surface. The lower zone seems to assay from $30 to $100 in silver and lead, which is too low grade to ship.

Potosi Group. This group of claims consists of the *Potosi*, *Potosi No. 4*, and *Silver Spot No. 4*. The owners, Jim Graham and Nelson, of Greenwood, turned the creek in the vicinity of the claims and sluiced off the gravel-wash, which was about 10 feet deep, resulting in the exposure of a vein about 8 feet wide in the limestone. The ore is silver, galena, and tetrahedrite in a gangue of calcite. This vein has the same strike as the *Waterloo* and possibly lies in the same fractured zone. The continuance of this lead will have to be proved by pits and open-cuts, which will take time as the wash is deep.

Lumpy.—A 30-foot tunnel was driven on this property by Walter Johnstone. Some good silver sulphides were encountered scattered through the limestone, but no definite lead developed. This claim lies in the same zone as the *Potosi*.

BOUNDARY DISTRICT.

GREENWOOD MINING DIVISION.

REPORT BY W. R. DEWDNEY, GOLD COMMISSIONER.

I have the honour to submit my annual report on mining operations in the Greenwood Mining Division for the year 1921.

NEAR GREENWOOD.

Providence.—This mine shipped 97 tons of first- and second-class ore to the Trail smelter during the year. The owners, the Providence Mining Company, Limited, have commenced to extend the development-work on the property.

Tam O'Shanter.—Owned by A. J. Morrison and Dan McGillis. The ore carries silver and gold. Development consisted of drifting 300 feet to strike the lead at depth and raising 75 feet to connect with a shaft. Ore has been struck at the bottom of the shaft where it meets the raise. A shipment is expected to be made at an early date. Indications are that this mine will soon be on the shipping-list.

Vendella.—The work done on this property during the year consisted of an inclined shaft 25 feet long; another shaft 30 feet deep; open-cut 20 feet long, 10 feet wide, and 15 feet high. The ore carries copper and gold. The future development of this property is looked forward to with great interest, as the work performed so far is most encouraging to the owners, Samuel Bombini *et al.* The Department of Mines has constructed a good trail to the mine and it is proposed to soon ship some ore for a trial test. About 80 tons of ore is on the dump ready for shipment.

WALLACE MOUNTAIN, NEAR BEAVERDELL.

Bell.—Operated by Duncan McIntosh and Pat Crane. Some 106½ tons of ore (mainly silver) was shipped to the Trail smelter during the year, containing 32,456 oz. silver, the total returns being $21,691. The average number of men employed was six. Two cars of ore are now ready for shipment. The development consisted of drifting 888 feet and raising 250 feet.

Wellington.—Sutherland & Thompson shipped 8 tons of ore to the Trail smelter that ran 247 oz. silver to the ton. Twenty-five feet of drifting was done on the lead and some overhead stoping.

Castor Fractional.—Sutherland & MacPhee shipped 2 tons of silver ore to the Trail smelter for treatment. They drifted on the lead 60 feet.

Revenge Group.—The owner, G. M. Barrett, opened up a crosscut on the lead 10 feet long and drove a tunnel 40 feet. He is getting out some very fine ore, but did not ship to the smelter during the year. An ore-bin 16 by 24 feet was built on the property.

Kokomo Fractional.—A 70-foot tunnel was driven on the claim and a shaft sunk 45 feet. Ten tons of good ore was shipped to the Trail smelter. The ore carries silver and lead.

Highland Lass.—This claim adjoins the *Bell* and is owned by I. H. Hallett and R. Smailes. The ore contains silver and gold, being similar to that of the *Bell.* J. McKellar has an option on the Smailes' half-interest. There is about 15 tons of ore on the dump ready for shipment.

Dayton Fractional and Doris Fractional.—The usual assessment-work was done on these claims with good results. On the *Dayton Fractional* a body of low-grade copper ore was uncovered 10 feet wide and running about $4.50 to the ton, all values. Not enough development-work has been done to determine the extent of the ore-body.

Riverside Group.—Situated about 3 miles above Rock Creek, on the east side of Kettle river, and owned by the Jack Paul Mining Company, with head office at Spokane, Wash. Two men were employed during the year. The ore carries silver, gold, and lead. F. Keffer, mining engineer, of Spokane, inspected this property recently, with the result that the company is going to drive a tunnel and employ more men.

Surprise No. 3.—Situated in Skylark camp and leased to Joseph Cunningham and Sartoine. The development consisted of a tunnel driven 60 feet long, sinking 25 feet, drifting 50 feet, and

an open-cut 100 feet long. A 2-foot vein was exposed, averaging about $100 to the ton, I am informed by Mr. Cunningham. The ore carries gold, silver, and lead.

Sally Group.—Average number of miners employed, 8; average number of others employed, 4.

Shipments: One car to the Northport smelter, 38.5 tons; four cars to the Trail smelter, 138 tons; total, 176.5 tons.

Values paid for: Gold, 1.161 oz.; silver, 56,284.09 oz.; lead, 23,685 lb.

Development: Drifting, 477 feet; crosscutting, 496 feet; raising, 33 feet.

Practically all the development-work was done on the *Rob Roy* and all the ore shipped was taken from this claim. The mine is in splendid condition, and the owners, the Wallace Mountain Mines, Limited, anticipate a larger output in 1922.

GRAND FORKS MINING DIVISION.

REPORT BY S. R. ALMOND, GOLD COMMISSIONER.

I have the honour to submit the annual return of the office statistics of the Grand Forks Mining Division for the year 1921, as below.

As the mining industry in this Division will be covered in the report of the Resident Mining Engineer for the Southern District (No. 4), there will be no need of a report on this head from the Gold Commissioner.

CENTRAL DISTRICT (No. 3).

VERNON AND ASHCROFT MINING DIVISIONS.

(Note.—The Resident Mining Engineer for these Divisions having been seriously ill and having since died, P. B. Freeland has made the following reports on certain properties in the Divisions.)

VERNON MINING DIVISION.

Properties examined by Philip B. Freeland, District No. 4.

Queen Group. This group, consisting of the *Queen* and *St. Claire* claims, is situated about 8 miles north-west of Vernon, on the west side of Okanagan lake, and is owned by McIntyre & Mabee, of Penticton and Kelowna. A good wagon-road has been built to the foot of the hill on which the claims lie. Development-work consists of numerous open-cuts, several shallow shafts from 10 to 20 feet deep, and trenching. Nearly all the work has been done where there is an indication of pyrrhotite. Most of the mineralization occurs in a highly metamorphosed sedimentary which has been fractured by the intrusion of a porphyry dyke outcropping about half a mile to the south from the workings. A good deal of copper-carbonate stain can be seen in the fractures on the surface and at the bottom of the shafts and open-cuts small lenses of chalcopyrite occur. The general strike of the fractures is north-east and south-west and covers an area of about 1,500 feet square. A general assay gave a trace in gold and silver and 1.70 per cent. copper. The gangue was silica, epidote, and some calcite. Needs more surface development before capital can be interested.

Falcon. Very little can be said about the possibilities of this claim because the examination was made when there was 6 inches of snow on the ground. The situation of the claim, about 2 miles north-west of Vernon and within three-quarters of a mile from a wagon-road, renders transportation easy. A shaft which had been sunk 40 feet was half filled with water and the open-cuts with snow. In the shaft a quartz lead varying from 6 to 14 inches was developed, showing segregations of arsenical iron chiefly near the collar. The strike of the lead is north and south (mag.) and the dip about 20° to the west.

A sample taken across the lead 18 feet below the collar of the shaft gave a trace of gold and silver to the ton. Another sample of white quartz, slightly oxidized in the fractures, gave 0.12 oz. in gold and 0.08 oz. in silver to the ton. The arsenical iron, with very little quartz present, gave 0.82 oz. in gold and 0.70 oz. in silver to the ton. The results of these samples clearly show that the values are in the iron or its oxides, and the future of the claim rests on the possibility of developing more of this mineral. Open-cuts to the north showed a continuance of the quartz.

Monashee, Morning Sun, McIntyre Group. A gentleman named F. S. Munson formed the Progressive Mining Company, of Vernon, with the intention of selling stock to the people of Vernon and vicinity and developing the above claims, situated about 48 miles east of Vernon. Practically all those who were working in connection with the property were asked to take stock in the venture as part payment for their labour. Work commenced in the autumn and log cabins built for bunk and cooking purposes on the *Morning Sun* claim. After stripping a quartz lead from 4 to 10 feet wide for about 100 feet a crosscut tunnel was started 125 feet below the outcrop and driven 40 feet, at the time of examination, in a highly altered volcanic tuff, slightly mineralized with pyritohedrons of iron. A sample across the quartz lead in one place gave 0.59 oz. in gold and 0.80 oz. in silver to the ton. The volcanic tuff gave 0.02 oz. in gold and 0.10 oz. in silver.

On the *McIntyre* claim, which adjoins the *Morning Sun*, the old open-cuts and tunnels have been cleaned out. Samples from the open-cuts and lead in the tunnels averaged 0.06 oz. in gold and 0.20 oz. in silver, which shows them to be too low grade at present for operation.

The mouth of the main tunnel on the *Monashee* claim was cleaned out and retimbered. This tunnel was driven 375 feet on the lead many years ago. Samples taken on the south side of the fault, over 150 feet of quartz lead (crushed) averaging 1 foot in width, gave an average

of $7 in gold to the ton. Beyond the fault the lead seemed to be barren as far as development had gone. An old stamp-mill built to concentrate the ore many years ago was in a delapidated condition. Two feet of snow on the ground prohibited a proper examination and little can be said of the possible future of this venture.

White Elephant, Early Sun, Lora Bell, Hill Top.

These claims are situated about 2 miles from Okanagan lake, on the west side, above Ewing's Landing, and are owned by Archie Clarke, Mrs. Clarke, Mrs. Saunders, and L. L. Stewart, of Okanagan Centre and Vernon. The discovery of a quartz-outcrop about 50 feet wide, containing free gold and bismuth, by A. Clarke created a good deal of excitement in local circles. The surface was stripped and a shallow shaft about 7 feet deep and several open-cuts were excavated. In the shaft the quartz was crushed and oxidized in the fractures, showing occasional films of free gold and generally in contact with bismuth. Samples of the quartz carrying the free gold naturally gave very high results, but they were not a true average of possible tonnage. Two samples taken across the side of the shaft where the mineralization was heaviest gave about $16 in gold to the ton, which seems to be more reliable. An open-cut 20 feet to the south of the shaft uncovered a body of pyrrhotite which assayed only a trace in gold. Other open-cuts carried only low values.

The presence of free gold in the quartz makes the property quite attractive, but before installing any plant for treatment of this ore it should be remembered that the past history of the vicinity records high-grade quartz bearing free gold to be of a "pockety" nature, which makes it advisable to develop the ore-body extensively first. The vicinity of the outcrop was covered with a heavy wash, and with so little development done even the strike of the ore was problematical at the time of examination.

The country-rock, where seen, was badly weathered, but resembled granodiorite. On the highest part of the hill remnants of limestone were found and above the outcrop to the south-west some alkali-syenite float. The location of the claim is good and transportation, by gravity to Okanagan lake, easy. There is plenty of timber for all purposes, but water is scarce.

ASHCROFT MINING DIVISION.

Kanaka Placers.

Kanaka bar is situated on the Kanaka Indian Reserve on the Fraser river about 9 miles south of Lytton, on the Canadian Pacific Railway. On the west side of the river the railway cuts along the side of a high gravel-bank. About 100 feet below the track a good deal of gold was placered in 1840. In and above these old grounds new interest has been taken by D. McKinnon *et al.*, of Grand Forks and Vancouver. Near the bottom of the bank and also on a false bed-rock good colours were obtained by panning, also a considerable amount of black sand carrying gold. It is the intention of the owners to try and save the values by special concentration, because the gold seems to be too fine for the ordinary methods. There are several million yards of gravel in the bank, and if good enough values can be obtained per yard the venture may be profitable.

Chu Chua Coal Co.—Portal.

Chu Chua Coal Co.—Bunkers.

UNIVERSITY OF ILLINOIS LIBRARY

LILLOOET DISTRICT.

LILLOOET MINING DIVISION.

Report by John Dunlop, Gold Commissioner.

I have the honour to submit the annual report on mining operations in the Lillooet Mining Division for the year ending December 31st, 1921.

Lode-mining in this Division being principally confined to the production of gold, I regret to report that the recovery of bullion during the past season has almost reached the vanishing-point. That disappointing statement in nowise detracts from the actual merits of the properties so operated and active, but emphasizes the continued unstable conditions and the inability of the gold-producing camp to continue production.

The *Pioneer* mine on Cadwallader creek, after being closed down about twelve months, was reopened by a Vancouver syndicate in the early part of the season. The work performed consisted of repairing tunnels and old workings and also the installation of a cyanide plant. Breakages in machinery and other unforeseen contingencies occurred at intervals, thus hindering the work and hampering the management.

At the *Lorne* mine, beyond work of an exploratory character and the extending of tunnels, no attempt was made to operate the stamp-mill on the premises.

At the *Wayside* and *Ida May* mines, and also the mineral locations on McGillivray creek, development-work was carried on and the veins extended, with a view to having those properties in a position favourable to successful operation when conditions improve.

During the past eighteen months considerable attention has been directed to the acquiring of placer-mining ground on the lower and upper reaches of Bridge river. On the former the work, consisting of wing-dams and sluicing, has been carried on with the object of testing the bed of the river. I understand that a company is formed to take over the greater part of the ground leased and to operate in a miner-like manner. So far the work done has been carefully directed.

Backed by English capital, the company owning the placer-mining leases in and around the Horseshoe Bend of the Bridge river has again resumed activity and has installed some of the latest mining machinery.

CLINTON MINING DIVISION.

REPORT BY G. MILBURN, GOLD COMMISSIONER.

I have the honour to submit the annual report of the Clinton Mining Division for the year ending December 31st, 1921.

A development of great interest, not only to the district but possibly of great importance to the whole Province, is the prospect of the ground in the neighbourhood of E. J. Taylor's *Windfall* mineral claim, situate in the Taseko or Whitewater River country, turning out to be as good as the claim in question is said to be. There are apparently three routes by which this territory may be reached. From Lillooet over snow-clad summits is the shortest way, but I believe it is almost, if not quite, impracticable until late in the spring. Two locators travelled this route back to Lillooet late in December and as a result of their work recorded some fifty claims.

The Public Works Department sent J. K. More, Road Engineer, to locate a road in continuation of one already built to a point within about 60 miles of the discovery. He succeeded in doing so and found that a wagon-road with reasonable grades can be made at a comparatively moderate cost. This road would be a continuation of the Chilcotin main road, which passes through Williams Lake, on the Pacific Great Eastern Railway. In addition to the two routes mentioned is another from Clinton by good roads through Kelly lake, Canoe creek, and Gang Ranch to a point some miles beyond Big creek, and thence by an existing pack-trail to the scene of the discovery.

I am informed that the valley in which the discovery was made by Mr. Taylor is some 25 miles long. Mr. More brought out samples of sand containing fine gold.

During the year of this report there have been about 150 mineral claims located in this portion of the Division and recorded in my office, most of them during the fall months. These recordings have been made in fair-sized blocks, the staking having been done by a few, acting as agents. About 100 more claims were staked in December and recorded in January, 1922.

The situation in regard to claims covering hydromagnesite-deposits is nearly the same as it was when I reported last year. On quite a number of claims payment of $100 in lieu of work has been recorded to keep the claims alive. These properties are unquestionably valuable and there is little doubt that a market will develop in time. Hydromagnesite is being shipped by way of the Pacific Great Eastern Railway at the siding at Exeter from the *White Empress* mineral claim, formerly owned by A. E. Carew-Gibson, but now in the hands of the Pacific Roofing Company, Limited, of Vancouver. Several large motor-trucks are being used to carry the commodity from the claim to the railway, and while I have no exact information I am informed that several car-loads have been shipped.

A large field of hydromagnesite lying north from Exeter for several miles as far as Township 12, Lillooet District, formerly staked in the year 1919, was restaked during June and the whole property now stands in the name of Kenneth Munro, of Vancouver. So far as I know, no work has been done on these claims, either to investigate or by way of assessment-work. I am informed that negotiations, which are likely to be successful, for the sale of the hydromagnesite-deposit on the Dougherty Ranch at Clinton are now going on. The Meadow Lake deposit referred to in previous reports, which is the largest and best discovered in this district, has not yet developed into a shipping proposition as was thought possible last year.

A good deal of activity has arisen in connection with the soda lakes and deposits. The Lillooet Soda Syndicate, Limited, with headquarters at Vancouver, employed a number of men under the direction of F. Silverton on their properties, the *Goodenough* and *Last Chance* Crown-granted claims, situate about 12 miles west from Chasm, north of Clinton. A considerable quantity of carbonate of soda was shipped, a ready market being found for all that can be extracted. It is expected that a much larger quantity will be shipped next year and preparations have been made to this end. Motor-trucks are employed to take the soda from the claims to the railway, a fair road being available for this traffic.

The Soda Mining and Products Company, Limited, holding a large number of Crown-granted mineral claims and ground covered by mineral records, has done little in the way of development or extraction this year, but, I understand, intend to put in a modern calciner when ready.

There are various other soda lakes chiefly held by the locators, who are awaiting an opportunity to turn them over to concerns who are looking for industrial chemicals. The

summer season was again dry and many of the lakes which were well covered with water now have soda crystals exposed.

A large deposit of gypsum near the railway at Kelly lake has been opened up by Leonard Burley and associates, and several car-loads have been sacked and shipped to Vancouver, in the vicinity of which place a market is being worked up among the agriculturists. The deposit in question is so situated that the gypsum can be put on the cars with the minimum of handling. A chute has been erected to a platform alongside the railway and the loading is done from that.

The magnesium-sulphate deposit has not been worked during the year, neither has any of that collected and stored on the shores of the lake been shipped. I am uninformed as to the intentions of the owners for the future. While a very considerable quantity has been taken from the lake, there is a vast amount still available and awaiting an accessible market.

Some prospecting has been carried on on the claims lying about 6 miles south of Clinton and assessment-work was recorded on a few of them. The results of the season's work do not appear to have been very encouraging, as attention was diverted to ground farther south in the vicinity of Maiden creek. There several claims were located and assays of the samples taken are regarded very optimistically by the owners, the returns showing the presence of gold, silver, and copper.

Placer-mining is much about the same as it has been for several years past. Although there are fewer placer claims in existence, the quantity of gold recovered is a little greater than last year, a total of approximately 250 oz. having been sent to the assay office. The whole of this gold was taken from the First North fork of Watson Bar creek. One placer claim was staked on Churn creek, but the locator informed me that the gold-bearing sands were very limited in area and the best he hoped for was a return a little exceeding wages.

One creek lease was issued during the year and there are now two mining leases on record. Both of these are on a branch of Watson Bar creek and I understand the auriferous gravels are fairly well covered. Development-work on both these leases has been done during the season and it is hoped gold will be recovered shortly.

The year was a fairly busy one in the matter of office records. Exactly twice as many mineral claims were recorded as compared with the year before. Certificates of work issued were a few less, but the number of bills of sale, etc., were very much greater. Revenue from free miners' certificates and from mining receipts (general) exceeded collections for the year 1920.

YALE DISTRICT.

NICOLA MINING DIVISON.

REPORT BY J. A. MURCHISON, MINING RECORDER.

I have the honour to submit herewith the annual report and office statisitcs of the Nicola Mining Division for the year ending December 31st, 1921.

Owing to the high cost of labour and the low price of metals, mining has not been vigorously prosecuted during the year 1921.

OFFICE STATISTICS—NICOLA MINING DIVISION.

Mineral claims recorded	43
Placer claims recorded	20
Free miners' certificates	128
Certificates of work	106
Bills of sale	10

VERNON MINING DIVISION.

REPORT BY L. NORRIS, GOLD COMMISSIONER.

I have the honour to submit the following annual report on the mining industry in the Vernon Mining Division for the year 1921:—

On March 30th last Archie Clark staked the *White Elephant* mineral claim on Shorts creek, on the west side of Okanagan lake, about 9 miles south-west from Okanagan Landing. Some very rich specimens of free-milling gold have been taken from it. It is now, I understand, under bond to American capitalists.

Some new claims were staked on Monashee mountain last summer. There was also considerable activity in a quiet way among the mines there.

On Cherry creek twelve placer leases were staked by the Cherry Creek Hydraulic, Limited. This company now controls fourteen leases on this creek. The construction of the ditch is pretty well advanced and the company will be able to commence sluicing as soon as the spring opens up.

There were also four placer leases staked on Whiteman creek by E. A. Keeley, H. T. Ross, S. Mercer, and H. A. Street, of Vancouver.

OFFICE STATISTICS—VERNON MINING DIVISION.

Placer leases	16

YALE MINING DIVISION.

REPORT BY H. BEECH, MINING RECORDER.

I have the honour to submit the annual mining report and office statistics for the year ending December 31st, 1921.

PLACER-MINING.

Placer claims on Siwash creek which were abandoned have again been restaked and active work has been carried on throughout the summer.

Lode-mining.

Development-work has proceeded steadily on most of the claims in the Yale Mining Division.

The *Emancipation* mine, bonded by the Liberator Mining Company, has opened up a large body of high-grade milling-ore above the old workings, and the company has employed from twenty to thirty men the last year putting in a cable-tramway and ore-bunkers. A stamp-mill is in course of erection.

The Spidel Peak properties in the same locality have been bonded and are being thoroughly prospected.

The *Eureka* group, 10 miles west of Hope, is being put into shape to prove the known ore-bodies.

The *Gisby* group at Keefers is being developed by the British Columbia Silica and Talc Company, of Vancouver, and will soon be in shape for production.

Office Statistics—Yale Mining Division.

Free miners' certificates issued	148

Bills of sale recorded	12

ASHCROFT MINING DIVISION.

Report by J. S. Alexander, Mining Recorder.

I have the honour to submit my annual report as Mining Recorder for the Ashcroft Mining Division for the year 1921.

A number of placer claims were staked in the vicinity of Spences Bridge, where a strike was made in March, and work is still progressing on these claims.

The annual assessment-work has been done on the majority of all the old claims.

A comprehensive report on mining conditions in this Division will, I understand, be made by the Resident Mining Engineer.

KAMLOOPS MINING DIVISION.

Report by E. Fisher, Gold Commissioner.

I have the honour to submit my annual report for the Kamloops Mining Division for the year ending December 31st, 1921.

With the exception of assessment-work, which has been well kept up, quartz-mining in this Division during the past year has again been practically at a standstill. The most important work has been done on the *Windpass* group, where a shaft 7 by 16 feet has been sunk to a depth of about 40 feet and a drift 7 by 10 feet run for a distance of 16 feet. The vein here is a replacement of the diorite country-rock by magnetite, feldspar, and a little calcite, with some free gold and gold telluride. The width of the vein has not yet been determined, as it is wider

than the present workings and will require crosscutting to prove the full width. Some 1,800 lb. of this ore shipped to the Trail smelter carried gold at the rate of $438 a ton. The vein looks strong and contains 3 to 4 feet of good ore, besides the low-grade stuff. Between 300 and 400 sacks of second-grade ore are at present being brought to Chu Chua for shipment to Trail; the values are practically all in gold, most of which is free. The difficulty at present with this property is its accessibility, but if the values continue as at present it would warrant the expenditure of the necessary capital to overcome this difficulty.

No mining has been done at the *Iron Mask* during the past year, but a force of men have been kept employed completing the overhauling of equipment and the installation of the pipe-line from the Thompson river to the mine. This latter, I understand, is now complete and working satisfactorily, and with an improvement in the price of copper it is expected that the mine will shortly be in active operation again.

There has been considerable activity in placer-mining, leases being taken up on 3-Mile creek, Louis creek, and North Thompson river. On 3-Mile creek the Jumbo Mining Company has built a flume from the dam 850 feet long by 2 by 1, with 200 feet of sluice-boxes. The company ground-sluiced a cut 100 feet long, 25 feet wide, and 7 feet deep, also sank a shaft 4 by 6 feet, 46 feet deep, and timbered it, but owing to water it was unable with the present equipment to reach bed-rock, but work will be continued next season.

Milton Roper has driven a tunnel 55 by 4 by 6 feet, sunk several prospect-holes, and made several open-cuts on the Roper lease. Mr. Cardon put in a line of sluice-boxes on his lease and with Mr. Roper sluiced a big open-cut. This showed good values in fine gold and work will be resumed in the spring.

MacKay & Boggs worked all the summer on their property, and on the Stevens & Mayville property a shaft was sunk and timbered 14 feet and several prospect-holes dug, in which good values were found. As a result of the showings on this creek it is anticipated there will be greater activity next season.

On Louis creek J. W. Smith built a considerable amount of flume in preparation for next season's work.

WESTERN DISTRICT (No. 6).

Report by Wm. M. Brewer, Resident Engineer.

INTRODUCTION.

The Western Mineral Survey District (No. 6) includes the seven most westerly Mining Divisions in the Province. These are Alberni, Clayoquot, Quatsino, Victoria, and Nanaimo on Vancouver and adjacent islands, and New Westminster and Vancouver on the Mainland.

As an introductory to the following annual report on the Western Mineral Survey District, the writer desires to express his appreciation for the several courtesies that have been extended to him during the past year, and to heartily thank each and every one of the men connected with the mining industry in his district with whom he has had business, as well as those from other districts whom he has met, for their many kindnesses and the ready assistance that have been universally extended to him.

TALKS TO PROSPECTORS.

Early in the past year the Hon. Wm. Sloan, Minister of Mines, decided on inaugurating a policy heretofore not followed in any of the Provinces in the Dominion or in any of the mining centres in the United States. In this connection he instructed the Resident Mining Engineer in each of the Mineral Survey Districts to prepare and deliver a course of addresses or talks to prospectors of an instructive and informative character on the rudiments of chemistry, mineralogy, and geology. The preparation and delivery of such talks was undertaken by the writer after having completed the annual report on his district. Between February 21st and April 22nd four talks were given in Victoria, Duncan, Nanaimo, and Alberni, and one in Cumberland, which were well received by audiences that increased in numbers.

After completing this work and owing to the serious illness of R. W. Thomson, Resident Engineer of the Central District, the writer was requested to visit Hope to carry out some examinations with regard to aiding prospectors in that section by constructing necessary roads and trails under the "Mines Development Act, 1916."

"IRON-ORE SUPPLY ACT, 1919."

From May 15th to June 1st mining, sacking, and shipping of about 22 tons of magnetite ore for experimental purposes from the *Lake* mine, on the west coast of Texada island, to Thos. Summerson & Sons, Limited, of Darlington, England, was carried out in accordance with the provisions of the "Iron-ore Supply Act, 1919." The shipment was made on the steamship "Spectator," which sailed from Vancouver about June 1st. Later in the year a smaller shipment of similar ore was made to W. Perrins, of Nanaimo.

EXAMINATION OF MINERAL CLAIMS.

Twenty-six groups of mineral claims were examined during the past year, reports on which will be found later in this report. The carrying-out of this work necessitated visiting Tatlayoko lake and Klinaklini river, in the northerly part of the Nanaimo Mining Division, on the Mainland; Texada, Lasqueti, and Quadra islands, Jump river, and upper Campbell lake, in the Nanaimo Mining Division; Indian and Stawamus rivers and Nelson island, in the Vancouver Mining Division; Koksilah and Leech rivers and Cowichan lake, in the Victoria Mining Division; also points on the west coast of Vancouver island, in the Alberni, Clayoquot, and Quatsino Mining Divisions.

DISASTERS.

During 1921 this district has been visited by two serious disasters, both of which occurred at the Britannia Mining and Smelting Company's beach camp, which, in addition to the depressed state of the copper market, are responsible for the fact that the production from the metalliferous mines of this district has been comparatively small. The production has been confined entirely to the shipment of 47,385 tons of copper ore from the *Britannia* mine, being partly the contents

of a storage-dump at Britannia Beach which had to be removed from the site selected for the new concentrating plant. This ore produced about 646 oz. gold, 7,943 oz. of silver, and nearly 1,411,376 lb. copper

The first disaster occurred on March 19th, 1921, when the concentrating-mill of the *Britannia* mine at Britannia Beach, which had a capacity to treat 2,100 tons of ore daily, was totally destroyed by fire. The second disaster, in which thirty-eight persons lost their lives and about twenty others were seriously injured, occurred on the night of October 28th, 1921, when more than half of the buildings in the town at Britannia Beach were destroyed by the high water in Britannia creek, which washed away a fill on the narrow-gauge electric railway connecting the beach with the 2,200-foot level in the *Britannia* mine, thereby causing a flood in the town.

These disasters are the most serious to visit any mining centre in the Province since 1915, when a snow and rock slide destroyed the old Britannia mining camp on the mountain-side at the foot of the Mammoth bluff on the 1,000-foot level at an elevation of about 3,200 feet above sea-level, which was the site of the first camp established by the original stakers of the *Jane* and *Fairview* mineral claims of the *Britannia* group in 1898. It is gratifying to state that the contracts are let for rebuilding the concentrating-mill with increased capacity, and that the town will also be rebuilt with as little delay as possible on a new site on higher ground well removed from the possibility of again suffering damage from a similar cause.

COAL-MINING.

The most important mineral industry on Vancouver island is coal-mining, which under normal conditions employs between 4,000 and 5,000 employees. During 1921 the gross production of coal on Vancouver island was 1,625,931 tons, compared with 1,698,254 tons during 1920, or a decrease of 72,323 tons.

All of the collieries are in the Nanaimo Mining Division, and these are the chief support of practically all of the towns on the east coast of Vancouver island northerly from Chemainus, which includes Ladysmith, Granby (formerly known as Cassidy), Extension, South Wellington, Nanaimo, Wellington, Lantzville, and Cumberland.

As the conditions of the collieries are reported on in detail in the Annual Report of the Minister of Mines by the staff of the Chief Inspector of Mines under the heading "Inspection of Mines," it is not the intention of the writer of this report to devote any space to such details, as they are outside of his own duties, but there are features regarding the coal-mining industry which do come within his proper sphere, and these are discussed as follows:—

The names of the companies, with the collieries they were actively operating during 1921, are as follows:—

Canadian Collieries (Dunsmuir), Limited, operating the Wellington-Extension Colliery, comprising Nos. 1, 2, and 3 mines at Extension and No. 5 mine at South Wellington, also Nos. 4, 5, and 7 mines, Comox Collieries, at Cumberland.

Western Fuel Corporation of Canada, a reorganization of the Canadian Western Fuel Company, operating the No. 1 or Esplanade shaft, Protection island, Harewood, Reserve, and Wakesiah mines, Nanaimo.

Granby Consolidated Mining, Smelting, and Power Company, operating the Granby No. 1 Colliery, Cassidy.

Nanoose Collieries Company, Limited, operating the Lantzville mine, about 10 miles northerly from Nanaimo.

King & Foster, lessees of the Old Wellington Colliery, operating the Adit mine at Wellington.

There is another company in the Nanaimo coalfield, known as the East Wellington Coal Company, which started to open the East Wellington Colliery in 1920, about 500 yards west from the old Jingle Pot mine, worked out during 1919, but this company has not yet commenced to produce any coal.

During 1921 the conditions of the coal-mining industry on Vancouver island have not been normal, because the demand for coal has been quite irregular and so much less than during the past few years that the miners in nearly all of the collieries have not been working full time, and some of the mines have been closed down for a considerable portion of the past year.

The importation of fuel-oil for locomotives and steam-vessels has, of course, had a very serious effect on the market for steam-coal; the effect has not only been the direct one of reducing the demand for coal, but the indirect one of sending hundreds of thousands of dollars

out of Canada in payment for oil and exchange. In an endeavour to offset these very undesirable conditions, experts are working to determine the possibility of substituting powdered coal in place of oil.

The demand for bunker coal for coal-burning steamers has been light owing to the general depressed condition of trade the world over, resulting in a decrease in the number of vessels carrying freight, and has also afforded those an opportunity to fill their bunkers, as well as some of the freight-holds, with sufficient Welsh and other coal at the foreign ports of clearance to furnish fuel for the entire voyage, outward and inward bound.

Another cause for the decreased demand for coal is the fact that a number of vessels have brought several thousands of tons of Welsh coal to San Francisco and Honolulu as ballast from ports in England and have loaded lumber for return cargo.

One of the most noticeable features relating to the coal-mining industry on Vancouver island is the harmonious relationship that exists between the operators and their employees, for which both classes are to be heartily congratulated.

Improvements in Coal-washer Plants.—Another is the lively interest that is at present being taken by the operators in improving the washery plants, and the methods that are to-day being employed to clean coal are not only of the most modern description, but in the experiments in oil-flotation that have been carried on during the past year by the Western Fuel Corporation of Canada; the Canadian Collieries (Dunsmuir), Limited.; and the Granby Consolidated Mining, Smelting, and Power Company, these companies are taking the lead on the North American continent.

Western Fuel Corporation of Canada.—In this connection the following brief description of the improvements being made in the washery plant of the Western Fuel Corporation of Canada at Nanaimo is interesting: The company assembles all of the coal produced at its various mines at a central point on the water-front in Nanaimo, where the bunkers, wharves, car-ferry slip, blacksmith, machine, and carpenter shops are located in the vicinity of No. 1 shaft, Esplanade, up which is hoisted the coal produced in that mine. The product from the Reserve, Harewood, and Wakesiah mines is transported to the central station on the water-front over the company's system of private railway-tracks.

John Hunt, the general manager of the Western Fuel Corporation of Canada, is entitled to much credit for the enterprise he has shown by authorizing the construction of the new washery plant, and especially for taking the lead in utilizing the oil-flotation process in the plant on a commercial scale. There are two main objects in making the improvements, and practically applying the science of concentration as employed in the metalliferous mines to coal-mining. These are: First, to produce the cleanest coal possible for the market; and, second, to make a product of commercial value from material that has heretofore been considered waste. The improvements as designed for the proposed new plant indicate an important stride along the road of progress. In the past coal-mines generally have been equipped with washery plants in which the Robinson cone washers were used, and it has been customary on Vancouver island to treat the residue from the washer by passing it through jigs and over concentrating-tables in order to clean the smaller sizes of coal, such as pea and nut, but no serious effort has heretofore been made to further concentrate the slack and sludge, which have gone to waste-dumps or been deposited in the sea.

The plant which is under construction and the machinery for which is all purchased is expected to be in operation during the coming summer; it is designed by P. E. Peterson, one of the pioneer operators in concentrating by the oil-flotation method and inventor of the Peterson cell, which has to a great extent supplanted the Callow and other cells heretofore used in oil-flotation.

The flow-sheet as illustrated in the accompanying plan shows an absence of intricate construction not often found in connection with such works; indeed, the whole scheme is so simple that two men, or one man and a boy, on a shift will comprise all the labour necessary to operate the plant. This plant will be used in addition to the present washery, in which jigs have been discarded and four Deister coal-concentrating tables substituted.

A reference to the flow-sheet shows the two sources from which the product to be treated is drawn—one a refuse-dump on the upper left-hand corner of the plan; the other, refuse from the picking-tables in the present washery, delivered on the upper floor of the new plant in railway-cars, as shown on the upper right-hand corner of the plan. The material in the refuse-dumps is

carried into the plant by a paddle-conveyor, which delivers it on to a trommel-screen; the oversize passes from the trommel by gravity down a launder to an 8-foot Hardinge ball-mill; the undersize passes by gravity into a screw-classifier, the oversize from which passes by gravity on to two Diester coal-concentrating tables. These tables produce three products—viz., coal, middlings, and rock. The undersize or overflow from the screw-classifier is carried by gravity to a battery of six Peterson flotation-cells; the product from two of these cells is clean coal and from the other four middlings. The coal from the flotation-cells passes by gravity into a settling-tank 30 feet in diameter, from which the dewatered fine coal passes to a paddle-conveyor, by which it is carried to railway-cars ready for market. The middlings from the flotation-cells pass by gravity along a launder to a bucket elevator near the ball-mill, into which the overflow water from the settling-tank is also discharged. The bucket elevator discharges into a launder, along which the material passes by gravity on to the trommel-screen already mentioned and is subjected to the same series of treatments as has just been described. The coal and middlings concentrates made on the Deister tables are carried by gravity to a second screw-classifier near the settling-tank, so that the overflow from the classifier can discharge into the settling-tank, while the fine dewatered coal is carried to the paddle-conveyor, which delivers it into railway-cars ready for market. The refuse brought in railway-cars from the picking-tables below the main tipple is dumped into a bin below the track and from there goes into a Blake crusher, which discharges into the Hardinge ball-mill.

One of the advantages to be gained by the treatment described of the slack or refuse is that the coal can be more thoroughly picked over on the picking-tables and a cleaner product made, because practically all of the carbon in the refuse is later saved in the concentrating-washer. Heretofore many lumps of coal with which was associated only a small percentage of rock were allowed to pass to market, but in the future all of such material will be discarded at the picking-tables to be treated by concentration.

Canadian Collieries (Dunsmuir), Limited—Comox Mines.—The washery plant for the Comox mines is at Union Bay, where the product from those mines is assembled for water shipment from the large bunkers at the wharves. The coal is transported from the mines over the company's private railway, a distance of about 14 miles. The washery is fully equipped with Robinson cone coal-washers and ten Masco coal-concentrating tables. The company has during the past year been experimenting with oil-flotation, and forwarded some car-load lots to the Mineral Separation Company at San Francisco, as well as putting in a small experimental laboratory plant at Union Bay, but has not as yet adopted the treatment on a commercial scale.

The following is a brief description of the improvements made on the surface during 1921:—

Extensive repairs were carried out on the flume of the hydro-electric plant. The large area covered by the underground operations at No. 4 mine, Comox, has for some time been taxing the ventilating facilities at that mine. In October of the present year operations were started to install a second fan, and with the new installation completed, the Nos. 1 and 2 slopes of this mine will be ventilated each by a separate ventilation unit.

The present unit consists of a Sullivan double-inlet fan, having a capacity of 180,000 cubic feet a minute, against a 6-inch water-gauge. The fan is electrically driven by a 350-horse-power induction-motor, 2,200 volts, speed 250 r.p.m., directly connected to the fan-shaft. This fan will in future ventilate the workings of No. 2 slope, while the new installation will take care of the workings of No. 1 slope.

The new unit is situated just west of the travelling-way, and in order to make room for the installation extensive changes were made in the railway-yard, which not only increased the capacity, but added much to the efficiency and appearance of the whole plant.

The new fan plant consists of a 108-inch double-inlet reversible Sirocco fan on concrete base with half-housing in steel. The fan will be connected to the mine by a reinforced-concrete tunnel fully equipped with explosion-doors. The fan will run at 250 r.p.m. and will deliver 200,000 cubic feet of air a minute, against a 6-inch water-gauge.

The primary power unit will be a 500-horse-power synchronous motor, 2,200 volts, equipped with a self-starting unit; the motor will run at 500 r.p.m., connected to the main shaft of the fan through a jack-shaft with silent chain-drive in two sections, each 15 inches wide, the ratio between the motor and fan speed being 2 to 1; the distance between centres of drives will be 106 inches.

In addition to the primary drive, there will be carried as an emergency unit a 350-horse-power induction-motor, speed 250 r.p.m., which can be connected by a coupling direct to the main fan-shaft. This induction-motor is a duplicate of the motor now in use on the present ventilation units at No. 4 mine and also at Nos. 5 and 6 mines, and can in emergencies be used on any one of the three units.

The power unit will be housed in a fire-proof concrete building with asbestos roofing, and, in all, makes one of the most complete and efficient ventilating plants in the Province.

Diamond-drilling.—During the year diamond-drilling was continuously prosecuted in the Tsable and Cumberland fields. Much of the time three drills were in operation; one was withdrawn in October and transferred to the Ladysmith district.

In the Tsable River district, to the 115,220 feet of roads made to facilitate movement of drills and 15,051 feet of holes drilled during 1919 and 1920, there was added in 1921 12,900 feet of roads and 6,991.6 feet of drilling; all of this drilling gave a 2-inch core. In the Cumberland district 12,300 feet of roads were made to facilitate movement of the drills and 3,370 feet of holes drilled; making a total for the year in the Comox field of 25,200 feet of roads made and 10,361 feet of holes drilled.

The operations of the Canadian Collieries (Dunsmuir), Limited, in the Extension and South Wellington fields, Nanaimo Mining Division, have been carried on satisfactorily during 1921. The production of coal from the company's mines in those fields shows an increase during the past year of 10,253 tons.

Systematic prospecting with diamond-drills has been carried on in two sections of the coalfield—Haslam flat, Oyster district, a few miles southerly from Cassidy; also near the Nanaimo river, Cranberry district. This prospecting is on the Wellington coal-seam, the deepest of the three seams in the Nanaimo field.

Three boreholes have been put down on Haslam flat; two of these are 1,500 feet deep and the third is 900 feet. Good coal of workable thickness has been exposed, but the prospecting has not yet been sufficient to warrant opening a new mine.

About 300 feet of drilling has been done near the Nanaimo river, in the Cranberry district, on the line of the company's private railway from Extension to Ladysmith.

At South Wellington No. 5 mine two rock tunnels are being driven to the south off the Main slope a distance of 2,500 feet, which are expected to develop a large area of good coal.

At Ladysmith, where all of the coal produced at the Wellington-Extension and South Wellington Collieries is assembled for shipment, improvements have been made in the washery plant which have resulted in the recovery of a larger percentage of pea coal than in the past. These improvements comprise the erection of a shaker screen, automatic water-feed, and settling-tank as auxiliaries to the three Masco coal-concentrating tables in use for some time past.

Granby No. 1 Colliery, Cassidy.—During 1921 R. R. Wilson, who has been superintendent for the Granby Company at the colliery since 1919, resigned, and was succeeded by E. E. Campbell, who had been connected with the Granby Company at Phoenix since 1900 and was mine manager for several years. Under the management of R. R. Wilson the colliery at Cassidy was placed on a shipping basis, the production being increased from 72,885 tons in 1919 to 268,962 tons in 1921.

The title of the Granby Company to the coal rights under areas of land near Cassidy acquired in 1917 from original settlers on the Esquimalt & Nanaimo Railway Company's land belt was confirmed by the Privy Council in November last. This decision settles the litigation that has been pending since 1917, when the Granby Company purchased the property on which it has opened the coal-mine known as the Granby No. 1 Colliery and built a model town for its employees, with all modern conveniences, recreation-grounds, club-house, shower-bath house, change-rooms, etc.

During 1921 this colliery produced 268,962 tons of coal, as compared with 201,589 tons in 1920. The coal-mine is operated primarily to supply coal for manufacture into coke in the battery of by-product coke-ovens at Anyox for fuel for the company's copper blast-furnaces at that point, about 600 miles up the Mainland Coast from the Granby No. 1 Colliery.

During 1921 experiments have been carried on with a view to improving the methods of further cleaning the sludge, which at present passes off from the Diester-Overstrom tables in the washery plant as waste. It was at this colliery that the first successful attempt to apply the oil-flotation method of concentration to coal was made by P. E. Peterson in the spring of 1921.

The object desired to be attained was to reduce the content of ash in the slack coal used for the manufacture of coke to that point where it would not exceed 15 per cent. ash as it came from the washer, and it was found to be possible by oil-flotation to clean such material, after it had been ground fine, so thoroughly that a product carrying as low as 15 per cent. ash was saved, the proportion being sufficiently great to result in profitable operations on a commercial basis.

Old Wellington Colliery.—King & Foster, the lessees of this coal-mine, have worked continuously during 1921 on a limited scale, owing chiefly to lack of capital to branch out. The The lessees are successfully attempting to reopen the mine and pay for the operations from the income received from the product. Most of the work has been the drawing of old pillars, and they are succeeding in this attempt, the product being gradually increased to a point where it is beginning to be of importance.

The coal is of excellent quality. This is the original mine operated so successfully by Hon. Robert Dunsmuir before he built the Esquimalt & Nanaimo Railway, and when the bulk of the production was shipped from Departure bay to San Francisco by sea.

Pacific Coast Coal Mines, Ltd.—This company not only did not operate during 1921, but all of its property, including the Morden coal-mine near South Wellington and the Suquash coal-mine in the north-eastern portion of Vancouver island, as well as all equipment, was sold at Sheriff's sale and purchased by Montreal interests.

Nanoose Collieries Co., Ltd.—This company increased its production from the Lantzville mine, about 10 miles north-westerly from Nanaimo, from 32,500 tons of coal in 1920 to 55,942 tons in 1921. The company ships all of its output by water, and is considerably handicapped during stormy weather, because there is practically no shelter for vessels at the company's wharf.

East Wellington Colliery.—This colliery has not yet become a producer of coal. John John, the mine manager, has been occupied in completing the erection of the necessary buildings and installing the machinery on the surface, in order to be prepared to take advantage of better market conditions by having the mine in shape to commence production when such is warranted by the demand. The coal from this colliery when production begins will be shipped over the same railway-track as was the case when the old Jingle Pot mine was being operated, from which the coal was delivered to scows and vessels from the wharf not far from the old gaol on the Nanaimo water-front.

METALLIFEROUS MINING.

The concentrating-mill at Britannia was closed down on November 30th, 1920, and the mill at the *Indian Chief* mine, Sidney inlet, west coast of Vancouver island, was also closed down about the same time, while production at the *Marble Bay* mine, Texada island, ceased during 1920. These were the only producing metalliferous mines in the Western Mineral Survey District, and no others were added to the list during 1921, consequently when considered from a production basis the condition of the metalliferous mineral industry in this district during 1921 has been discouraging. On the other hand, however, when the results from development-work and prospecting that have been carried on during the year in various sections of the district are considered, there is every reason for a feeling of optimism to prevail with regard to the future condition of the industry.

During 1921 several mining engineers were in the district searching for prospects that might be attractive to their principals.

Prospecting.—The Consolidated Mining and Smelting Company of Canada has had parties of mining engineers engaged in field-work prospecting the section of Vancouver island known as the Esquimalt & Nanaimo Railway Belt, but no results from that work have been made public. This examination was made by the smelting company at the request of the Esquimalt & Nanaimo Railway Company, and in accordance with an agreement entered into by the railway company with the Honourable Minister of Mines, in an effort to consummate some arrangements by which the present dual control of the minerals in the Railway Belt can be eliminated. At present the Esquimalt & Nanaimo Railway Company is the owner of all coal and base metals occurring within the boundaries of the Railway Belt, while the title to any precious metals occurring within the belt is in the Crown.

The prospecting-work done by these parties has been confined almost entirely to the Nanaimo Mining Division.

In the Quatsino Mining Division, Wm. Clancy, manager of the *Old Sport* mine, owned by the Consolidated Mining and Smelting Company of Canada, has been occupying much time in prospecting and making a detailed geological survey of the mountainous country in the vicinity of the *Old Sport* mine in an endeavour to determine more fully than is at present known the extent, structure, and geologic conditions of several ore-deposits that occur in the north-westerly portion of Vancouver island.

Development-work on the *Old Sport* has been suspended awaiting the erection of a concentrating plant on that property, which construction was a part of the programme proposed to be carried out in 1920, but was postponed owing to the high costs for building and difficulties in procuring machinery for the plant, as well as the demoralized condition of the copper market.

Prospecting generally in the Western Mineral Survey District has been carried on in some sections with more energy than for some years past, but this work, so far as Vancouver island is concerned, has been principally confined to further search for gold-bearing quartz and ores in the neighbourhood of Kennedy lake and in the Beaufort range of mountains, on the westerly slopes, where veins of gold-bearing quartz were discovered about 1898, but under the conditions prevailing at that time were considered to be too narrow to permit of being worked on a commercial scale. On the Mainland portion of the Western District there has also been a tendency to confine prospecting to a search for gold rather than copper or silver ores; consequently the Fire Mountain section near the head of Harrison lake has received some attention from prospectors during 1921.

The Coast range on the Mainland is apparently becoming a more attractive field for prospectors than in the past. Several occurrences of fair-grade ore in the altered sedimentaries which are found as undestroyed roof-pendants intruded by the Coast Range granodiorite batholith have been discovered during the past two or three years. Most of these have been examined and some are reported on later in this report. One feature especially with regard to these deposits is worthy of mention. It is that they are almost universally found to occur at high altitudes and isolated. They are only found as the result of intensive prospecting on and near the summits of the mountains and usually close to or above the timber-line. Many of such deposits have been first discovered by energetic men who associate big-game hunting and trapping with prospecting.

ALBERNI MINING DIVISION.

There has been but little activity in mining in the Alberni Mining Division during 1921. The annual assessment-work has been generally done on the mineral claims not Crown-granted, but no serious attempt to extend development-work has been made. Mining engineers from San Francisco and other centres have examined several of the older mineral claims for their principals, but to date there has been no advice that any properties have been bonded.

During the past summer, E. F. Eastman, managing director of the Tacoma Steel Company, accompanied by E. Stephens, general superintendent, examined several iron-ore claims at and near Sechart, near the western channel of Barkley sound. These claims are all Crown-granted and owned by the Tacoma Steel Company. No results of the examination were made public. The claims were reported on in the Annual Report of the Minister of Mines for 1916.

The *Big I.* group of mineral claims on Big Interior mountain, at the head of Drinkwater river, 10 miles from the head of Great Central lake, which were bonded to the Consolidated Mining and Smelting Company of Canada in 1919, reverted to the original owners during 1921.

As reports have been published in the past Annual Reports of the Minister of Mines on the majority of the mineral claims in the Alberni Mining Division, it is unnecessary to repeat in this present report. For that reason the following two reports only are included. These are on groups of mineral claims which were examined during 1921, but have not been reported on for some years. These are the *W.W.W.* and the *Gretna Green* groups.

W.W.W. Group. This group of mineral claims is in the southern portion of Vancouver island, near the heads of China and Granite creeks and the Franklin river, which was brought into considerable prominence about 1899 by the discovery of quartz veins carrying good gold values, with much of the quartz showing particles of free gold visible to the naked eye. The *W.W.W.* group was more thoroughly prospected by the locators

than any other claims, and was eventually sold to Wm. Harris, of Spokane, one of the original owners in the *Le Roi* mine at Rossland. After operating for about two years work was stopped. Since then, except during a short period in 1908, the section has received no attention until about October, 1921. During 1920 the *W.W.W.* group was advertised at tax sale and was purchased by H. Davie, of Port Alberni, who in due course received title from the Government, and later sold to R. G. McLeod, of the McLeod-Slocan Mining Syndicate, Limited, Vancouver. The present owner proposes to reopen the old workings on the claims, extend the development-work, and operate on a commercial scale by erecting a small milling and concentrating plant.

Area and Title.—The *W.W.W.* group contains four Crown-granted mineral claims known as the *W.W.W. Nos. 1, 2, 3,* and *4,* comprising approximately 200 acres. A bond has recently been taken by R. G. McLeod, of Vancouver, from H. Davie, of Port Alberni.

Geography.—The *W.W.W.* group of mineral claims is in the Alberni Mining Division near the headwaters of Franklin river, which has its source in the Beaufort range of mountains, no great distance from Mount Arrowsmith, the highest peak in the southern portion of Vancouver island. The Franklin river empties into the Alberni canal on the east side, about 10 miles southerly from Port Alberni, the head of navigation for ocean-going vessels. The *W.W.W.* group is reached by travelling an old pack-trail in an easterly direction from near the mouth of the Franklin river for a distance of about 12 miles.

Geology.—The *W.W.W.* group is in that portion of Vancouver island the geology of which is described in Memoir No. 13, Southern Vancouver Island, by Chas. H. Clapp, Canada Department of Mines, Geological Survey Branch, 1912. Clapp in his report merely refers to the section in which the *W.W.W.* group is situated, as follows: "A large number of claims have been staked on a group of deposits near the headwaters of Franklin river and China creek, in the Alberni, Dunsmuir, and Barkley districts. These claims were not visited, so that their character is not known. Some of them may be contact deposits, but it is probable that they are chiefly impregnated and partially replaced shear-zones."

On the map accompanying Clapp's report the section is shown as being made up of rocks classified as Saanich granodiorite and Vancouver volcanics, with the first named occurring along the east shore of Alberni canal, in the vicinity of the mouth of Franklin river, and extending south-easterly about 12 miles with the contact occurring between the Saanich granodiorite and the Vancouver volcanics at a point about 6 miles up the Franklin river. The area covered by the volcanics is apparently quite extensive, but undetermined.

The writer of this report is of the opinion that the country-rock surrounding the *W.W.W.* group of mineral claims belongs to the Vancouver Volcanic series.

Ore-deposits.—There is a well-defined vein-structure in a shear-zone on the *W.W.W.* group. The ore is deposited in fissures which have clean-cut walls, but vary considerably in width from a few inches up to 14 inches. There is gouge on each wall and the vein-filler is made up almost entirely of quartz mineralized with iron pyrite and some free gold.

There are apparently two fissures, or possibly a linked-vein system in a shear-zone in which the links or lenses of mineralized quartz occur *en echelon,* with a structure somewhat similar to the shingles on the roof of a building. The strike of each of the fissures is S. 10° W. (mag.) and dip about 45° towards east.

In the upper adit as shown at present the length of the pay-shoot in the vein, of sufficient width to be considered workable, or exceeding 12 inches, is approximately 30 feet, but the fissure is continuous, though in places much narrower for 72 feet, the full length of the adit. At the face the values in gold are high, with some indications that the vein may widen out.

In the lower adit, which is 117 feet long, the pay-shoot in the workable part of the vein is about 40 feet long, but the fissure is continuous the entire length of the adit. There is a stope 33 feet long and about 20 feet high from the lower adit, also a winze of unknown depth, being full of water. The stope is about 60 feet from the portal of the adit and extends to within 16 feet of the face. The winze is sunk across the adit from the stope.

Some shipments of high-grade ore were packed out on horses, and which were made about 1900 to the Tacoma smelter, were presumably mined from the stope and winze in the lower adit, as well as from the drift-adit.

Samples and Assays.—Three samples were taken during the examination, which assayed as follows:—No. 1, from 6 feet from the face and up to the face of the lower adit, quartz about 6 inches wide, assayed: Gold, 0.24 oz.; silver, 0.16 oz.; copper, trace. No 2, from face of upper

adit, quartz 6 inches wide, assayed: Gold, 5 oz.; silver, 4.5 oz.; copper, 0.3 per cent. No. 3, selected samples of decomposed quartz from near the portal of the upper adit above the roof, assayed: Gold, 14.84 oz.; silver, 8 oz.; copper, trace.

The above-mentioned samples do not represent the average value of the vein in either adit, as no attempt to determine the average value was made; the places from which the samples were taken were selected at haphazard, except No. 3 sample, which was selected to show the values carried by the decomposed quartz at that particular point.

Following is a list of assays made from samples taken by the owner at various times and is reproduced here merely as an illustration:—

Copies of Assays made on Samples of Ore from W.W.W. Group.—P. W. Thomas, Provincial Assayer: Decomposed ore—Gold, 6.42 oz., $128.40; silver, 6.04 oz., $3.92; total, $132.32. Arsenical ore—Gold, 4.90 oz., $98; silver, 3.72 oz., $2.42; total, $100.42.

West Assay Works, October 14th, 1921: Gold, 4.65 oz., $93; silver, 6.34 oz., $4.57; total, $97.57.

Consolidated Mining and Smelting Company: Gold, 2.90 oz.; silver, 2.07 oz.; lead, 4.09 oz.

Tacoma smelter: Gold, 5.58 oz.; silver, 4.20 oz.; total, $111.60.

J. R. Williams, Provincial Assayer and Chemist, 621 Pender Street West, Vancouver, October 27th, 1921: Sample No. 1, gold, 21.16 oz., $423.20. Sample No. 2, gold, 7.92 oz., $148.40. Sample No. 3, gold, 10.44 oz., $208.80; silver, 6.96 oz., $4.87; total, $213.67.

J. R. Williams, October 31st, 1921: Amalgamation test—Average of three assays, $261.75; amount of free gold, $120.

Development-work.—The development-work on the *W.W.W.* group consists of two adits, each one driven as a drift following the strike of the vein system from the surface outcrops in the side of a mountain at an elevation of about 2,000 feet above sea-level. The lower of these adits is 117 feet long. At a point about 60 feet from the portal a stope has been opened, which is 33 feet long; there is also a winze of unknown depth sunk on the opposite side of the adit from the stope. The upper adit is 72 feet long.

There is an ample supply of water near by the mine-workings for power and concentrating purposes, which can be developed at a comparatively low cost.

Gretna Green Group.

This group of mineral claims, at the head of Henderson lake, is in the interior of Vancouver island from the west coast, and is not described in either of the Summary Reports, 1919 or 1920, Geological Survey, Canada, by V. Dolmage in his notes on "Barkley Sound" and "West Coast, Vancouver Island, between Barkley and Quatsino Sounds," and, so far as the writer knows, no detailed examination of the geology of the section has been made, nor have prospectors explored the interior any considerable distance from the shores of Barkley sound or Alberni canal. The large number of islands, length and irregularity of the shore-line, has offered advantageous opportunities to explore the shore-lines, while the dense underbrush, almost impenetrable forests, and rugged mountains, which usually rise almost perpendicularly from the shores, have retarded prospecting to any considerable distance into the interior. For these reasons there is a very large area in that section of the interior from the west coast of Vancouver island, extending in a north-westerly direction from Uchucklesit harbour near the entrance to Alberni canal to near Quatsino sound, that has never been explored by white men.

Considerable interest was shown about 1898 and 1899 by prospectors along the shores of Uchucklesit harbour, Snug basin, and Henderson lake, but the rapids between the harbour and lake presented a transportation problem which to a prospector, or even a company with limited capital, appeared almost insurmountable; consequently, during the past twenty-two years but little attention has been paid to that section.

Outcroppings of high-grade copper ore in contact-metamorphic deposits occur in several places near the shore-line of Uchucklesit harbour, Snug basin, and near the head of Henderson lake, one of which is on the *Gretna Green* group, but no really extensive systematic prospecting with the view of attempting serious development-work has been done, principally for the reason that the occurrences of ore were usually in kidneys and so irregular as to discourage operators.

Area and Title.—The *Gretna Green* group contains four mineral claims owned by George Brown, of Vancouver.

Geography.—The *Gretna Green* group of mineral claims is about a mile northerly from the fish-hatchery at the head of Henderson lake, which is about 12 miles long and empties into

Tidewater Copper Co.—Mine Buildings.

Emancipation Mine—Liberator Mining Co.

UNIVERSITY OF ILLINOIS LIBRARY

Uchucklesit harbour through a series of rapids. Uchucklesit harbour is an arm of Barkley sound on its north side at the entrance to Alberni canal. Uchucklesit harbour, in connection with Snug cove at the north-westerly end of the harbour, affords one of the best and most commodious shelters for vessels of any draught on the west coast of Vancouver island.

Geology.—On the *Gretna Green* group there occurs a highly metamorphosed zone with a contact between limestone and a rock resembling diorite, associated with which contact there occurs masses of such contact-metamorphic rocks as garnet and epidote. In the belt of limestone there are several cliffs which rise above the normal level to elevations of from 100 to several hundred feet. These cliffs are usually quite precipitous, and at the contact with the igneous rock there are usually narrow canyons and watercourses resulting from erosion. The contacts are generally well defined, but in some instances the metamorphism has been so pronounced that the point of actual contact is hidden and difficult to determine with certainty.

Ore-deposits.—At a point about 100 feet higher elevation than Henderson lake, near the easterly bank of a creek, there is a prominent cliff of limestone, and apparently near the contact between it and an igneous rock resembling diorite there occurs an outcropping of exceedingly high-grade copper-sulphide ore, more or less associated with contact-metamorphic minerals. The ore appears to have replaced limestone, as the best ore is more often found in kidneys and bunches, surrounded on all sides by limestone almost crystallized to marble, rather than in association with the contact-metamorphic minerals, but it is noticeable that unless some garnet or epidote occurs near by there is as a rule no copper ore.

The condition of the ore-deposit and surrounding country-rock is such that, although the ore is exceptionally high grade, the indications appear to show that the quantity is so limited, its occurrence so erratic and irregular, as to suggest that, while further and systematic prospecting may result in exposing more favourable conditions, it must be regarded in the light of a possibility rather than a probability, but is an absolute necessity before any value can be estimated for the *Gretna Green* group of claims.

Samples and Assay.—One selected sample was taken from about 100 lb. of ore, all that was exposed, which assayed: Gold, 1.4 oz.; silver, 1.5 oz.; copper, 17.8 per cent.

Development-work.—No work other than some prospect-holes could be found, and Nature's handiwork was more noticeable than man's in excavating these holes.

CLAYOQUOT MINING DIVISION.

During the summer of 1920 a geological survey of the west coast of Vancouver island between Barkley and Quatsino sounds was made by V. Dolmage, and his summary report is published in Summary Report, 1920, Part A, Canada Department of Mines, Geological Survey. In the beginning of Dolmage's report, under the heading "General Description," he says: "The coast between Barkley and Quatsino sounds, consisting, as it does, of three large sounds with numerous inlets and islands, among which may be found many excellent harbours, is the most irregular part of the west coast of Vancouver island. It differs markedly from the rest of the west coast, which is so straight and regular that it offers almost no protection to coasting vessels. The shore, in general, is bold and rocky and sparsely timbered with stunted conifers; but in a few places, such as Estevan point and in the vicinity of Wreck and Long bays, extensive sandy and bouldery beaches are developed at the base of low perpendicular cliffs. This part of the island is thinly populated, chiefly by Indians of a most primitive type; a few white people are engaged in fishing and canning and to a slight extent in mining, lumbering, and ranching. The only means of communication is by the Canadian Pacific Railway steamer 'Princess Maquinna,' which makes the round trip from Victoria to Quatsino three times each month."

Under the heading "Geology" he gives the following table:—

"The following table of formations summarizes the geology of this part of Vancouver island:—

"TABLE OF FORMATIONS.

Age.	Formation.	Character.
Recent		Stream and river gravels.
	"Unconformity.	
Pleistocene	Wreck Bay formation	Stratified sands, gravels, and clays.
Lower Cretaceous or Upper Jurassic	Cretaceous sediments	Sandstone and conglomerate.
Jurassic	Coast Range batholith	Granodiorite, quartz diorite, diorite.
	"Intrusive.	
Triassic	Vancouver group	Andesites, tuffs, tufaceous argillites, and limestones."

As this Summary Report can be obtained on application to the British Columbia Branch of the Geological Survey at 510, Pacific Building, Vancouver, it is not necessary to quote further extracts at this time. Reports on all of the mineral claims described by Dolmage have been published from time to time in the Annual Reports of the Minister of Mines, and as there is practically no dissimilarity in the descriptions it is not considered essential to repeat the report here.

During a portion of the month of September and early part of October the writer visited the west coast of Vancouver island, and amongst the claims examined are the *You*, *White*, and *Wanderer* groups of mineral claims, reports on which follow:—

You Group. This group of mineral claims is in the most rugged part of the Beaufort range of mountains, near the southern boundary of Strathcona Park and not far from the centre of Vancouver island. The district has received a good deal of attention by prospectors since 1899, when Joe Drinkwater crossed the island from Bedwell river to Great Central Lake, discovered copper-sulphide ore, and staked the *Big Interior* group of mineral claims. The occurrence of persistent but narrow quartz veins carrying values in gold and silver higher than is usually found on Vancouver island made the district attractive to prospectors. The lack of transportation facilities, comparatively inaccessible situation, low grade of the copper ores, and expense of prospecting and developing these low-grade but extensive bodies have retarded the progress of the mining endeavor in this section of Vancouver island.

No reports have been made by the Geological Survey of Canada relative to the geology of that part of the interior of Vancouver island in which the *You* group of mineral claims is situated. Victor Dolmage, in the Summary Report, Canada Department of Mines, Geological Survey for 1918, described the geology of Quatsino sound; in the Summary Report for 1919 he described the geology of Barkley sound; and in the Summary Report for 1920 he describes the geology of the west coast of Vancouver island between Barkley and Quatsino sounds.

Area and Title.—The *You* group contains four mineral claims and occupies an area of approximately 200 acres. The owner is J. B. Woodworth, of Thorley Park, Vancouver.

Geography.—The *You* group of mineral claims is near the centre of Vancouver island, in the Clayoquot Mining Division, on the westerly slope of the Beaufort range of mountains at an elevation of about 3,000 feet above sea-level. The property can be reached either from Alberni via Great Central lake and Bear pass or from Clayoquot by launch to the head of Bedwell sound, from which point it is about 13 miles to the claims over a wagon-road for a distance of 9 miles and a pack-trail the remainder. The route from Clayoquot is usually travelled and is the only route by which supplies or machinery can be transported. By the Great Central Lake route men must pack on their backs across one of the highest and most rugged mountain ranges on

Vancouver island, and in addition to this drawback the route is usually closed by the deep snow in the mountains for at least six months of the year.

The mountain-peaks in the Beaufort range in the vicinity of the *You* group reach elevations exceeding 6,000 feet above sea-level. This range may be termed the backbone of Vancouver island. It is made up of mountain-peaks, the summits of many of which are so sharp as to have the appearance of saw-teeth, while the slopes are for the most part precipitous, but in many instances terraces and basins have been excavated near the summits by glacial action, and several isolated glaciers are observable from nearly any point near the head of Bedwell river. One of the largest of these glaciers is near Della lake at an elevation of about 4,300 feet above sea-level on the easterly slope of the Beaufort range.

Geology.—Dr. Dolmage, in the Summary Report for 1920, refers to the occurrence of gold-bearing quartz veins in the Kennedy (formerly Elk) River section near the head of Kennedy lake, about 24 miles almost due south of the *You* group of mineral claims, where the geology is so very similar to that surrounding the *You* group that his remarks are copied in part as follows:—

"Gold in small quantities is found in the beach placers of Wreck bay and in small quartz veins cutting the Vancouver volcanics in the vicinity of Elk river, which flows into the East arm of Kennedy lake. Gold-bearing quartz veins were known as early as 1898 to occur in the Elk River section. These veins occur in the andesite of the Vancouver group in close vicinity of large intrusions of a very fine-grained dark-grey diorite, with which the veins are thought to be genetically connected. The andesites are somewhat sheared, but, except in the immediate vicinity of the intrusions of diorite and the veins, are comparatively fresh. Where altered they consist largely of chlorite and secondary quartz, and near the contacts of the veins contain considerable pyrite. The diorite was not observed except in the vicinity of Elk river and the northern extremities of Kennedy lake, and showed—by the fact that it formed dykes in the granodiorite of the Coast Range batholith—that it belongs either to an exceedingly late phase of the batholith period or to some subsequent period of intrusion. No evidence could be found to determine which. The veins are all small, that on the *Rose Marie* being the largest. They have a common and persistent attitude, striking about N. 45° E. and dipping north-west 70° to 80°. They consist of coarsely crystalline quartz containing many vugs and small grains of pyrite, galena, zinc-blende, tetrahedrite, and gold which is sometimes visible.

"These gold-bearing quartz veins constitute a type of mineral-deposit which is different from any previously described in connection with the west coast of Vancouver island, and although they have not yet proved to be of commercial importance, they do in places carry good gold values and may with further prospecting and developing turn out to be valuable. From an examination of the Wreck Bay formation and of the intervening topography, it seems almost certain that the gold content of those gravels originated in the quartz veins of this district."

Ore-deposits.—On the *You* group of mineral claims there occurs a gold-bearing quartz vein in a fissure in a shear-zone in the Vancouver volcanics. The fissure is about 3 feet wide between very persistent, well-defined walls, with several inches of gouge separating each wall from the material which fills the fissure. The vein-filler is made up of quartz from 6 to 9 inches wide, some breccia, and gouge. The quartz is mineralized with iron pyrite, galena, zinc-blende, tetrahedrite, and gold, which often occurs free and visible to the naked eye.

The fissure is exposed in a narrow gulch, the effects of erosion, for a vertical height of about 500 feet above the trail, where an adit is driven along the strike of the vein in a north-easterly direction. The dip of the vein is practically vertical. Owing to the quantity of water flowing down the gulch no close examination could be made of the vein above the adit on the trail. The fissure, with similar filling, has been traced down the mountain-side for a distance of about 500 feet below the trail, where it has been exposed in open-cuts made at intervals.

Samples and Assays.—Four samples were taken from the adit, which assayed as follows:—No. 1, general sample from dump: Gold, 2.92 oz.; silver, 2.6 oz.; copper, 0.5 per cent. No. 2, from across 8 inches quartz 24 feet from portal: Gold, 3.56 oz.; silver, 3.4 oz.; copper, 0.2 per cent. No. 3, from across 8 inches quartz 36 feet from portal: Gold, 0.92 oz.; silver, 0.8 oz.; copper, *nil.* No. 4, from across 4 inches quartz near face of adit: Gold, trace; silver, trace; copper, *nil.*

Development-work.—The development-work on the *You* group of mineral claims consists of several open-cuts and on adit driven 78 feet as a drift along the strike of a quartz vein. The backs above the adit level rise very steeply, so that within a comparatively short distance

they will reach several hundred feet and expose a considerable tonnage of ore. Owing to the regularity of the walls of the fissure, the friable character of the vein-filler, and width, it is possible to mine the ore at a low cost.

The facilities for milling and concentrating could hardly be excelled, for the reason that Bedwell river can be developed to furnish all the water-power necessary to drive all machinery, as well as for concentrating purposes. Considered from a commercial standpoint, there is a good chance for Woodworth's operations to result satisfactorily, provided the high gold values in the quartz are persistent and he carries on operations economically as an individual concern free from the usual excessive overhead charges of most companies.

White Group.

This group of mineral claims was described in the Annual Report of the Minister of Mines for 1919, page 198, but as further work has been done since then, the group was again examined by the writer on September 28th, 1921. The *White* group is on Tofino creek or, as it was formerly named, Deer creek, which empties into the head of Tofino inlet, which is the southernmost arm of Clayoquot sound. Tofino inlet penetrates the coast of Vancouver island in a north-easterly direction for about 12 miles, the entrance being separated from the Pacific ocean by a narrow peninsula, on the ocean side of which is Long beach, that has derived its name from the extensive sandy beach that stretches along the ocean shore for several miles and suggests a promising site for a popular summer resort.

About 6 miles from its head, Tofino inlet is divided into two arms, the westerly one being about 3 miles long, to the mouth of Tranquille creek, while the easterly or main arm, which extends to the mouth of Tofino creek, is about 6 miles long. The two arms are separated by a narrow mountainous peninsula, an extension of the high precipitous mountain range that forms the divide between Tofino and Tranquille creeks. The mountain range was a much-favoured field for prospectors about 1898, when several groups of mineral claims were located, some of which have since been Crown-granted, but none have been developed to any great extent and all of them are still held by the original locators.

The mountains south-easterly from Tofino creek, which form the divide between it and Kennedy Lake and river, were also much favoured by prospectors about 1898, when several groups of mineral claims were staked. Most of these are in good standing to-day and are still held by the original locators.

The exceptionally high-grade copper-sulphide ores found outcropping on the surface appealed to the prospectors of that time, but lack of transportation from the mountains to the sea-coast, distances varying from 1 to 3 or 4 miles, together with the fact that all of the ore-deposits belong to the contact-metamorphic type, in which the ore occurs in irregular lenses, have retarded the progress of mining development.

Attention is here called to this section of the west coast of Vancouver island in this report because it appears to offer one of the most attractive fields for the prospector on the island, and its possibilities are very promising.

Area and Title.—The *White* group contains the *White*, *Norman*, *Walton*, *Dunlop*, and *Alpha* mineral claims, covering an area of approximately 250 acres. The group is owned by Duncan McMillan, of Victoria, and Wm. Walton, of Clayoquot.

Geography.—The *White* group is about 120 miles, as the crow flies, north-westerly from Victoria, but under present transportation facilities it is necessary to travel considerably farther, as the Canadian Pacific Railway Company's west coast steamer must be taken to Tofino village, near the entrance to Clayoquot sound, where transfer must be made to a launch to travel from the village to the head of Tofino inlet, about 22 miles distant. There is an excellent trail about 1½ miles long from the head of the inlet up Tofino creek, on the westerly side, to the *White* group, which is at an elevation of about 2,500 feet above sea-level.

Geology.—The country-rock on the *White* group appears to be chiefly granodiorite and diorite, but there are also rocks which belong to the Vancouver group of volcanic rocks, with interbedded beds of limestone similar to the country-rock classified by Dolmage as being observed by him in the Kennedy lake, south-easterly from the *White* group, and Bedwell sound and other points north-westerly from the group. There is a wide zone of this character of rock which can be traced in a north-westerly direction from Clayoquot arm of Kennedy lake to Tahsis canal, Nootka sound.

On the *White* group there are evidences of intrusions in the limestones of a rock similar to diorite, which have so intensely metamorphosed the limestone as to alter it to rocks containing garnet, epidote, pyroxene, quartz, tremolite, and actinolite. These contact-metamorphic rocks cover quite a large area on the *White* group, on a bench near the cabin, and have obliterated the definite line of the contact between the limestone and igneous rocks.

Ore-deposits.—There is much difficulty in determining the structure and extent of the ore-deposit on the *White* group, for the reason that there are several lenticular occurrences of high-grade chalcopyrite ore scattered over about an acre or more of a bench at an elevation of about 2,500 feet at the foot of a high mountain. This ore is closely associated with a belt of contact-metamorphic rocks containing garnet, epidote, quartz, some tremolite, pyroxene, and actinolite. The ore is found under the roots of trees and in many shallow holes sunk for prospecting-work. Apparently the ore is not in-place on the bench, but has possibly fallen from a fissure in the precipitous mountain-side in a northerly direction from the bench or terrace, and which overlooks it. Erosion has cut a channel between the vertical walls of the fissure, which is about 5 feet wide, striking in a true north-westerly direction. No solid ore is found in either of two adits driven into the mountain-side—one in the face of the fissure; the other about 25 feet lower elevation, driven close to the north-easterly wall, but to one side in order to avoid the stream of water that is continuously pouring over the face of the fissure. Contact-metamorphic rock is exposed in both of the adits, indicating the possibility of exposing ore at any time.

When it is considered that the mountain mentioned forms the comparatively narrow divide between Tofino and Tranquille creeks, also that on the Tranquille Creek slope copper-sulphide ore occurs in contact-metamorphic type of deposits striking north-westerly, it would appear to be advisable to prospect in that direction to determine whether there is any relationship between the occurrences of ore on the *White* group and those on the Tranquille Creek slope.

Development-work.—Since the *White* group was examined in 1919 there have been two adits driven into the mountain-side—one in the fissure, where falling water interfered with the work; the other at a lower elevation alongside of the fissure, so as to avoid the stream of water that flows between the walls during most of the year. The first-named adit is 15 feet long under cover, with an open-cut approach 10 feet long; the last-named adit is about 15 feet long.

Wanderer Group. This group of two mineral claims, owned by L. C. Grant, of Tofino, is specially mentioned in Dolmage's summary report as being an illustration of gold-bearing quartz veins which constitute a type of mineral-deposit different from any previously described in connection with the west coast of Vancouver island. The group was visited by the writer on September 24th, 1921, in order to examine development-work recently done. In the Annual Report of the Minister of Mines for 1918, page 262, there is a full description of this group; consequently such will not be repeated here.

Development-work.—The new development-work consists of two short drift-adits in addition to open-cuts and stripping, by which the quartz vein is exposed for several hundred feet along its strike. The upper of the two adits is 10 feet long under cover, with an open-cut approach in solid rock 14 feet long; the lower adit is also 10 feet long under cover, but the open-cut approach made in solid rock is not as long as at the upper opening.

Samples and Assays.—Two samples taken from the vein in September last assayed: No. 1, gold, 0.10 oz.; silver, 0.4 oz. No. 2, gold, 0.20 oz.; silver, 0.06 oz. Samples taken by the writer in 1918 assayed: No. 1, gold, 0.32 oz.; silver, 0.4 oz. No. 2, gold, 0.64 oz.; silver, 0.8 oz.

While the quartz vein maintains its continuity with persistence, it remains very narrow, averaging only about 5 inches wide. On the other hand, its vertical extent up the mountain-side appears to be upward of 200 feet. It is possible that the width will increase in the vein above the elevation of the adits mentioned, in which event, if operations were carried on by a thoroughly experienced mining and expert millman, they might produce satisfactory results.

QUATSINO MINING DIVISION.

The mining industry in the Quatsino Mining Division has shown but little progress during 1921. The annual assessment-work has been done on mineral claims that have not been Crown-granted and some prospecting-work has been done by a few prospectors, chiefly those who reside near Holberg, at the head of the West arm of Quatsino sound, but there has been no new work of importance done.

Old Sport Group.

Work on this group of mineral claims, which was suspended in 1920 to await the erection of a concentrating-mill, has not been resumed, but it is expected that the Coast Copper Company, which is controlled by the Consolidated Mining and Smelting Company of Canada, will during the coming year build the proposed concentrating-mill and put the mine on a producing basis. In the meantime Wm. Clancy, the manager, and his assistant have been making a detailed geological survey of that section of the Quatsino Mining Division, in order, if possible, to determine the extent, structure, and relationship (if any) which the several outcroppings of copper-sulphide ore occurring in the district bear to each other. This work is in line with the prospecting-work that has been done by the engineers of the Consolidated Company in other portions of Vancouver island. It is said to be preliminary to the establishment of a copper-smelting plant on the Coast in the near future.

NANAIMO MINING DIVISION.

Placer-leases.

During 1921 there has been quite a revival in activity relative to securing placer-mining leases in the Nanaimo Mining Division, on the northernmost part of the coast of Vancouver island. Ten leases have been granted by the Gold Commissioner during the past year and several applications for leases made recently are pending. The ten leases granted are for areas in Townships 23, 24, 25, and 19, near Cape Sutil, a short distance westerly from the mouth of the Nahwitti river. The leases applied for are for areas in the vicinity of Fisherman bay, a few miles easterly from Cape Scott, the extreme north-westerly point on Vancouver island.

Ever since 1899, when placer gold was discovered associated with the black sand on the beach at Wreck bay, in the Clayoquot Mining Division, on the west coast of Vancouver island, also near Cape Sutil (then known as Cape Comerell), there have been intermittent efforts made by a few prospectors to create an excitement in favour of placer-mining along the beaches at several points on the west and north coasts of the island.

Several years ago some of the settlers at Cape Scott succeeded in securing small quantities of placer gold from the beach sands near Fisherman bay. The beach near the mouth of the Nahwitti river, as well as near Cape Sutil, was also repeatedly prospected, and small quantities of gold recovered at points where intensive concentration by wave-action has taken place. Whenever operations were attempted from the standpoint of a commercial proposition in the past they have invariably failed. The excuse generally made for these failures has been inability to save the fine flaky gold by using the ordinary methods.

It would appear that there have been two good reasons to account for these failures. The first is the fact that landings can only be made at irregular and infrequent intervals at the points referred to, which are on the open coast exposed to all winds and storms of the Pacific ocean. This causes expensive delays occasioned by loss of time. The second is the same reason why operations were abandoned at Wreck bay years ago, because the average quantity of gold in the black sand was too small to be extracted on a commercial scale, except where intensive concentration by wave-action had taken place, and such occurrences are very pockety, badly scattered, difficult to find, and after being worked over the first time are worked out.

Of course, it is possible that further systematic and thorough prospecting may result in the discovery of the source of the gold, but even then the gold-bearing quartz would have to carry sufficient value and occur in great enough extent to permit of mining operations being carried on successfully. It is hardly likely that any such discovery will be made at this late date, after many prospectors have expended energy and time searching for such source during the past twenty years, although, of course, as already stated, there is a possibility.

In the Nanaimo Mining Division the development of several prospects with promising possibilities has been continued during 1921, but the number of prospectors who make a business of exploring new sections in the mountain ranges in search of occurrences of minerals of economic value has been quite limited. With the exception of the parties of mining engineers sent into the field by the Consolidated Mining and Smelting Company, already referred to in this report, and whose activities were mainly directed towards the Nanaimo Mining Division, the writer failed to meet many other prospectors in that Division during the past season.

Nearly all of the month of July was devoted by the writer to a visit to Tatlayoko Lake and Klinaklini River sections, on the Mainland, in the extreme northerly part of the Nanaimo Mining Division, which owing to the lack of any trails from the Coast from either head of Bute or Knight

inlets can only be reached at the present time by travelling into the Chilcotin country and crossing the low summit between Chilko and Tatlayoko lakes.

The chief point of interest in this part of the Nanaimo Mining Division is that within its boundaries the easterly contact between those granitic rocks and the sedimentaries of the interior can be traced. This fact is also referred to by Wm. Fleet Robertson, Provincial Mineralogist, in his report on the Tatlayoko Lake section, published in the Annual Report of the Minister of Mines for 1910, in which he also draws attention to the possibilities of the section as a promising field for productive mineral-deposits to occur.

The writer during his trip examined the property of the Tatlayoko Lake Gold Mining Company, Limited, near the foot of Tatlayoko lake. At the headwaters of the Klinaklini river he examined the iron-ore property of the Hæmatite Mining Company.

Later in the season a trip was made to Siwash creek, near the head of Powell lake, where the *Copper Bowl* group of mineral claims was examined. Near Olsen Landing on Powell lake the mineral claims owned by George Kennedy and Jack Howse were examined. The *Ophir* and *Shamrock* mineral claims near Powell lake, about 3 miles from the Powell River pulp-mill, were also examined on this trip.

It is interesting to find that the ore-deposits on the properties mentioned in the Powell Lake section on Siwash creek occur in a zone of metamorphosed sedimentary rocks, one of the roof-pendants as described by Chas. Camsell and other geologists as occurring as inclusions in the granodiorite batholith of the Coast range. The values carried by the ore range from traces to 0.42 oz. in gold, from trace to 43.2 oz. in silver, and from 0.5 to 1.3 per cent. in copper.

On Texada island development-work has been done during 1921, which has been examined during the past season. This work has been chiefly confined to the *Marble Bay* mine, the *Nancy Bell* and *Marjorie* groups, and work done by John D. Edwards on a group of mineral claims near Gillies bay, Texada island.

On Quadra island development-work during 1921 has been confined to that done on the *Wanderer* and *Prospector* mineral claims near Deep Water bay, which were examined in June last. Samples from these claims assayed: Gold, trace; silver, 1.8 oz.; copper, 19 per cent.; and gold, trace; silver, 1.8 oz.; copper, 15.5 per cent.

From June 23rd to 26th was occupied in examining the *Silver Leaf* and *Mountain Ash* mineral claims, owned by Thos. Service, of Cowichan Lake. These are on a small creek, one of the headwaters of the Jump river, which flows into the South fork of the Nanaimo river. The interesting feature about this property is the values carried by the ore, which occurs in a well-defined vein in a shear-zone. The samples from the *Silver Leaf* claim assayed: Gold, 0.32, 0.66, 0.2, and 0.2 oz.; silver, 2.2, 2, 1.2, and 0.4 oz.; copper, 14.5, 3.7, 4.7, and 11.2 per cent. Samples taken in October by the owners from the same claim, after some development-work had been done, assayed: Gold, 0.80, 0.66, and 0.86 oz.; silver, 1.6, 1, and 1.4 oz.; copper, 5.5, 5, and 5.1 per cent.

TATLAYOKO LAKE SECTION.

Tatlayoko Lake Gold Mining Co.

The following is a report on the *Tatlayoko* group of six Crown-granted mineral claims, situated at an elevation of about 5,000 feet above sea-level on the easterly side of the narrow valley formed by the East fork of the Homathko river, about 6 miles from the southerly end of Tatlayoko lake, after an examination made by the writer during July, 1921. The Tatlayoko Lake section of the Nanaimo Mining Division is in the northernmost portion of that Division on the Mainland on the Coast watershed and near the easterly boundary of the Coast Range granodiorite batholith. The section has received but little attention from prospectors in the past, chiefly for the reason that it is inaccessible from the Coast, and the only route by which it can be reached at present is via Pacific Great Eastern Railway to Williams Lake; thence by automobile or horse-drawn wagon via Alexis Creek to the northerly end of Tatlayoko lake, a distance of about 150 miles.

The geology of a large portion of this section of the Nanaimo Mining Division is favourable for the occurrence of productive mineral-deposits, and if the section were more easy of access it would doubtless prove an attractive field for prospectors. The geologic conditions are described later in this report under the head of "Geology."

The only reports so far published on this section of the Nanaimo Mining Division are those in the Annual Reports of the Minister of Mines for 1910 and 1916; the former by the Provincial Mineralogist and the latter by John D. Galloway, the then Assistant Mineralogist.

The ore-deposits so far found in the Tatlayoko Lake section carry values in gold, silver, antimony, and sometimes copper, the mineralization being made up of iron pyrites, arsenopyrite, and antimony sulphide, with possibly some free gold.

The section is a fairly easy one to prospect, because the rock-exposures are frequent and extensive, especially above timber-line, which is at an elevation of about 5,000 feet above sea-level.

Area and Title.—The *Tatlayoko* group contains the *Tatlayoko, Tyee, Copper Dyke, Copper Dyke Extension, Isaac T.*, and *Spokane* mineral claims, which cover an area of approximately 300 acres. The claims are all Crown-granted and owned by the Tatlayoko Lake Mining Company, Limited; secretary, Matthew Sutton, 515 Dominion Building, Vancouver.

Geography.—The Tatlayoko Lake section of the Nanaimo Mining Division includes the area drained by the Tatlayoko lake, Matthew and Finnie creeks, and other branches of the Homathko river, on the Mainland of British Columbia, in the northernmost portion of the Division. The Homathko river is made up of two branches, the east and west, which form a junction a few miles southerly from the outlet of Tatlayoko lake and flow into the head of Bute inlet, one of the longest inlets penetrating the Mainland coast. The East fork of the Homathko river is the outlet of Tatlayoko lake, while the West fork has its source several miles north-westerly of that lake, in the range of mountains which forms the Coast watershed.

Geology.—The geology of the Tatlayoko Lake section has never been studied in detail so far as known to the writer. The report of J. D. Galloway, in the Minister of Mines' Report for 1916, affords evidence that, although he was limited as to time, he paid considerable attention to the geologic formations during his visit, and the Provincial Mineralogist, in the Annual Report for 1910, also briefly describes the more prominent features of the geology.

The writer observed particularly that a well-defined contact-zone occurs on and near the *Tatlayoko* group of mineral claims, between the Coast Range granodiorite batholith and the sedimentary rocks of the Interior plateau, with the granitic rocks occurring as intrusions into the older sedimentaries, which have consequently been so highly metamorphosed and altered as to be almost unrecognizable. The country-rock is also intruded by innumerable igneous dykes. A bed of conglomerate which is exposed between the upper and lower adits of the mine-workings is especially noticeable, and is particularly referred to by Galloway as follows:—

"It is probably a portion of the basal member of the sedimentaries series which is well exposed on the eastern side of Tatlayoko lake and includes the argillites and quartzites seen on this property. These rocks have been provisionally classified as representatives of the upper portion of the Hazelton formation, and from fossil evidence are placed as being of Lower Cretaceous age."

Ore-deposits.—Owing to the fact that the mine-workings had not been cleared out since work was suspended in the autumn of 1920, and that the argillite country-rock on the hanging-wall, which is very talcose next to the ore-body, the talc in places being 2 feet wide, had caved in many places along the drift portion of the upper adit, it was somewhat difficult to take samples without causing caving.

There are at least two well-defined persistent fissures on the *Tyee* and *Tatlayoko* mineral claims. These occur in a shear-zone in the metamorphosed sedimentaries in the near proximity to the intrusive granitic rocks of the batholith, and in the underground workings the upper or main vein in places is shown to occur at the contact of granitic and altered sedimentary rocks, with granite forming the foot-wall of the vein and argillite the hanging-wall. The general direction of the strike of the upper vein is N. 20° W. (mag.) and its dip at varying angles to the north-east.

There is a difference in elevation of about 150 feet between the upper or main vein and the lower, narrower vein. The strike of the lower vein is about N. 50° W. (mag.) and its dip, although in the same direction as that of the upper vein, is at a somewhat flatter angle.

The numerous dykes which outcrop on the surface do not appear to have interfered with the vein, except in one instance, where at the face of the upper adit, 367 feet from the portal, there occurs a dyke of apparently black igneous rock which cuts through the vein, so that in the face on July 15th, 1921, there was no ore exposed, but before reaching the dyke the vein is very persistent.

The portal of the upper adit is on the *Tyee* claim and is started in granite, and the adit is driven as a crosscut for 60 feet in a S. 50° E. (mag.) direction without intersecting the vein. At that point an upraise was made about 20 feet high and the vein exposed; consequently the

Morris's Camp, Chromium Creek, Nanaimo M.D.

Car-ferry "Canora" at Nannimo.

UNIVERSITY OF ILLINOIS LIBRARY

course of the adit was changed to easterly for about 30 feet, where the vein was exposed within argillite walls, on the adit level dipping about 40° to the north-east. From that point to the face the adit is driven as a drift along the strike of the vein in a general S. 20° E. direction a distance of nearly 300 feet, most of which distance is on the *Tatlayoko* claim. The vein is persistent but variable in width the entire distance. The width of the vein-filler, including the talcose gouge with the quartz-crushed rock gangue, varies from a few inches to the maximum width of 90 inches mentioned in the report of the Provincial Mineralogist in 1910 at the then face of the adit, 110 feet from the portal.

The underground workings on the lower vein were not examined, because the work had not been extended since the examination by Galloway in 1916, and owing to caving the adit was considerably blocked up. The outcroppings of both of the veins occur on the southerly side of a gulch in a very steep mountain-side about 300 or more feet above timber-line and at an elevation of nearly 6,000 feet above sea-level.

Samples and Assays.—The writer took six samples from the upper drift, which assayed as follows: No. 1, from across 6 inches near face: Gold, 0.14 oz.; silver, 1.5 oz. No. 2, from across 8 inches, 50 feet from face: Gold, 0.06 oz.; silver, 0.6 oz. No. 3, from across 6 inches, 50 feet from No. 2: Gold, 0.6 oz.; silver, 1.2 oz. No. 4, front across 6 inches, 45 feet from No. 3: Gold, 0.76 oz.; silver, 5.5 oz. No. 5, from across 10 inches, 50 feet from No. 4: Gold, 0.36 oz.; silver, 3.7 oz. No. 6, selected samples for antimony: Gold, 0.12 oz.; silver, 2.7 oz.; antimony, 43 per cent.

Galloway reports in 1916 samples and assays as follows: No. 1, across 6 inches at point 15 feet from face: Gold, 0.08 oz.; silver, 0.8 oz. No. 2, across 18 inches at point 170 feet from face: Gold, 0.50 oz.; silver, 10.3 oz. This No. 2 sample would represent sampling between Nos. 4 and 5 in first list. No. 3, across 18 inches at point 100 feet in from portal: Gold, 0.08 oz.; silver, 0.9 oz. No. 4, picked specimen from dump showing high percentage of antimony with gold: Gold, 0.02 oz.; silver, 4.2 oz. Galloway's No. 3 sample was evidently taken near the point where the vein is first exposed on the adit level.

The Provincial Mineralogist's samples taken in 1910 are reported as follows: No. 1, rough sample of outcrop of upper vein assayed: Gold, 3.50 oz.; silver, $26 to the ton. No. 2, from across about 12 inches in raise 18 feet high at end of crosscut, part of adit where vein is first exposed: Gold, 0.28 oz.; silver, 2.60 oz.

"At the face of the tunnel (then 110 feet from portal) the whole drift was in ore, and apparently has not disclosed the full width of the ore-body. What was considered the 'hanging-wall' was quartz which I had sampled, and it assayed: Gold, $8; silver, 16 oz. to the ton. Below this the vein was exposed for a width of 90 inches, which I sampled in three parts of 30 inches each, and assayed as follows: Thirty inches next hanging-wall: Gold, trace; silver, 0.4 oz. Thirty inches middle of vein: Gold, 0.14 oz.; silver, 1.0 oz. Thirty inches bottom of vein: Gold, 0.20 oz.; silver, 30.4 oz.

"The lower 30 inches of the exposure in the face of the tunnel contains a considerable percentage of sulphide of antimony; this part of the vein continued into the floor of the tunnel for a depth not determined, so that the 30 inches sampled does not represent the full thickness of this grade of ore."

Development-work.—During the past year the development-work on the property has been almost exclusively confined to the following: Construction of a good wagon-road, with the necessary bridges across tributaries of the East fork of the Homathko river, to connect the south end of Tatlayoko lake with a new sawmill about 2 miles from the foot of the mountain in which the ore-deposits occur; construction of a new horse-trail from near the sawmill to the mine-workings, a distance of about 4 miles; developing water-power on Finnie creek and constructing ditch and flume to sawmill-site; constructing sawmill with capacity to cut about 3,000 feet board measure daily.

The development-work in the mine-workings is confined principally to the *Tyee* and *Tatlayoko* mineral claims and consists of two adits. The upper adit is 370 feet in length and the lower one 250 feet in length. There are two raises from the upper adit; one at a point 60 feet from the portal is 18 feet high; the other at a point 50 feet from the face of the adit is 20 feet high.

—KLINAKLINI RIVER SECTION.

The Klinaklini River section was visited by J. D. Galloway in 1916 when he was Assistant Provincial Mineralogist. He reached the headwaters of the Klinaklini river while on a trip from Bella Coola to Alexis Creek, in the Chilcotin country, and en route examined the groups of mineral claims on Chromium creek, the headwaters of the Klinaklini river, owned by the Hæmatite Mining Company. The writer in July last examined the same property, but reached the headwaters of the Klinaklini river from the east after passing the old Ben Franklin ranch on Tatla lake on his return trip from Tatlayoko lake. In Galloway's report, pages 166-168 of the Report of the Minister of Mines for 1916, he has described the geology and general characteristics of this section of the Nanaimo Mining Division quite fully, so that it is unnecessary to repeat such in this report.

The Klinaklini river is a stream several miles long; its course is very circuitous; its headwaters are made up from the junction of Chromium creek with two small tributaries which head in the easterly slope of the Coast range at an elevation of about 6,500 feet above sea-level. The main stream from below the junction of these creeks is called the Klinaklini river, which flows south-easterly through Render or Miners lake; then easterly a few miles to a wide valley known as Klinaklini flats, where the course changes to a westerly direction for about 5 miles. The river then flows through Pat McClinchey's ranch, beyond which it widens and forms One Eye lake. The lake is about 6 miles long and its valley is wide ranch land to its foot, where is located the Klinaklini telegraph-office at Sam Colwell's ranch. From the ranch the course of the river is in a general south-westerly direction through the Coast range to the salt water at the head of Knight inlet. Autos can be used on the wagon-road the entire distance from Alexis Creek to One Eye lake.

Haematite Mining Co.

The property known as that belonging to the Hæmatite Mining Company comprises a large group of mineral claims located at the head of Chromium creek, near the base and on the westerly slope of Perkins peak, the most prominent landmark in that section and the highest peak in that portion of the Coast range. Perkins peak reaches an elevation of nearly 10,000 feet above sea-level. The group of claims occupies the whole of the glacial cirque at the head of Chromium creek and the boundaries extend down that creek on both banks for a very considerable distance, there having been about seventy claims staked during 1920, in addition to the thirteen held in 1916 when Galloway made his examination. The entire group of claims is about 1,000 feet above timber-line, which fact led to the construction of a large rock cabin for a mine camp at a point far enough down the creek as to be considered beyond the danger-line from either snow or rock slides.

Geology.—The Hæmatite group of mineral claims is reached by travelling a pack-trail through the mountains for about 20 miles in a general south-westerly direction from One Eye lake to the base of Perkins peak at the head of Chromium creek, where the creek forms a wide deep gulch, with increasing width below the glacier at its source. The mountains on three sides are high, with precipitous slopes covered with slide-rock to a depth that is undetermined. A considerable proportion of these slides is made up of float iron ore in pieces varying in size from gravel to large lumps.

The country-rock in the vicinity of the group of claims is chiefly argillite, which has in many places been intruded by the granitic rocks of the Coast Range. The zone of contact between the granitic rocks and the older sedimentaries and volcanics is fairly well defined in the locality of the occurrence of the iron-ore deposits which Galloway considers are of contact-metamorphic origin.

Ore-deposits.—It is very difficult to form any opinion as to the extent of the deposits of hæmatite-iron ore, because, although several open-cuts have been made across the mineralized zone, none of these were deep enough to expose bed-rock, so that the only opinion that could be formed as to quantity of ore is from an estimate of the proportions of ore and country-rock in the dumps and along the walls of the open-cuts. Such an estimate could not be considered at the time of the writer's visit, because all of the cuts had been made previous to Galloway's examination in 1916 and were more less filled with slide-rock that would require the steady work of four or five men for weeks to remove.

The only development-work besides the open-cuts is a crosscut adit described by Galloway as being 600 feet long, but which in 1921 could not be examined because its caved condition made it impossible to enter it.

Samples and Assays.—Although it was not possible to take any samples from "ore in-place" owing to the conditions of the workings, one general sample and one selected were taken from dumps. These assayed: General: Iron, 48.9 per cent.; phosphorus, trace; sulphur, trace; silica, 30.7 per cent. Selected: Iron, 57.6 per cent.; phosphorus, 0.24 per cent.; sulphur, trace, silica, 15.6 per cent.

Galloway's samples assayed:—No. 1: Iron, 47.6 per cent.; phosphorus, trace; sulphur, *nil*. No. 2: Iron, 48.4 per cent.; phosphorus, trace; sulphur, *nil*. Selected ore: Iron, 57 per cent.; phosphorus, trace; sulphur, *nil*.

Conclusions.—It would appear as though under existing circumstances with regard to transportation facilities it is inadvisable to consider that the Klinaklini iron-ore deposits in themselves have any present commercial value, but that the evidences of mineralization are so pronounced and cover such a large area, not being merely confined to the Chromium Creek deposits, as to make the section quite attractive to prospectors searching for other minerals than iron ore.

In the event of other discoveries being made in the zone of contact represented in the section, such might develop into mines having sufficient commercial value to warrant the improvement of the transportation facilities to a point where the iron ore could be mined profitably. There is no question but that the quality is such as would make it an extremely popular supply for manufacture into iron or steel products.

Powell Lake Section.

Copper Bowl Group.

This group contains thirty-five mineral claims situated on and near the summit of the Coast range of mountains, between Powell lake and Theodosia arm of Malaspina inlet, about 80 miles from the city of Vancouver. The discovery of the occurrence of ore near the summit was made by Oswell Stevenson, of Powell lake, during a hunting-trip after mountain-goat. The geology of this interior section tributary to Powell lake has never been studied by any members of the Geological Survey of Canada. Along the Mainland coast-line the geology was examined by J. Austen Bancroft, whose report is published as Memoir No. 23, "Geology of the Coast and Islands between the Strait of Georgia and Queen Charlotte Sound, B.C.," Canada Department of Mines, Geological Survey Branch, 1913.

Powell lake is about 20 miles long, breaking through the Coast range of mountains from Powell river, locally called Goat river, from which the lake is fed, in a south-westerly direction, and having its outlet at Powell River falls, the power plant for a large pulp-mill. For the most part the mountains rise precipitously from the lake-shores to considerable elevations, though an exception to this rule is found at the mouth of Olsen river, which flows through a fairly wide valley, known as Olsen valley, into the westerly side of the lake about 10 miles from its outlet. In this valley there are several settlers who are cultivating farms along the Olsen river where the timber has been logged off, and they are apparently prosperous.

This discovery of the outcroppings of ore-deposits at and near the summit of the Coast range in this section furnishes another instance of the occurrence of a belt of metamorphosed stratified rocks which remain to-day as remnants of the roof which once covered the intrusive rocks of the batholith. The theory advanced by Bancroft, that where such ore-deposits occur in the roof-pendants they will be found up towards the tops of the mountains rather than at the lower levels, is proven to be correct with regard to the occurrences of ore not only on the *Copper Bowl* group of mineral claims, but also at other points in the Coast Range batholith. Prospectors who have during the past three or four years been searching for such occurrences have found out that to be successful their work must be done at the higher altitudes, because it is very seldom that any outcroppings of ore-deposits occur at lower levels.

Area and Title.—The *Copper Bowl* group contains thirty-five mineral claims, which cover an area of approximately 1,700 acres. The title to this group is held by Oswell Stevenson, A. L. Gilfillan, Mrs. M. Berry, Mondef Anderson, Robert Polsin, and W. Simmons, who form a syndicate, for which A. L. Gilfillan, Room No. 5, Williams Building, Vancouver, is trustee.

Geography.—The *Copper Bowl* group of mineral claims is in the Mainland portion of the Nanaimo Mining Division, in the Coast range between Theodosia arm of Malaspina inlet and the head of Siwash creek, which flows into Powell lake, on the westerly side of the lake, about 16 miles above its outlet. The property is about 80 miles distant from Vancouver and is reached at present by steamer to Powell River pulp-mills; thence transfer to foot of Powell lake by

auto; from there by launch to the mouth of Siwash creek, and on foot up Siwash creek, where there is only a very poor trail, to near the head of the creek at the foot of the mountain on which the group of mineral claims is located. An alternative route by which the property could be reached is by steamer to Theodosia arm of Malaspina inlet; thence through the woods to the claims; but before this route, which is the most direct, can be travelled as a pack-trail, it is necessary to cruise out and construct a trail from the shore to the claims.

Geology.—The mountains in the vicinity of Theodosia arm, as well as Powell lake, appear to have attractive features for prospecting, for the reason that at some points along the shore of the arm there are outcroppings of greenstones of the Valdes group of volcanic rocks, argillites, and quartzites, indicating the occurrence of belts of roof-pendants, with possibly ore-deposits. The presence of these rock formations, when considered with the outcroppings of ore-deposits at and near the summits of the mountain range between Theodosia arm and Powell lake, which occur in a similar rock formation, suggests the advisability of more thorough prospecting than has been done in the past.

Siwash creek, which was followed to reach the *Copper Bowl* group, from near its mouth on Powell lake for a distance of about 5 miles to within a short distance of its head is a torrential stream that flows in a general south-easterly direction, following the general line of strike of the altered sedimentaries. The grade of the creek-bed is very steep. The only rock formation observed near the creek is the granodiorite of the Coast range, but after climbing up a huge rock-slide that reaches to about 900 feet vertical height above the bed of Siwash creek, a contact is noticeable between the granodiorite and metamorphosed argillites and quartzites with the granodiorite on the easterly side of the altered sedimentaries. This contact is exposed in a deep, narrow, precipitous gulch in the mountain-side which extends from the summit down to the top of the rock-slide already referred to, and apparently follows the line of strike of the contact. The rocks are much sheared and fractured, indicating a shear-zone at the contact of considerable width. A stream of water was flowing down the contact-metamorphic rocks, where ore-outcroppings occur, at the time of examination, and this as well as the steepness of the gulch-bed interfered with the work, for the reason that there was no method to turn the water from the gulch and no rope to assist in climbing up the precipitous face of the gulch.

The occurrence of the metamorphosed sedimentaries in contact with the grandiorite was first observed above the top of the rock-slide at an elevation of about 3,000 feet above sea-level. From there the zone of the roof-pendant rocks appears to extend to the extreme summit of the mountain range and on to the opposite slope facing Theodosia arm, but not sufficient prospecting has been done to establish the continuity.

Ore-deposits.—The ore-deposits on the *Copper Bowl* group of mineral claims occur in a shear-zone of metamorphosed sedimentaries made up of argillites and quartzites at the contact between those rocks and granodiorite of the Coast Range batholith. The apparent strike of the belt of altered sedimentaries is north-westerly and the dip nearly vertical, but these data are not yet fully determined, neither is the extent of the ore-deposits, for the reason that there has not been sufficient prospecting or development work done. The shear-zone can be traced up towards the mountain summit by climbing up a deep, precipitous, narrow gulch from a point about 200 feet above the top of a huge rock-slide, about 900 feet vertical height above the bed of Siwash creek, where a few shots have exposed quartz carrying pyrite, arsenopyrite, a little galena, and chalcopyrite in a fissure. At the point where the mineralized quartz is first observed it appears to be narrow.

About 300 feet higher than the point just referred to more extensive outcroppings of sulphide ore occur, in which the mineralization is made up chiefly of pyrite, arsenopyrite, and chalcopyrite in a gangue composed of quartz and crushed country-rock. This occurrence is at a point on the mountain-side where a shelf or basin has been formed, and is an indication that continuity of the zone of metaorphosed sedimentaries is maintained, and suggests that more thorough prospecting-work is desirable in order to determine continuity and extent.

Samples and Assays.—A sample from the ledge-matter at the lowest point above the big rock-slide, where mineralization is observed, assayed: Gold, 0.20 oz.; silver, 43.2 oz.; copper, 0.5 per cent. The following are the assay results from samples taken in the basin or shelf about 300 feet higher elevation than the point just referred to: No. 1, from easterly end of shelf: Gold, trace; silver, 1.2 oz.; copper, 0.7 per cent. No. 2, from 15 feet from No. 1: Gold, 0.42 oz.; silver, 13.5 oz.; copper, 1 per cent. No. 3, from 20 feet from No. 2: Gold, trace; silver, 1.8 oz.; copper,

1.3 per cent. No. 4, from 15 feet from No. 3: Gold, trace; silver, trace; copper, 0.7 per cent. No. 5, from 15 feet from No. 4: Gold, 0.04 oz.; silver, 0.4 oz.; copper, 1 per cent. No. 6, from 30 feet from No. 5: Gold, trace; silver, 0.2 oz.; copper, 0.5 per cent.

Development-work.—The development-work on the *Copper Bowl* group of mineral claims is practically confined to surface-stripping and open-cuts preparatory to selecting the most desirable point at which to start a systematic method of general underground development.

Mayflower Group.

This group is in the Nanaimo Mining Division and contains two mineral claims, the *Mayflower* and *May*, owned by George Kennedy and Jack Howse, Foch Post-office, Powell lake. The group was examined on August 11th, 1921. The *Mayflower* group is in the mountains on the northerly side of the wide valley drained by Olsen river, which flows into Powell lake on the westerly side about 10 miles from the outlet. The timber in Olsen valley has been logged off for some years and several settlers are successfully farming on the land. The valley is about 4 miles long from the landing on Powell lake to Olsen lake, at the head of the valley. The mountains on both the north and south sides of the valley are high and rugged.

The mineral claims are reached by travelling a good road for about 3 miles from Olsen Landing to near the mouth of a small unnamed creek that flows from the mountains through a deep canyon about a mile from the wagon-road. The elevation of the mine-workings is about 2,000 feet above sea-level, and from the cabin salt water in Theodosia arm of Malaspina inlet can be seen.

Geology.—The country-rock on the *Mayflower* group of mineral claims is made up chiefly of metamorphosed sedimentaries, limestone, and intrusive granitic rocks of the Coast Range batholith, evidently another instance of the occurrence of a zone of undestroyed roof-pendants. Associated with the altered limestone there are bodies of such contact-metamorphic minerals as hornblende, epidote, and garnet, also occurrences of pyrrhotite, iron pyrites, and some chalcopyrite.

Ore-deposits.—There are three outcroppings of contact-metamorphic minerals, made up principally of hornblende, pyrrhotite, iron pyrites, epidote, and garnet, with some chalcopyrite, that are exposed in the deep canyon near the head of the small creek referred to. These outcroppings have apparently been crosscut by the canyon. They are exposed in each case for about 7 or 8 feet wide, but apparently are not continuous for any considerable depth. In two adits driven to develop the deposits at depth the results have not been satisfactory, as no ore carrying values is exposed in the upper adit, and in the lower one it looks as though the only occurrence of ore has been crosscut at the portal of the adit.

Samples and Assays.—Two samples were taken—one from the face of the No. 1 or upper adit; the other from the dump of pyrrhotite at the portal of the No. 2 or lower adit. The first of these samples assayed traces only in gold, silver, and copper; the second sample assayed: Gold, *nil*; silver, *nil;* copper, 3.7 per cent.

Development-work.—There are two adits which have been driven into the wall of the canyon; these are known as No. 1 or upper adit and No. 2 or lower adit, the lower one being about 300 feet down the canyon from the upper and at about 70 or 80 feet lower elevation. The No. 1 adit is 72 feet long, driven in a north-westerly (mag.) direction; No. 2 adit is 38 feet long, also driven in a north-westerly (mag.) direction. There is also an open-cut approach 15 feet long to the No. 2 adit.

Ophir Group.

This group was examined on August 12th, 1921. It contains two mineral claims recorded as the *Ophir* and *Shamrock*, owned by J. Shearman; post-office address, Powell River. The *Ophir* group of mineral claims is on Copper creek, a small stream flowing in an easterly direction into the north side of Powell lake, about 3 miles above its outlet near the Powell River paper-mills. The *Shamrock* mineral claim is on the northerly side of Copper creek and the *Ophir* claim on the southerly side of the creek adjoining the *Shamrock*, but with its westerly boundary a short distance westerly from that end of the *Shamrock* claim.

Geology.—The country-rock on the *Ophir* group of mineral claims resembles diorite, which is considerably sheared and fractured. In the shear-zone there occurs a system of fissuring, and one of these fissures on the *Shamrock* claim is filled with breccia and quartz, the quartz portion of the vein-filler being about 7 feet wide. The line of strike of the fissure is north-easterly and dip 45° to the north-west (mag.). The vein-filler is mineralized with particles of galena, chalcopyrite, and iron pyrites disseminated irregularly through the quartz and breccia.

Ore-deposits.—The deposit or vein of ore on the *Shamrock* claim has not been developed to a sufficient extent to determine many facts relative to its length or width, the latter measurement only having been shown at one point underground where in the face of a crosscut adit the portion of the fissure filled with quartz is 7 feet wide, sparsely mineralized, but not enough so as to warrant shipping as ore. The deposit does appear to have sufficient indications of carrying enough values to make it an ideal concentrating proposition, especially when it is considered that Copper creek carries sufficient water for concentrating purposes.

Samples and Assays.—No samples were taken during the examination, but in 1917 a sample of sorted ore taken by the writer of this report assayed: Gold, 0.2 oz.; silver, 9.8 oz.; copper, 1.9 per cent. A grab sample assayed: Gold, 0.02 oz.; silver, 1.8 oz.; copper, 1.1 per cent.

Development-work.—The development-work consists of a wide open-cut approach 12 feet long to a crosscut adit 27 feet long driven in a N. 50° W. (mag.) direction.

On the *Ophir* claim of the group the conditions with regard to the geology and ore-deposits are very similar to those on the *Shamrock* claim; in fact, it appears as though the ore-deposit extended on to the ground occupied by the *Ophir* claim, but the dip of the fissure is much flatter than on the *Shamrock* claim and in the opposite direction. The outcroppings of mineralized vein material on the *Ophir* claim are at a somewhat higher elevation than those on the *Shamrock* claim and have been developed less. The development-work on the *Ophir* is represented by two large open-cuts.

Strathcona Park Section.

Paramount Mining Co.

The *Lynx*, *Paw*, and *Shot* groups of mineral claims on Myra and Price creeks, which flow into Buttle lake near its head, are owned by the Paramount Mining Company; Joseph Errington, of San Francisco, managing director. In the Annual Report of the Minister of Mines for 1920, pages 207 and 208, these groups of mineral claims were fully described. During 1921 the systematic prospecting-work that was carried on during the previous year has been continued, and Crown grants have been applied for with regard to several of the claims contained in the groups.

Texada Island Section.

The mining industry on Texada island has not been as active during 1921 as in previous years owing to the closing-down of the *Marble Bay* mine, which has been a regular shipper of copper-gold ore carrying values in excess of the usual averages contained in the ores from copper-mines in the Coast District.

The prospecting-work done by diamond-drilling during 1920 below the 1,600-foot level had exposed an ore-body at a lower level than had heretofore been prospected, and nearly under the ore-body mined from the 1,600-foot stope, and arrangements were being made to continue sinking the winze from the 1,600-foot level, and to drift on the newly discovered ore-body to determine its extent preliminary to stoping.

The slump in copper took place about the same time, so the management decided to close all work down until the copper market recovered sufficiently to guarantee profitable operations.

The ore-body exposed by the drill-holes was quite promising, and the assays from the drill-cores showed about the same values as the average shipments of first-class ore have carried in the past.

Owing to the closing-down of the *Marble Bay* mine the only production from Texada island during 1921 was a limited tonnage of magnetite-iron ore from the *Good Hope* mineral claim on Raven bay, also of limestone from the quarries on Sturt (Marble) bay and on Blubber bay, at the north-westerly end of the island.

Development-work has been done during 1921 on the *Marjorie*, *Nancy Bell*, and *Sentinel* groups of mineral claims, also by John D. Edwards on his group of claims near Gillies bay.

Marjorie Group.

This group, which contains the *Marjorie*, *Fairview*, *Wild*, *Saga*, and *Tenas Fraction* mineral claims, was bonded in 1921 by Jack McConville, of Vananda, and partners, who extended the development-work done in the past, and when an examination was made by the writer on May 29th, 1921, were preparing to build a mill and concentrating plant near the mine-workings. As the *Marjorie* group was fully described in the Annual Report of the Minister of Mines for 1916, it is unnecessary to repeat the description in the present report. The ore-deposits on the *Marjorie* group are a system of quartz veins occurring in porphyrite country-rock not far from its contact with the Marble Bay limestone.

The values carried by the quartz-vein filler are quite erratic, as shown by the assays of three samples taken during the examination. No. 1, from a prospect-hole on a quartz vein about 220 feet north-westerly from the main shaft, assayed: Gold, trace; silver, trace. No. 2, from same prospect-hole, assayed: Gold, *nil;* silver, *nil.* No. 3, from pay-shoot about 4 inches wide from drift from the main shaft, assayed: Gold, 4.5 oz.; silver, 0.5 oz. The vein-filler at the point sampled consists of quartz 13 inches wide, gouge about ¼ inch wide, and crushed country-rock and quartz about 24 inches wide.

Nancy Bell Group.

This group contains three Crown-granted mineral claims, designated as Land Lots Nos. 44, 46, and 105, owned by Wm. Lee and Wm. McDonald, of Vananda and Hugh McMillan, of Nanaimo. The property was examined on May 30th, 1921. That part of the *Nancy Bell* group of mineral claims designated as Land Lot No. 44, originally known as the *Silver Tip* mineral claim, has a history extending back to 1897, when James Findlay, of Vancouver, acting for a St. John, New Brunswick, syndicate, developed it by sinking two shafts on the strike of a fissure-zone in porphyrite country-rock. One of the shafts is 145 feet deep; the other 150 feet, with an interval of 200 feet between them. Some drifting was also done from the bottom of the last-named shaft, also from a station at the 50-foot level. About 1900 all work was suspended; later the buildings erected for a camp were destroyed by fire. Since then, until last year, there has been no activity on the *Silver Tip* mineral claim.

During the past year the *Silver Tip* (Land Lot No. 44), *Nancy Bell* (Land Lot No. 46), and the *Thyee* (Land Lot No. 105) mineral claims have been consolidated under the ownership before mentioned and development-work has been progressing, superintended by Wm. Lee, who has since 1875 acted as local manager for the Puget Sound Iron Company, owners of all of the magnetite-deposits on the west coast of Texada island.

Geography.—The *Nancy Bell* group of mineral claims is in the north-westerly portion of Texada island, near the northerly base of Surprise mountain and about a mile easterly from Davis bay. The group is reached by travelling the Vananda–Iron Mines wagon-road to its junction with the road from Kirk lake; thence westerly about a mile to the *Silver Tip*, *Nancy Bell*, and *Thyee* mineral claims, which adjoin each other, except that there is a small land lot (No. 45) between the *Silver Tip* and *Thyee* mineral claims. The *Thyee* claim is north-westerly from the *Silver Tip* and the *Nancy Bell* southerly from the *Silver Tip*.

Geology.—The country-rock on the *Nancy Bell* group is porphyrite, which contacts with the Marble Bay limestone about a mile easterly from the *Silver Tip* and *Nancy Bell* claims. According to McConnell's geological map of Texada island, the porphyrite country-rock occurs in a vast mass covering all of the area northerly from Welcome bay to Crescent bay and easterly beyond Spectacle lake and Priest lake to the west side of Emily lake. In this portion of Texada island, especially on the *Nancy Bell* group, occurs a network of quartz veins and silicified fissure-zones which cut the porphyrite country-rock.

Ore-deposits.—The ore-deposits on the *Nancy Bell* group occur as quartz veins in one of the fissure-zones described by McConnell. These veins are quite numerous, they vary in width from 6 inches to 3 feet, and appear to be confined to one wide fissure-zone which strikes in a general north-westerly direction, but sometimes the strike of some of the quartz veins varies from north-westerly to westerly. The fissure-zone is apparently continuous for several hundred feet, extending through the entire group of mineral claims.

The development-work had not been sufficient up to the date of the examination to determine many material facts relative to the length of the various quartz veins or the depth to which they maintained continuity. The dips vary from 64° to the southerly to almost vertical. The gangue is quartz; the walls are well defined, with gouge usually on both walls and always on one.

The mineralization of the vein-filler is very similar in all of the quartz veins, being made up of iron pyrite, galena, zinc-blende, and some free gold.

Samples and Assays.—Several samples were taken from the several open-cuts, but the shafts could not be sampled owing to the quantity of water in them. The samples assayed as follows:—No. 1: Gold, 0.24 oz.; silver, 0.8 oz. No. 2: Gold, 0.4 oz.; silver, 3.5 oz.; zinc, 13 per cent. No. 3: Gold, 1.4 oz.; silver, 0.6 oz.; zinc, 0.5 per cent. No. 4: Gold, 0.82 oz.; silver, 0.4 oz.; zinc, 0.5 per cent.; copper, 1.2 per cent. No. 5: Gold, 0.4 oz.; silver, 0.04 oz.; zinc, 0.5 per cent.

Since taking the above-mentioned samples the writer is advised by Mr. Lee, the superintendent, that in extending the development-work on the *Nancy Bell* mineral claim, assay results

from his samples show higher values in gold than the samples taken at the time of the examination on which this report is based.

Development-work.—Since resuming work on the *Nancy Bell* group, up to the time of the examination, the work done had been principally prospecting along the strike of the fissure-zone from near the easterly end of the *Nancy Bell* claim to the north-westerly end of the *Thyee* claim. There are seven open-cuts varying from about 10 to 18 feet long, a crosscut adit 60 feet long, and several prospect-holes, each about 6 to 8 feet deep. Since the examination was made the writer is advised that work has been continued and a shaft sunk on the *Nancy Bell* claim.

Sentinel Group. This group, which was examined on May 31st, 1921, contains two mineral claims—the *Sentinel* and *Red Wing*—and is owned by Robert Swan, of Vananda. The *Sentinel* group is near the centre of Texada island, a short distance southerly from the Vananda–Gillies Bay wagon-road and northerly from Paxton lake.

Geology.—The country-rock on the *Sentinel* group is crystalline limestone, classified by McConnell as "Marble Bay" limestone, but the contact between that rock and porphyrite is in the near vicinity. The limestone is very much fissured and is traversed occasionally by diorite-porphyrite dykes.

Ore-deposits.—McConnell refers to the ore-deposits on the *Sentinel* group in the following language in Memoir No. 58, "Texada Island, B.C.," published by Canada Department of Mines, Geological Survey, 1914: "The mineral-deposits at the *Sentinel* differ from the ordinary types prevalent on the island. They consist of iron and copper pyrites, galena, tetrahedrite, and blend in grains, small aggregates, and veinlets scattered irregularly in small quantities through a wide band of the fissured and broken limestone. The ordinary contact-metamorphic minerals, with the exception of calcite and quartz, are almost entirely absent."

QUADRA ISLAND SECTION.

In the Quadra Island section of the Nanaimo Mining Division there has been but little activity during 1921. The expected resumption of development-work and shipments from the *Ingersoll* group of Crown-granted mineral claims were postponed, as was also the further development of the groups near Bold point, on the easterly side of the island, and Granite bay, on the westerly side. In fact, the only activity was in the vicinity of Deep Water bay, on the westerly side of the island, and Heriot bay, on the easterly side. The *Wanderer* group near Deep Water bay and the *Dawn* group near Heriot bay were examined on June 17th and 19th, and as these have never before been reported on, the following reports are included here:—

Wanderer Group. This group contains the *Wanderer* and *Prospector* mineral claims, owned by Albert Ross and Edward Hamilton; address, Granite Bay, Quadra Island. The group is about 1¼ miles easterly from Deep Water bay, near the head of a small creek which has a very steep fall and flows between high, almost precipitous, banks. Deep Water bay is a short distance northerly from Seymour narrows, where navigation is extremely hazardous for launches and small boats because of the rapid flow of the tides, the tide-rips, and whirlpools. In Deep Water bay there is fairly good shelter for light-draught vessels, as there also is in the other harbours on the westerly coast of Quadra island, such as Granite bay, Gowland harbour, and Quathiaski cove. On the easterly coast of Quadra island the safest shelter is in Heriot bay, but there is also fairly good shelter for small boats in the cove near Bold point and in Hyacinth bay.

The *Wanderer* group of mineral claims is at present reached by the wagon-road (old logging-railway) from Granite bay about 3 miles long; then by trail about 3 miles, there being no trail from Deep Water bay. The writer walked to the groups from Deep Water bay through timber in order to observe the feasibility of constructing a trail by that route, about 1¼ miles long, and so avoid travelling the route from Granite bay, about 6 miles long, but very much easier travelling.

Geology.—The country-rock in the near vicinity of the *Wanderer* group is the volcanic rock typical of the formation of the greater part of Quadra island, but the limestone-belt, which is of considerable width and is continuous across the island from Open bay, on the easterly side, to near Granite bay, on the westerly, contacts with the volcanics not a great distance from the ore-body on the *Wanderer* group.

Ore-deposits.—Copper-sulphide ore occurs on the *Wanderer* mineral claim, on which all the development-work has been so far done, in a fissure in a shear-zone in the volcanics. The

mineralization is principally chalcopyrite, associated with which is chalcocite and bornite. The gangue is chiefly quartz. The vein which carries the ore is quite persistent, although it is narrow, but the grade of the ore averages so well that it is possible that a comparatively small mine having commercial value might be developed.

Samples and Assays.—A sample of float from a rock-slide below the mine-workings assayed: Gold, trace; silver, 1.8 oz.; copper, 19 per cent. Another sample, a grab from a small dump at the portal of the drift-adit, assayed: Gold, trace; silver, 1.8 oz.; copper, 15.5 per cent.

Development-work.—The development-work has all been done on the *Wanderer* claim and consists of a drift-adit about 155 feet long, with two short crosscuts and a raise from the adit.

Dawn Group.

This group consists of the *Dawn* and *Rose* mineral claims, owned by Warren Teeter and Fred Bucher; address, Heriot Bay. The group is about a mile south-westerly from the Heriot Bay Hotel, near the shore, a short distance from the entrance of Hyacinth bay. The claims are reached by a wagon-road from the Heriot Bay Hotel. This road is the main highway across Quadra island, connecting Heriot bay on the easterly side with Gowland harbour and Quathiaski cove on the westerly side.

Geology.—The country-rock in the vicinity of the *Dawn* group is volcanic, typical of the southerly section of the island between the easterly and westerly coasts. The volcanic rock is very much sheared and fissured and presents favourable conditions for the occurrence of ore-deposits. The "Open Bay" limestone-belt contacts with the volcanics on this side of Quadra island at no great distance from the *Dawn* group, but it is doubtful if contact metamorphism has extended to the rocks on that group.

Ore-deposits.—The ore-deposit on the *Dawn* group occurs as a gash-vein filled with quartz mineralized with chalcopyrite, iron pyrite, and a little galena. The quartz vein where exposed by development-work is about 3 feet wide, with considerable gouge on the foot-wall side. The vein strikes north (mag.) and dips 85° to the east (mag.).

Samples and Assays.—Three samples were taken, two of which were said to have come from near the bottom of a shaft, full of water at the time of the examination, and the third was from sorted ore on a small dump at the collar of the same shaft. Sample No. 1 assayed: Gold, trace; silver, 0.8 oz.; copper, 4.4 per cent. Sample No. 2 assayed: Gold, trace; silver, trace; copper, 0.2 per cent. Sample No. 3 (dump) assayed: Gold, trace; silver, 0.8 oz.; copper, 10.9 per cent.

Development-work.—There are two shafts on the *Dawn* mineral claim, each said to be about 18 feet deep, but being full of water at the time of the examination could not be examined. There is also a long open-cut approach to the collar of one of the shafts.

VANCOUVER MINING DIVISION.

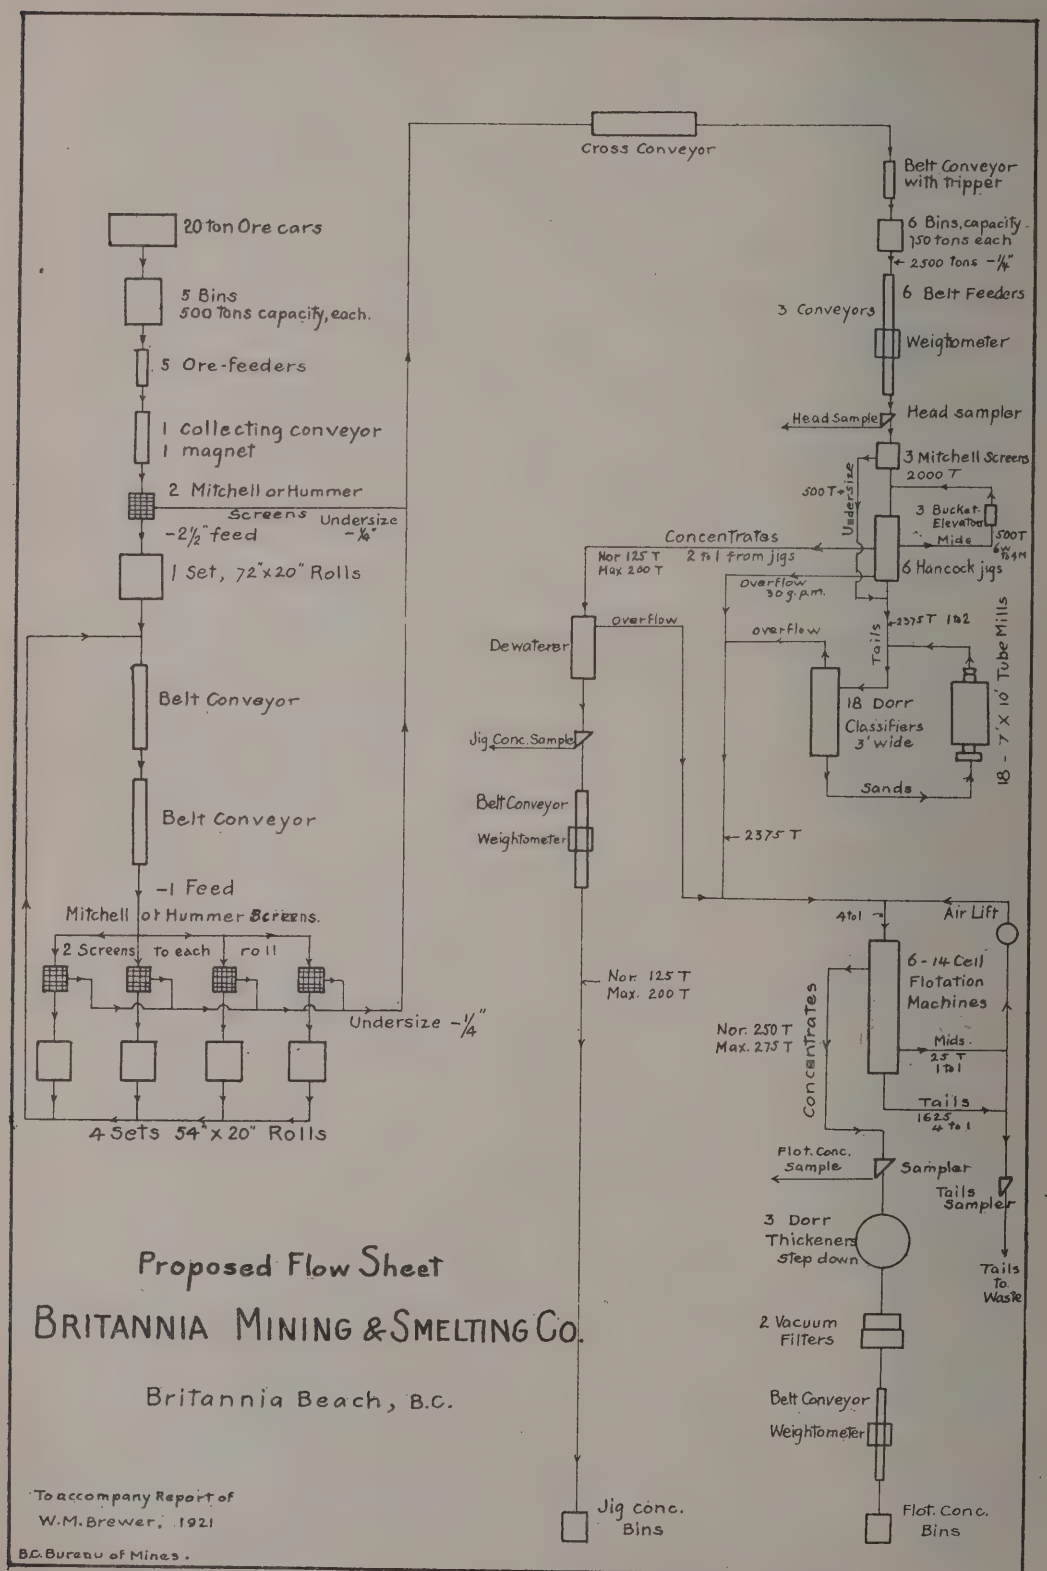
In the Vancouver Mining Division the development-work done during 1921 has been confined almost exclusively to that done by the Britannia Mining and Smelting Company on the *Britannia* mine, also by D. McKinnon, D. McCallum, and O. W. Rafuse on Ray creek, a tributary of the Stawamus river, and by J. Habrich on the Indian river.

The Britannia Company has kept about 250 men employed in extending the development-work in the mine and blocking out available ore. This work has resulted in largely increasing the tonnage of ore in sight, as well as exposing bodies of ore carrying very much higher values in copper than the usual run of mine ore heretofore worked.

The development-work done on Ray creek during the past year has resulted in determining the occurrence of what may be termed as the pay-shoot in the wide zone of schist. Samples taken at the time an examination was made by the writer early in September assayed from 0.1 to 6.8 per cent. in copper.

Britannia Mining and Smelting Co.

Early in February, 1922, the announcement was made that E. J. Donohue, who succeeded J. H. Moodie as general manager, had resigned that position, and that C. P. Browning, who has been superintendent of the mines of the company for several years, had been appointed general manager. While congratulating Mr. Browning on his well-deserved promotion and wishing him every success in the future, the writer desires to express his hearty appreciation of the many kindnesses and courtesies extended to him, both in his official position and personally, by Mr. Donohue, also to extend to him the sincere wish that he may enjoy health, happiness, and prosperity for many years to come.



Proposed Flow Sheet

BRITANNIA MINING & SMELTING CO.

Britannia Beach, B.C.

To accompany Report of W.M. Brewer, 1921

B.C. Bureau of Mines.

Since the concentrating-mill at Britannia Beach was destroyed by fire in 1921 the management has been busily engaged in making arrangements for rebuilding. Fred Bradley, of the firm of Bradley, Bruff & Labarthe, of San Francisco, was consulted with regard to a design for a new mill to replace the one destroyed by fire, with the result that contracts have been entered into with the Canadian Northwest Steel Company for building and equipping a plant having a capacity to treat 2,500 tons of ore daily, the flow-sheet of which is reproduced in this report. The building will be constructed of steel and concrete throughout and thereby be absolutely fire-proof.

Flow-sheet.—The upper floor of the new mill will be at a slightly lower elevation than the portal of the main haulage-adit, or about 250 feet above sea-level, known in the mine as the 4,100-foot level, it being about that distance vertically below the outcroppings on the *Fairview* mineral claim, from which the levels in the mine are numbered, the outcrop being zero. This main haulage-adit is about 4,900 feet long, 13 feet wide by 9 feet high, and is connected with the mine-workings on the 2,700-foot level by an incline rock-raise on a 65° slope, 1,488 feet high. This raise was finished in November last, so that when the new mill is completed everything is in readiness for haulage operations by this route, which will supplant the present incline tramway from the 2,700-foot level to the ore-bunkers at Britannia Beach.

The new mill is designed so that the ore from the mine, broken on the crusher level in the mine to a 2½-inch ring size, will be hauled in cars of 20 tons capacity through the main haulage-adit and delivered into ore-bins on the top story of the mill, where five bins, each having a capacity of 500 tons, will receive the broken ore. From these bins the ore passes through feeders to a collecting-conveyor equipped with a magnet and on to two Hummer screens, from which the undersize, ¼ inch or less, is carried to the lower story of the mill, and by a cross-conveyor to a belt-conveyor equipped with a tripper into five ore-bins, each having a capacity of 750 tons. From these bins the ore is carried by belt-conveyors to a weightometer, and from it into an automatic sampler. From the sampler the ore passes on to three Hummer screens, from which the undersize passes into Dorr classifiers, of which there are eighteen. The oversize from the Hummer screens passes into six Hancock jigs, from which the concentrates are discharged into a dewaterer, from there to an automatic sampler, which discharges the discard on to a belt-conveyor connecting with a weightometer, from which the concentrates are carried to the jig concentrates-bin in the mill building ready for shipment.

Of the undersized from the first set of Hummer screens which passes into the Dorr classifiers, the sands are discharged into eighteen tube-mills, each 7 by 10 feet, and from these mills are returned to the Dorr classifiers, the overflow from which, together with the overflow from the dewaterer following the jigs, as well as from the jigs, is conveyed to the flotation-cells. From these cells three products are made—concentrates, middlings, and tailings. The concentrates are conveyed to an automatic sampler, from that into three Dorr thickeners; thence into two vacuum-filters, which discharge on to a belt-conveyor connecting with a weightometer and conveyed to the flotation concentrates-bin in the mill ready for shipment; the middlings discharged from flotation-cells are conveyed to an air-lift and returned to the cells for further treatment; the tailings from the cells are conveyed to an automatic sampler, sampled, and discharged to waste-dump.

Returning to the top story of the mill to the Hummer screens, from which the undersize product has just been followed through the course of treatment to the shipping-bins, in order to describe the treatment accorded to the oversize feed discharged from the Hummer screens, it is found that it passes into a set of 72-inch by 20-inch rolls; then on to belt-conveyors, by which it is conveyed to Hummer screens, from which the undersize is conveyed to the lower story of the mill, where it is treated in the same manner as the undersize from the first-mentioned Hummer screens. The oversize from the second set of Hummer screens is conveyed to four sets of 54- by 20-inch rolls, from which the product is carried back to the belt-conveyors which follow the set of 72- by 20-inch rolls.

The bunkers on the shipping-wharf that have been used in the past from which to load concentrates into vessels are to be abandoned, and in their place the jig and flotation concentrates-bins in the mill will be used for storage-bins, which will be connected with the hold of a vessel at the wharf by a belt-conveyor about 2,000 feet long. This arrangement removes all danger from fire to the wharf bunkers, which has always been a source of anxiety in the past to the management.

At the Britannia Beach camp arrangements are being made to rebuild the residences and other buildings destroyed by the flood on a new site where the ground-level is so much higher than the old site that there will be absolutely no danger from a recurrence of any flood from such high water as occurred in October last. The culvert and fill on the electric railway across Britannia creek is being replaced by a steel suspension bridge, and no effort or expense is being spared by the company to avert danger in every way possible to conform with the "safety-first" policy.

In this respect the management has gone so far as to abandon nearly twenty buildings, including some large bunk and cook houses, at the 2,200-foot level camp, which was built to take the place of the old original camp on the 1,000-foot level, because there was a possibility that under aggravated conditions a rock-slide might occur which would endanger some of the buildings and mean disaster to the occupants.

During 1921 the operations at the mine have been confined almost entirely to development-work and the installation of improved ore-crushing machinery on the 1,700-foot level of greater capacity than has been employed in the past. In order to facilitate this installation a drift has been driven on a 30° slope 186 feet long from the 1,800-foot level to the 1,700-foot level, about 100 feet higher than the 1,800-foot level. The levels in the Britannia are numbered from the surface outcrop, 4,350 feet above sea-level, downward to the 4,100-foot level, which is about the same level as the roof of the mill building at Britannia Beach, about 2 miles in an air-line westerly from the open-cut on the *Fairview* mine.

Heretofore the ore-crushers have been operated on the 1,800-foot level, but in future there will be on the 1,700-foot level the 24 by 36 jaw-crusher formerly on the 1,800-foot level, also a 7½ K. gyratory crusher, while on the 1,800-foot level a new gyratory crusher of the same type and size will occupy the former position of the jaw-crusher. This arrangement, which necessitated the excavation of a large crusher-chamber on the 1,700-foot level, will afford a 2-stage preliminary crushing of the ore to 2½-inch ring previous to its transportation from the mine to the mill.

Another improvement in connection with the gravity system of handling ore through rock-raises has been the erection of a heavy reinforced concrete bulk-head in the main 68 ore-raise. This bulk-head directs the ore to the crushers, which discharge the crushed product into the ore-raise below the bulk-head.

The development-work done during 1921 was principally on the *Victoria* section of the property, easterly from the *Fairview* and *Empress* sections, where a newly discovered ore-body was developed. With regard to this ore-body, it is interesting to note that its discovery was one of the results of the geological examination made by Dr. S. J. Schofield, of the Geological Survey of Canada, during the seasons of 1919 and 1920. In accordance with his advice, Mr. Moodie, the then general manager, undertook prospecting with diamond-drills in ground that had previously been considered as practically barren. The result was that an apparently extensive body of copper-sulphide ore was proved. Samples from this, when assayed, showed higher average values than had before been found in the sections of the Britannia mine that had been worked since operations began. The ore-body occurs on and below a level corresponding with the 1,900-foot level in the main workings, and considerably lower than the ore-bodies in those workings have yet been developed.

In detail the development-work done in the mine during 1921, nearly all of which was on the *Victoria* section, has been as follows: Drifts, 1,909 feet; crosscuts, 1,027 feet; raises, 3,194 feet; winzes, 118 feet; giving a total of 6,248 feet. No diamond-drilling has been done on the property during the past year.

A winze is being sunk from the 1,900-foot level on the *Victoria* section, through which ore from the levels below will be hoisted and delivered into buckets on an aerial tram, by which it will be transported to the portal of the adit on the 1,600-foot level in the *Empress* section, and from there transported to the top of the ore or rock raise on the 2,700-foot level, down which it will fall into bunkers in the main haulage-adit on the 4,100-foot level.

A sawmill with capacity of 30,000 feet B.M. daily has been built near the entrance to the *Victoria* section for cutting and shaping mine-timbers. A 3-story bunk-house, 30 by 100 feet, has been built and a dry-house, 25 by 40 feet, for the accommodation of the miners working in that section.

Shipments.—The only shipments made during 1921 were from the bunkers at Britannia Beach, the product on hand at the close of 1920. These shipments were made to the Tacoma

smelter, as follows: Tons of ore and concentrates shipped, 47,385 tons; product, 646 oz. gold, 7,943 oz. silver, and 1,411,376 lb. copper.

Stawamus River Section.

Bruce and Radiant Groups.

The following report describes the geography, geology, ore-deposits, development-work, samples and assay values of the sulphide ores which occur in a wide zone of siliceous schists crosscut by Ray and Little Ray creeks, tributaries of the Stawamus river. This zone of schists is evidently a remnant of one of the undestroyed roof-pendants that occur in the granodiorite intrusive batholith of the Coast range. It has been suggested that the zone is an extension of the Britannia belt, but apparently such a theory is not warranted, because a wide belt or zone of granodiorite occurs between the schists of the Britannia belt and those on Ray creek. It appears more probable that the Ray creek schist country-rock is an example of an isolated lens of considerable extent of a remnant of one of the undestroyed roof-pendants.

The schists are heavily mineralized with iron pyrites and some chalcopyrite, with the iron pyrites very much in excess of the chalcopyrite at the lower elevation; in fact, the pay-shoot appears to occur only at an elevation higher than about 2,000 feet and near the contact between the schists and granodiorite. The encouraging feature regarding the groups of mineral claims considered in the following report is the fact that the observations of Camsell and other geologists and engineers as to the occurrence of remnants of undestroyed lenses of roof-pendants made up of more or less metamorphosed sedimentary rocks in the Coast Range batholith are not only proving correct, but the occurrences are much more numerous and extensive than the reports of those authorities indicated some years ago.

Prospectors should be interested in these facts, but bear in mind that in order to find ore of a commercial value it is necessary to climb to the higher elevations and search for contacts between the granodiorite and altered sedimentary rocks. It also appears that the higher values are associated with quartz gangue, for while the iron pyrites occurs in great abundance in the schists, the material carries very little chalcopyrite, except when the gangue is almost entirely of massive quartz, in which the structure has a tendency towards the ribbon or banded variety.

Area and Title.—The *Radiant* group contains six mineral claims, or about 300 acres; the *Contact* group contains four claims, or about 200 acres; and the *Bruce* group also contains four claims, or about 200 acres. The *Radiant* and *Contact* groups of mineral claims are owned by O. W. Rafuse and associates, of Vancouver. The *Bruce* group is owned by D. McCallum, of Squamish; Dan McKinnon and A. H. McKinnon, of Vancouver.

Geography.—The *Radiant* group of mineral claims is in the mountains paralleling the Stawamus river on the northerly side of the river; the *Bruce* group adjoins the *Radiant* group on the north-easterly side and its southerly boundary is on the south side of Ray creek, a torrential stream emptying into the Stawamus river about 5 miles in an easterly direction from the mouth of that river on the east side of the head of Howe sound near Squamish, the western terminal of the Pacific Great Eastern Railway; the *Contact* group adjoins the *Bruce* group on the easterly side and extends in an easterly direction towards the head of Ray creek and the summit of the mountain range in which that creek has its source.

The *Radiant*, *Bruce*, and *Contact* groups of mineral claims are reached by pack-horse trails from Squamish, about 2½ miles, to near the dam of the Squamish water-power and electric-light plant on the Stawamus river, where a foot-trail branches towards the south-east into the mountains for a distance of about 3 miles to beyond the cabin on the *Radiant* group, and to a point on Little Ray creek where work is done on the *Bruce No. 2* mineral claim.

Little Ray creek is a mountain stream with a precipitous fall from its source near the summit of the range of mountains, from which it flows in a westerly direction across the *Bruce No. 2* and *No. 3* claims, joining the main Ray creek near the westerly boundary of the *Bruce No. 3* mineral claim.

The mountain range to the easterly from the groups of mineral claims rises to an elevation of about 5,000 feet above sea-level, with some peaks reaching an altitude of over 6,000 feet. The altitude of the prospecting-work done on the *Bruce* and *Contact* groups is about 3,000 feet above sea-level.

Geology.—There is an exceptionally good opportunity afforded on the *Radiant*, *Bruce*, and *Contact* groups of mineral claims to study the geology of that section, for the reason that Ray

creek practically crosscuts the rock formation for a distance of about a mile. The creek flows generally from east to west, while the strike of the bands of argillites, quartzites, and talc-schists exposed in both of the steep banks of the creek is north-westerly and dip varying from about 65° towards south-west to vertical.

The granodiorite of the Coast Range batholith is exposed in the narrow valley of the Stawamus river, and the country-rock for about half a mile up Ray creek from its junction with the Stawamus is made up of similar rock, but at this point there is a well-defined contact between the granodiorite and a band of sedimentaries in which argillite, quartzite, and a talcose schist predominate. As the bed of the creek is followed up towards its head in high mountains to the east, the band of sedimentaries is crosscut to a point where another contact occurs near the head of Ray creek between the sedimentaries and granodiorite.

It is noticeable that at the lower elevation the schist is extremely talcose, but as higher elevations are reached there occur more quartz and quartzite in the country-rock, and the schist becomes more siliceous and quartz kidneys often occur as inclusions in the schist. It is in the latter class of country-rock that mineralization is the most pronounced.

Ore-deposits.—Mineralization occurs generally in the bands of schist. This mineralization at the lower elevations consists entirely of iron pyrite usually disseminated through the schist gangue in small particles, but sometimes occurring massive in lumps of considerable size of practically solid iron sulphide. Several samples assayed at various times of this variety of the mineralization have failed to show any values except iron and sulphur.

Owing to the great width of mineralized schist crosscut by Ray creek, intensive surface prospecting has been carried on for the past three years, and it has been proven that at higher elevations near the head of Ray creek, approaching the contact on the north-easterly side of the sedimentary belt, the mineralization includes chalcopyrite associated with iron pyrites, some samples of which carry satisfactory values in copper.

The extent of the deposits of ore carrying copper values is as yet undetermined; apparently there are several belts of schist which carry the mineral and occur within a width of about 600 feet. In each of these various belts there appears to be a concentration of the mineralization varying in width. Most of the mineralized belts can be superficially examined from the creek-bed, but as the banks for the most part are so precipitous as to form a canyon which can only be travelled during extreme low water, it is impossible to satisfactorily determine the extent of the ore-bodies except by actual work of drifting and crosscutting.

The occurrence of the mineralization in which chalcopyrite in appreciable quantity occurs associated with iron pyrites are found on the *Bruce No. 2* and *Bruce No. 1* claims of the *Bruce* group, also on the *Dorothy* claim of the *Contact* group.

Samples and Assays.—Six samples were taken from the *Dorothy* claim, one from the *Bruce No. 1*, and one from the *Bruce No. 2* claims, which assayed as follows:—No. 1, *Dorothy* claim: Gold, *nil;* silver, *nil;* copper, 0.1 per cent. No. 2, *Dorothy* claim: Gold, trace; silver, trace; copper, 0.5 per cent. No. 3, *Dorothy* claim: Gold, trace; silver, trace; copper, 5.6 per cent. No. 4, *Dorothy* claim: Gold, trace; silver, 1.6 oz.; copper, 6.8 per cent. No. 5, *Dorothy* claim: Gold, trace; silver, 0.8 oz.; copper, 3.5 per cent. No. 6, *Dorothy* claim: Gold, trace; silver, trace; copper, 2 per cent. No. 7, *Bruce No. 1* claim: Gold, trace; silver, trace; copper, 0.4 per cent. No. 8, *Bruce No. 2* claim: Gold, trace; silver, trace; copper, 1 per cent.

Development-work.—The development-work on the *Radiant* group consists of a series of open-cuts for prospecting; these open-cuts vary in size; one of the largest is 26 feet long, 5 feet wide, and from 6 to 12 feet deep.

The development-work on the *Bruce* group consists of two adits and several open-cuts in the banks of Ray and Little Ray creeks. One adit on the *Bruce No. 3* claim is 36 feet long as a drift, from which there is a crosscut 12 feet long; the other adit on the *Bruce No. 2* claim is 25 feet long as a drift.

The development-work on the *Contact* group is confined to several open-cuts on the *Dorothy* claim. These cuts have been made into the steep banks of Ray creeks on both sides of the creek, in an effort to determine the location of the pay-shoots, also to gain some idea of the extent of the mineralization.

NEW WESTMINSTER MINING DIVISION.

The mining industry in the New Westminster Mining Division during 1921 has not shown the activity which was anticipated at the beginning of the year, when it was expected that the

Guggenheim interests would complete negotiations for the *Lucky Four* group of mineral claims in the Cheam range of mountains, which forms the watershed between the Fraser and Chilliwack rivers. The negotiations were cancelled, and consequently the development-work on that group has not been carried on to any great extent during 1921.

Some prospecting was done in the Fire Mountain section, near the head of Harrison lake, on some of the gold-bearing quartz veins in the vicinity of the old *Money Spinner* mineral claim, which was prominent in 1897 and 1898. It is the intention of the syndicate, the writer is informed, to continue the work during 1922.

Indian River Section.

Indian River section of the New Westminster Mining Division was first prospected about 1910, when S. A. Habrich and partner were engaged in prospecting on the headwaters and located the *Belle* group of mineral claims. It was not until 1912 or 1913 that the section was given much more attention. Then several other prospectors staked mineral claims in the mountains paralleling both sides of the river wherever outcroppings indicated the occurrence of deposits of copper-sulphide ores.

Habrich figured that the *Belle* group of mineral claims was located on an extension of the Britannia mineralized zone and in the same geologic formation, but later prospecting showed indications that the Britannia belt was separated from the mineralized zone in which the *Belle* group is situated by a belt of granodiorite on the west of the last-named group.

The rocks occurring on the *Belle* group, as classified by Chas. Camsell,* "consist of argillite, greenstone, and limestone that is metamorphosed by the development in it of much quartz and biotite."

Prospecting later than 1913 showed that apparently an extension of the Britannia mineralized zone did occur in the mountains adjacent to Indian river a few miles south-easterly from the *Belle* group, and investigations made by mining engineers in the employ of the Britannia Mining and Smelting Company resulted in the purchase by that company of the several groups of mineral claims on Indian river shown in the accompanying sketch-map.

Similar geologic formations to those occurring in the Britannia mineralized zone occur in a zone on the several groups shown on the map, but there is a presumably wide belt of granodiorite separating the known eastern boundary of the Britannia belt from the Indian River mineralized zone, although but little is really known of that mountainous section in the vicinity of Loch Lomond and the headwaters of the West and East forks of Seymour creek.

Geography.—Indian river has its source in the mountains about 12 miles south-easterly from Squamish, the ocean terminus of the Pacific Great Eastern Railway at the head of Howe sound, and about 4 miles north-easterly from Loch Lomond. The course of the river is south-easterly to its mouth at the head of the North arm of Burrard inlet. Its total length is about 20 miles. The river occupies a heavily wooded valley in the Coast range of mountains, the peaks of which rise to elevations of from 3,000 to 4,000 feet above sea-level on either side.

The groups of mineral claims on Indian river are reached either from Squamish by way of the Squamish–Stawamus pack-horse trail to the divide and down Indian river, or by launch from Vancouver to the head of the North arm of Burrard inlet to the terminus of an old wagon-road 6 miles long; then pack-horse trail up the river to the cabin on the *Caledonian No. 1* mineral claim, distant 11 miles from the mouth of the river. On this mineral claim occurs the south-eastern boundary, so far as known at present, of the mineralized zone.

Geology.—The geology of the Indian River section is described by Chas. Camsell* when he made a trip from Squamish to the mouth of Indian river and examined the *Belle*, *Bulliondale*, *London*, and *Roy* groups of mineral claims. Later in 1917 the same trip and examinations were made by the writer of this report, whose report was published in the Annual Report of the Minister of Mines for that year, pages 275–278.

Development-work.—Since 1917 the Britannia Mining and Smelting Company has acquired by purchase and Crown-granted all of the groups of mineral claims referred to, except the *Belle*, *Bulliondale*, and *London* groups. The company has since then carried out considerable systematic development-work on several of the claims in order to determine important data relative to the extent of the mineralized zone and the values carried by the deposits of copper-sulphide ores that occur in the zone.

---

* Camsell, C., Geol. Surv., Can., Sum. Rept., 1917, pages 23B to 25B.

VICTORIA MINING DIVISION.

About the only work of any importance that was performed in the Victoria Mining Division during 1921 was that done on the *Gabbro* group of mineral claims on Jordan river, about 40 miles from Victoria, and the work done by W. G. Dickenson on the deposits of talc on Wolf creek, a tributary of the Sooke river.

Gabbro Group.

This group contains twenty-three mineral claims and adjoins the *Sunloch* group. The *Gabbro* group extends on both sides of the Jordan river and is located down the river from the *Sunloch* group. During 1921 prospecting-work done on the *Vulcan No. 2* and *No. 3* mineral claims of the group exposed a body of pyrrhotite ore in what is known as the Stewart ore-zone, one sample from which assayed: Copper, 2.3 per cent.; nickel, 0.58 per cent.; and another, nickel 0.45 per cent. This body of ore has a maximum width of 30 feet and minimum of 12 feet, as exposed by four open-cuts in the mountain-side about 250 feet above the Sunloch Company's tramway. Nickeliferous ore is also found in pyrrhotite on the Winkler ore-zone in the south-east corner of the *Vulcan No. 2* mineral claim. These ore-zones occur in the gabbro country-rock near the contact between it and the Metchosin volcanics, in which the ore-bodies on the adjoining *Sunloch* group occur.

On the *Vulcan No. 6* claim of the *Gabbro* group a body of copper-sulphide ore of commercial grade is exposed in an open crosscut 25 feet long, 8 to 10 feet deep by 4 feet wide. The ore-body as shown in the cut is 6 feet wide.

On the *Vulcan No. 5* claim of the *Gabbro* group a body of copper-sulphide ore averaging about 3 per cent. in copper is exposed by open-cuts. This body of ore is apparently an extension of the Cave ore-zone, which occurs on the adjoining *Sunloch* group. The ore-body has been opened up on the river-level, where the ore is about 10 feet wide; it has also been opened up on the mountain-side about 200 feet above the river, where the ore is about 9 feet wide.

Several open-cuts have been made on the *Hornet Fraction* and *Cliff Fraction* claims of the *Gabbro* group, as well as on the Turnbull ore-zone, which occurs in basalt country-rock south-westerly from the Cave ore-zone on the *Sunloch* group.

During 1921 a commodious log cabin was built on the *Vulcan No. 6* claim of the *Gabbro* group. This is on the mountain-side about 500 or 600 feet higher than the bridge across the Jordan river on the *Sunloch* group of mineral claims.

OCHRE-DEPOSIT ON DEMANIEL CREEK.

On October 9th and 10th, 1921, the writer examined a deposit of yellow ochreous clay or impure bog-iron ore on Demaniel and Stony creeks, in the Otter district of the Victoria Mining Division, near the Sooke Post-office, about 3 miles westerly from the track of the Canadian National Railway and 26 miles from Victoria by auto-road.

The property is made up of the *Florence* mineral claim, owned by Dan. Campbell, of Victoria, and staked on Demaniel creek at a point about half a mile southerly from Young lake, and where the creek flows from south-west (mag.) to north-east and within a few yards of the Victoria–Jordan River auto-road, also a land lot traversed by Stony creek, which flows into Demaniel creek about three-quarters of a mile north-east from the deposit on Demaniel.

The deposit was examined by Chas. H. Clapp about 1910 and is reported on in Memoir No. 13, "Southern Vancouver Island," Canada Geological Survey, 1912, page 198, under the heading "Pigments."

In his report Clapp says: "The deposit consists of a very fine-grained clay, with which is mixed fairly uniformly bog-iron ore or limonite. Limonite also occurs in small concretions. An analysis of a sample from the deposit showed the iron content to be 15.5 per cent. Near the surface the deposit contains angular fragments of the Metchosin volcanics, but these have doubtless been washed in by the Demaniel river during times of high water and they do not continue in depth. The material has been deposited during late Pleistocene or recent times in a bog which probably represented the end stage in the filling-up of one of the transient lakes which collected in the hollows of the drift-mantel at the close of the period of glacial occupation. The material could readily be washed and purified, and the product, although valueless as an iron ore on account of its low iron content, would make a good base for coloured paints."

DEMANIEL CREEK DEPOSIT.

The examination made by the writer was mainly with a view of determining as far as possible from a superficial examination the probable or possible extent of the deposit or deposits.

As the development-work which had been done some time back in the bed of Demaniel creek has been obliterated, several holes were bored during the examination with an earth-boring auger into the outcroppings along the south-easterly bank of the creek, also the face of a bluff about 150 feet north-easterly from the discovery post was dug into to ascertain some data with regard to the continuity of the deposit in that direction. Samples of the ochreous clay were taken for the purpose of analysis.

In the bed of Demaniel creek and along the south-easterly bank the outcroppings of the deposit are continuous for about 300 feet in a south-westerly direction from the discovery post, and for an average width of about 40 feet, which width in places is apparently considerably greater, but the outcroppings are not exposed without a break; for example, in a pig-pen some 50 feet or so from the south-easterly bank of the creek and in the same direction the ochreous material outcrops, but is not exposed between the pig-pen and the discovery post, the surface there being covered by rocks and soil and no prospecting-work done.

About 100 feet north-easterly from the discovery post the course of the creek is deflected towards the east, the water flowing around a low bluff which is about 40 feet high. By digging into the almost vertical face of this bluff the ochreous material was exposed for a width of 40 feet, and was also exposed by a shallow hole dug on the flat at the top of the bluff about 20 feet back from its face, where the timber has been logged off.

From these data it is apparent that the strike of the deposit is north-easterly, with dip in a north-westerly (mag.) direction, but the exposures are not sufficiently opened up to determine the angle of the dip.

Holes bored into the outcroppings along the south-easterly bank of the creek during the examination showed that the thickness of the ochreous material exceeded 3 feet, with no change at that depth.

It is not possible in the present condition as to work to determine the tonnage in sight, but from the foregoing it will be seen that the probable or possible tonnage is quite considerable; ample, in fact, to warrant mining operations and guarantee a supply equal to any reasonable demand for some time to come.

Stony Creek Deposit.

On a small creek known as Stony creek, a tributary of Demaniel creek, into which it flows, about three-quarters of a mile in a north-easterly (mag.) direction from the outcroppings of the ochreous deposit exposed in that creek, similar outcroppings occur. These can be traced along the steep south-easterly bank of Stony creek for a considerable distance, striking in a north-easterly (mag.) direction, but no work has been done to determine any material facts as to extent in width or depth. Apparently the deposit on Stony creek may occur as paralleling that on Demaniel creek, or it may be found after systematic prospecting has been done that the first mentioned is an extension of last named. In any event it is evident that the Stony Creek occurrence will materially increase the quantity of ochreous material that can be easily mined and transported from the district.

The Stony Creek deposit occurs on Crown-granted land owned by Dan. Campbell, of Victoria, who also owns the deposit on Demaniel creek.

List of Samples, with Assay Results.

Nos. 1 and 2, from *Florence* mineral claim, taken from the south-eastern bank of Demaniel creek:—No. 1: Manganese, trace; iron oxide, 12.87 per cent.; silica, 35 per cent.; alumina, 32.73 per cent. No. 2: Manganese, trace; iron oxide, 17.2 per cent.; silica, 28.5 per cent.; alumina, 26.8 per cent.

No. 3, from *Florence* mineral claim, taken from the face of bluff outcrop, about 150 feet north-easterly (mag.) from the discovery post: Maganese, trace; iron oxide, 21.45 per cent.; silica, 26.5 per cent.; alumina, 38.55 per cent.

No. 4, from bank of Stony creek: Manganese, trace; iron oxide, 27.2 per cent.; silica, 28 per cent.; alumina, 31.2 per cent.

ALBERNI DISTRICT.

ALBERNI MINING DIVISION.

REPORT BY A. G. FREEZE, GOLD COMMISSIONER.

I have the honour to submit a brief annual report on mining in the Alberni Mining Division during the year ending December 31st, 1921.

Big J. Group.—This group of claims, situated 10 miles north-westerly from the head of Great Central lake, which was formerly held under bond by the Consolidated Mining and Smelting Company, Limited, of Trail, has reverted to the original owners, M. Tebo and J. A. Drinkwater. Nothing has been done on the group during the year except the annual assessment-work.

Monitor Group.—Nothing has been done on this group during the year.

W.W.W. Group.—This group, which has lain idle for a number of years, was purchased at tax sale last year by J. H. Davey, Jr., who has sold to a Mr. McLeod, who, I understand, intends to develop it during the coming year.

OFFICE STATISTICS—ALBERNI MINING DIVISION.

Mineral claims recorded	2
Certificates of work recorded	31
Free miners' certificates issued	40
Bills of sale recorded	3

Revenue.

Mining receipts, general	$150 25
Free miners' certificates	158 75
Total	$309 00

CLAYOQUOT MINING DIVISION.

REPORT OF WALTER DAWLEY, MINING RECORDER.

I have the honour to submit the annual report on mining operations in the Clayoquot Mining Division for the year ending December 31st, 1921.

Bear group of mineral claims, owned by Chas. Sundwell and situated on Elk river. Considerable work has been done on these claims this season.

The Woodworth property, owned by J. B. Woodworth and situated on Bear river. Work has been going on for several months installing a plant to treat on the property the ore which carries high values.

The Tidewater Copper Company, on Sidney inlet, is still closed down owing to the low price of copper.

Several placer leases have been staked at Wreck bay.

The annual assessment-work has been done on a number of claims, but there have been no shipments from any of the mines in the district.

OFFICE STATISTICS—CLAYOQUOT MINING DIVISION.

Mineral claims recorded	23
Certificates of work	14
Free miners' certificates issued	24
Transfers recorded	1
Powers of attorney recorded	4
Other receipts issued	3

Revenue.

Mining receipts	$105 75
Free miners' certificates	114 00
Total	$219 75

QUATSINO MINING DIVISION.

REPORT BY ED. EVENSON, MINING RECORDER.

I have the honour to submit the annual report on the mining operations in the Quatsino Mining Division for the year ending December 31st, 1921.

Except the regular assessment, no work has been done on mineral claims in Quatsino Mining Division this past year.

On the *Old Sport* group development-work has been confined to diamond-drilling 900 feet. It has been closed down since June, 1921.

On the *Millington* group, located at Spruce river, at the head of West arm, considerable prospecting-work has been done and the showing is very good; also a road has been built to the mine from the main road from Holberg.

On the *Seal* group, located 3 miles east of Holberg, on the south side of West arm, considerable prospecting-work was done this summer and the showing is very good.

OFFICE STATISTICS—QUATSINO MINING DIVISION.

Mineral claims recorded	23
Certificates of work	75
Powers of attorney and transfers	7
Certificates of improvements	14
Mining receipts	35
Free miners' certificates	62
Special free miners' certificates	1
Total revenue	$900 50

NANAIMO DISTRICT.

NANAIMO MINING DIVISION.

REPORT BY S. McB. SMITH, GOLD COMMISSIONER.

I have the honour to submit herewith the annual report on the mining operations in the Nanaimo Mining Division for the year ending December 31st, 1921.

During the year the mining industry in the Nanaimo Mining Division has not been as active as could be desired. There have been ten placer-mining leases granted to applicants in the north-western portion of Vancouver island in the vicinity of Cape Sutil, formerly known as Cape Commerell. There have also been several applications for placer-mining leases for areas situated in the vicinity of Cape Scott, north-western end of Vancouver island.

Active operations have been carried on at Lasqueti island by Henry Lee, managing director of the Lasqueti Mining Company.

Further prospecting operations have been carried on by the Paramount Mining Company on its groups of mineral claims on Myra and Price creeks, at the head of Buttle lake, Strathcona Park.

The Tatlayoko Lake Gold Mining Company has been engaged during the past year in sawing lumber and making preparations to erect a concentrating-mill on the company's property near the foot of Tatlayoko lake.

Wm. M. Brewer, Resident Engineer, has examined several properties during 1921, and I presume will give detailed descriptions in his annual report. Therefore it is only necessary for me to add the office statistics to this report, which are as follows:—

OFFICE STATISTICS—NANAIMO MINING DIVISION.

Mineral claims recorded	152
Certificates of work recorded	263
Bills of sale, etc., recorded	48
Free miners' certificates recorded	216

Revenue.

Free miners' certificates	$1,008 00
Mining receipts	2,490 20
Total	$3,498 20

VICTORIA DISTRICT.

VICTORIA MINING DIVISION.

Report by Herbert Stanton, Gold Commissioner.

The Resident Engineer, Wm. M. Brewer, having covered this Mining Division in his report, I beg to submit the office statistics for the year 1921.

Office Statistics—Victoria Mining Division.

Free miners' certificates issued	345
Free miners' certificates (special) issued	3
Mineral claims recorded	24
Placer claims recorded	1
Certificates of work recorded	47
Bills of sale recorded	36
Certificates of improvements issued	1

Revenue.

Free miners' certificates	$2,776 25
Mining receipts	554 43
Total	$3,330 68

VANCOUVER MINING DIVISION.

Report by A. P. Grant, Mining Recorder.

I have the honour to submit the following report of the mining operations in the Vancouver Mining Division for the year ending December 31st, 1921:—

The following is a list of the number of claims and the localities in which they are situated:—

Jervis inlet	2
Mill creek	3
Alta lake and Pacific Great Eastern Railway	19
Lynn creek	9
McCartney creek	2
Stawamus river	3
McNab creek	4
North arm	2
Salmon arm	7
Cypress creek	5
Total	56

The snow staying so late on the hills during the last year did not allow prospectors to get out as early as usual, so there were less claims recorded than for some years previously.

The development-work done on the *Attorney* group, situated on Howe sound, was simply the annual assessment-work. This work confirms the opinions of the owners that their properties are part of the *Britannia* formation. They are very heavily mineralized and all have copper.

C. M. Oliver, of the Bowena Mining Company, states that at the *Bowena* copper-mines, Bowen island, repairs to the compresser were made last May and a tramway for bringing in supplies of wood fuel built. A good supply of fuel was laid in and development-work continued up to the end of June. Since that time nothing further has been done, although the lessees of the property hope to resume operations, both mining and milling, as soon as the market price of copper has advanced to 15 cents a pound.

No work was done on the Snug Cove property during 1921, but the company expects to resume development-work early in 1922.

T. W. Lillie, part owner of the *Virgo* and *Jupiter* groups of twelve claims on the west bank of Britain river, Jervis inlet, states: "Work has been done on three different levels—namely, 2,000, 3,500, and 4,500 feet elevation. At the 2,000-foot level the lead is 50 feet in width, carrying gold, silver, lead, zinc, pyrrhotite, and copper. At the 3,500-foot level the lead is 200 feet in width, showing mineral in good quantities all the way across, consisting of copper, galena, gold, platinum, with less zinc. At the 4,500-foot level we have uncovered an 8-foot lead of a very fine grade of galena. The best assays we received were: Chalcopyrite, 17 per cent.; silver, $140; lead, $60; zinc, $40; gold, $18; platinum, $3. The copper also carries: Silver, 23 oz.; gold, $2.50; platinum, $3. We have a fairly good trail up to our claim, built by ourselves."

E. J. Donohue, general manager of the Britannia Mining and Smelting Company, Limited, states: "During the year 47,385 tons of ore was drawn from the mine. The development footages were as follows: Drifts, 1,909 feet; crosscuts, 1,027 feet; raises, 3,194 feet; winzes, 118 feet, which gives a total footage driven of 6,248. There was no diamond-drilling during the period.

"*Mining and Development Work.*—For the first three months of the year there were underground shrinkage stopes in operation, particularly on the 250-foot level. A drift 186 feet long was driven on a 30° slope from the 1,800- to the 1,700-foot level, at which point a crusher-chamber was enlarged for the installation of the 24 by 36 jaw-crusher previously operating on the 1,800-foot level, complementing a 7½ gyratory crusher. A new gyratory crusher, the same type and size as the one in place, is to be set up in the former position of the jaw-crusher. With the above installation it is arranged to give a 2-stage preliminary crushing to the ore, reducing same to 2½-ring before it leaves the mine. In order to bypass the ore through the jaw-crusher it has been necessary to place a heavy reinforced-concrete bulk-head in the Main 68 ore-raise, which directs the ore to the crusher, which in turn discharges its crushed product into the ore-raise below the bulk-head.

"Practically all the development-work done was in the *Victoria* section of the mine, east of the *Fairview* and *Empress*, opening a new body of ore. On the 1,900-foot level a winze is being sunk, through which the ore will be hoisted from the levels below. An aerial tramway is under construction to handle this ore from the *Victoria* to the portal of the 1,600-foot level of the *Empress*.

"Near the entrance to the *Victoria* mine there has been erected a 30,000-foot-capacity sawmill, from which timbers are handled directly to the workings. A 3-story, 30- by 100-foot bunkhouse and a 25 by 40 dry-house have been built to house and care for about sixty-five men.

"During the year the 1,500-foot raise from the 4,100-foot level (elevation top of mill-bins) to the 2,700-foot level (elevation head of incline) was holed through, and is now being put in shape to handle by gravity the total output of the mine, thus eliminating the incline railway as an ore-carrier. No ore is being drawn from the mine at the present time.

"No milling operations were conducted during the year, and on March 19th our Beach concentrator was destroyed by fire of an unknown origin. Shipment was, however, made during 1922 of the following tonnages to the Tacoma smelter, cleaning up the product which was on hand in our bunkers at the close of the year: Tons of ore and concentrates shipped, 6,502, containing 646 oz. gold, 8,362 oz. silver, and 1,476,395 lb. copper.

"Contract has recently been closed with the Canadian Northwest Steel Company for the erection of a 2,500-ton steel-mill to replace the one above mentioned, and it is our intention to install in this fire-proof building the most modern type of milling machinery, embodying equipment much larger than that formerly used. We hope to have the mill in operation during the fall of the present year."

As the details of the horrible accident occurring on October 28th through flood conditions are fresh in your mind, I will not incorporate same in this report.

J. H. Thompson informs me that during the past year his company has been shipping bog-iron ore from its mines near Mons to the gasworks at Tacoma and Seattle, and that arrangements have been completed to ship ore to other gas plants in the Coast States and this Province. This ore is being used as a purifier, and after severe tests and comparisons with other purifiers has been found a much better article.

Conuma River, Nootka Sound.

Powell Lake, Nanaimo M.D.

UNIVERSITY OF ILLINOIS LIBRARY

From the numerous inquiries made and the widespread interest being taken in mining matters here, the coming season promises to be a busy one among the miners all over the Province.

NEW WESTMINSTER MINING DIVISION.

Report by Irving Wintemute, Mining Recorder.

I have the honour to submit the following report of mining operations in the New Westminster Mining Division for the year ending December 31st, 1921:—

The mineral claims located and recorded during the year are situate in the following places throughout the New Westminster Mining Division: Harrison lake, 35; Jones creek, 8; Agassiz, 5; Pitt lake, 16; Chilliwack lake, 1; Lillooet river, 26.

There has been a slight increase in the number of claims recorded over the previous year, while the assessment-work recorded shows a considerable falling-off.

There have been no new developments in the district worthy of special report. Very little has been done beyond some prospecting in the vicinity of Harrison lake and also at Lillooet river and vicinity, where several new claims were located and recorded.

Prospecting for oil has been continued during the year by the Boundary Bay Oil Company, Limited, at Boundary bay, and the Empire Oil and Gas Company near Aldergrove. I am indebted to S. A. Thompson, manager of the Boundary Bay Oil Company, Limited, for the following report of the company's operations at Boundary bay:—

"The Boundary Bay Oil Company, Limited, was formed in 1918 for the purpose of sinking a well to test the Boundary Bay section for oil and natural gas. Prior to the starting of a deep test a number of shallow wells were sunk to gather information of the structural conditions existing. A location on Lot 578, New Westminster District, was decided on. This location is on the tidal flats of Boundary bay and being about 15 miles in a south-easterly direction from the city of Vancouver.

"During the year of 1920 a well was sunk to the depth of 2,473 feet and was finally abandoned owing to casing trouble. The geological conditions encountered were favourable and indicated that a deeper test should be put down on a location in the immediate vicinity.

"The 116-foot derrick used on well No. 1 was moved 65 feet and well No. 2 was started on the 5th day of April, 1921. At the time of making this report, January 25th, 1922, a 10-inch hole had been sunk to a depth of 3,831 feet.

"The conglomerates met at a depth of 2,150 feet evidently mark the lowest strata of the Pliocene, and the 36-foot limestone and marine shells thereafter entered by the drill evidently mark the upper strata of the Miocene. Shells of Lamellibranchs from this horizon appear to be the *Tellina (Angulus) producta* of Conrad, and a broken fragment of a larger shell appears to represent the *Spisula (Hemimactra) marylandica* of Dall.

"At a depth of 2,417 feet a sand carrying gas under considerable pressure was encountered. An analysis of the gas gave the following results:—

	Per Cent.
Paraffins (mainly methane)	85.2
Ethane	Trace.
Oxygen	3.2
Nitrogen	11.4
Carbon	None.
Carbon dioxide	Trace.

"The above results show that the sample submitted is chiefly natural gas mixed with about 14 per cent. of air.

"From 2,500 feet down to 3,831 feet was found a series of brown shales, blue shales, limestones, brown gumbo, gypsum, blue gumbo, black bituminous shales, steatite, shale and shells, chalk rock, yellow gumbo, sandy shales, and sandstone. Below the 3,700-foot horizon 130 feet of sandy shale and sandstone all carried gas under very high pressure, and also some oil of high gravity and of a paraffin base.

"The drilling equipment is composed of a No. 5 Union Tool rotary. The motive power is supplied by two horizontal tubular boilers (120 horse-power) connected with a 12- by 12-inch engine and two 12- by 6¾- by 12-inch mud-pumps."

INSPECTION OF MINES.

REPORT BY JAMES McGREGOR, CHIEF INSPECTOR.

I have the honour to submit my annual report as Chief Inspector of Mines for the Province for the year 1921.

Appended are the District Inspectors' reports on the condition of the mines in their respective districts in regard to safety and sanitation, the number of persons employed in and around the coal and metalliferous mines, the tonnage of coal mined, lists of fatal accidents and prosecutions, and the reports of the Instructors in Mine-rescue and First-aid Work.

PERSONNEL OF STAFF OF INSPECTORS AND INSTRUCTORS.

Inspectors.

James McGregor	Chief Inspector.
Robert Strachan	Senior Inspector, Fernie (Kootenay and Boundary Districts).
John McDonald	Inspector, Fernie.
H. H. Johnstone	Temporary Inspector, Rossland.
Henry Devlin	Inspector, Nanaimo.
Thomas R. Jackson	Inspector, Nanaimo.
J. G. Biggs	Inspector, Merritt.
Thomas J. Shenton	Inspector, Prince Rupert.

Instructors, Mine-rescue Stations.

J. T. Puckey	Instructor, Fernie.
John D. Stewart	Instructor, Nanaimo.
John Thompson	Instructor, Cumberland.
W. C. Stone	Instructor, Middlesboro.

By amendment to the "Coal-mines Regulation Act" during 1919 the Board of Examiners for coal-mine officials and miners was placed under the jurisdiction of the Inspection Branch. The personnel of the Board of Examiners for coal-mine officials is as follows:—

James McGregor, Chairman.
James Dickson, Secretary, Member of Board, and Acting Inspector of Mines.
Harry E. Miard, Member of Board and Acting Inspector of Mines.

Messrs. Dickson and Miard and the District Inspector for the district in which an examination is being held form the Board for granting certificates of competency to coal-miners. An Inspector of Mines is empowered to grant provisional certificates to miners for a period not exceeding sixty days between regular examinations.

There have been no changes in the inspection staff and no new appointments made during the year.

TONNAGE OF COAL PRODUCED.

The gross tonnage mined by the coal-mines of the Province for the year 1921 amounted to 2,569,639 tons, being a decrease from the previous year of 127,135 tons, mainly due to stagnation of general trade, there being no labour troubles, strikes, or lock-outs during the year.

The Coast District, which includes Nicola-Princeton, Vancouver Island, and Aveling, produced 1,809,884 tons, a decrease of 39,501 tons compared with the previous year.

The Vancouver Island collieries produced during the year 1,625,931 tons, showing a decrease compared with the previous year of 72,323 tons.

The Aveling mines in the Northern District produced 800 tons for the year, being a decrease compared with the previous year of 600 tons.

The Crowsnest Pass District produced during the year 759,775 tons, being a decrease of 87,634 tons compared with the previous year. The principal decrease was at the Corbin mines, which had a decrease of 83,683 tons out of a total decrease for the district of 87,634 tons.

ACCIDENTS IN COAL AND METALLIFEROUS MINES.

The compilation of tables showing number and character of accidents in coal and metalliferous mines in British Columbia is undertaken by the Workmen's Compensation Board under

the "Workmen's Compensation Act." The fatal accidents only will be dealt with in my annual report in connection with tonnage and persons employed, as shown by the following tables.

FATAL ACCIDENTS IN AND AROUND COAL-MINES.

The fatalities in and around coal-mines during the year totalled ten. There were 6,885 men employed in and around the coal-mines.

The ratio of accidents per 1,000 persons employed was 1.45, compared with 2.67 in 1920; in 1919 the ratio was 2,103, in 1918 the ratio was 5,159, and in 1917 it was 8.51. The ratio for the last ten years was 4.81.

The following table shows the collieries at which fatal accidents occurred during 1921, and their relation to accidents which occurred in 1920:—

Name of Company.	Name of Colliery.	1921.	1920.
Canadian Collieries (D.), Ltd	Comox	4	3
Canadian Collieries (D.), Ltd	Extension	1	2
Western Fuel Corporation of Canada	Nanaimo	..	4
Pacific Coast Coal Mines	South Wellington	..	2
Middlesboro Collieries Co.	Middlesboro	..	1
Crow's Nest Pass Coal Co.	Coal Creek	2	2
Crow's Nest Pass Coal Co.	Michel	..	1
Granby Collieries	Cassidy	3	2
Totals		10	17

The following table shows the various causes of fatal accidents in coal-mines and the percentage of the whole, with corresponding figures for the previous year:—

Cause.	1921.		1920.	
	No.	Per Cent.	No.	Per Cent.
Fall of rock	6	60	8	47.06
Mine-cars and haulage	4	40	5	29.42
Fall of coal	..	..	2	11.76
Material falling in shaft	..	..	1	5.88
Fell from scaffold	..	..	1	5.88
Totals	10	100	17	100.00

The number of tons of coal mined for each fatal accident during the year 1921 was 256,963 tons, compared with 158,633 tons in 1920.

FATAL ACCIDENTS IN METALLIFEROUS MINES.

There were three fatal accidents in the metalliferous mines of the Province during the year 1921, being a decrease of two compared with the year 1920.

There were 2,099 persons employed in and around the metalliferous mines, a decrease of 1,242 compared with the previous year. Fatal accidents were three.

The ratio of fatal accidents per 1,000 persons employed was 1.43, compared with 1.54 in 1920. The ratio for the last ten-year period was 2.89.

The mines at which fatalities occurred are:—

Mining Division.	Mine.	No. of Accidents.
Slocan	Rambler-Cariboo	1
Skeena	Surf Inlet	1
Vancouver	Britannia	1
Total		3

The following table gives the cause and percentage to the whole of the fatal accidents in metalliferous mines, with corresponding figures for 1920:—

Cause.	1921.		1920.	
	No.	Per Cent.	No.	Per Cent.
Falls of ground	2	66.67	2	40.00
By falling into chutes, raises, winzes	..	....	1	20.00
By mine-cars and haulage	1	33.33	..	....
Material falling in shaft	..	....	..	....
By cage in shaft	..	....	1	20.00
By explosion of powder	..	....	..	....
By explosion of gas	..	....	..	....
Miscellaneous (surface)	..	....	1	20.00
Totals	3	100.00	5	100.00

There were two fatal accidents from falling ground in metalliferous mines during the year 1921 and one from mine-cars and haulage.

There were no fatal accidents from explosions of powder, making four years in succession without a fatal accident from that cause.

The output from the metalliferous mines for the year 1921 was 1,562,645 tons, compared with 2,178,187 tons in 1920, showing a decrease of 615,642 tons.

The number of tons of ore mined for each fatal accident in 1921 was 520,881 tons, compared with 435,637 tons in 1920, an increase of 85,244 tons.

Explosives.

The following table shows the quantity of explosives used in the coal-mines of the Province during the year 1921, together with the number of shots fired, how shots were fired, tons of coal produced by pound of explosive used, and the average pounds of explosive per shot fired:—

District.	Quantity of Explosive used in Pounds.	Tonnage for District.	No. of Shots fired by Electricity.	No. of Shots fired by Fuse.	Total No. of Shots fired.	Tons of Coal per Pound of Explosive.	Average Pounds of Explosive per Shot fired.
Vancouver Island	483,964	1,811,618	650,290	...	650,290	2.79	0.74
East Kootenay	25,128	759,755	32,803	...	32,803	30.00	0.75
Nicola-Princeton	73,812	183,153	92,680	...	92,680	2.48	0.79
Northern District	.....	.....	.....	...	.....	... ..	....
Totals	582,904	.....	775,773	...	775,773	4.41	0.75

The production of coal per pound of explosive used is less than that of the previous year.

The East Kootenay District shows a decrease of 24.72 tons per pound of explosive used, the yield being 12.56, compared with 37.28 tons for 1920. This is entirely accounted for by the Corbin mines having abandoned the quarrying or steam-shovelling system, having now commenced mining under cover.

The Nicola-Princeton District shows a decrease of 0.63 ton per pound of explosive used, the yield being 3.11 tons, compared with 3.74 tons in 1920.

The Vancouver Island mines show a decrease of 0.46 ton per pound of explosive used, the yield being 2.79 tons, compared with 3.25 tons in 1920.

The estimated yield at Aveling is 4 tons per pound of explosive used.

During the year 1921 one additional explosive was added to the permitted list for British Columbia, known on the United States permitted list as Coalite "E" L.F. This powder is

UNIVERSITY OF ILLINOIS LIBRARY
JAN 8 1923

manufactured by the Giant Powder Company. The full list of explosives now permitted is as follows:—

Monobel A1	British List.
Monobel No. 1	"
Dynobel No. 4	"
Polar Permitite	"

SAFETY-LAMPS.

The following table shows the distribution of lamps by districts, method of locking, and the illuminant used:—

District.	Magnetic.	Screw or Automatic Clip.	Naphtha.	Electricity
Crowsnest Pass	100	1,292	100	1,292
Nicola-Princeton	59	495	59	495
Vancouver Island	487	2,937	487	2,937
Totals	646	4,724	646	4,724

The Edison electric cap-lamp is still finding great favour, both with the operator and workmen underground, and has proven beyond the experimental stage to be a very efficient and safe lamp.

MINE-AIR SAMPLING.

The same system in taking air samples has been followed as in the past year throughout the Province. Careful checking has been continued between the chemical analysis received from the laboratory at Ottawa and the results from the Burrell gas-detector in use in the different mines of the Province. The difference between the test made at the laboratory at Ottawa and the readings of the Burrell gas-detector with reference to the amount of CH_4 contained in the mine atmosphere does not vary more than one-tenth of 1 per cent.

The Inspector of each coal-mining district is supplied with the Burrell gas-detector, also each of the coal-mining companies have them in use for making its own tests.

During the year 1919 the Hon. William Sloan, Minister of Mines, had a chart prepared in booklet form and issued to the officials and workmen, showing the length of flame-cap on a Wolf safety-lamp for the different percentages up to 2½ per cent. This chart was compiled from actual tests covering nearly two years.

The following table shows the data obtained from the mine-air samples in coal-mines during the year 1921:—

RETURNS FROM MINE-AIR SAMPLES TAKEN IN THE VARIOUS COAL-MINES OF THE CROWSNEST DISTRICT DURING THE YEAR 1921.

Sample No.	Date	Mine.	Ventilating District.	Working or Idle.	Tonnage per Day.	Tonnage of Split per Day.	Chemical Analysis.				Velocity of Air in Feet per Minute.	Quantity of Air in Cubic Feet per Minute.	Barometer.	Hygrometer.			Cubic Feet of Methane per Minute.	Cubic Feet of Methane per Day.	Cubic Feet of Methane per Ton of Coal mined.

BUMPS IN COAL-MINES.

The disturbances in the different coal-mines of the Province known as "bumps" or "blow-outs" have not been so severe during the year 1921 as they were in 1920; especially in the Crowsnest Pass District, where they have quite a number, none of them doing any great damage, other than displacing a few sets of timbers and dislodging a small quantity of coal from the face or sides and liberating large quantities of methane. There have been no injuries from that cause during the year.

In the Granby No. 1 mine at Cassidy, on Vancouver island, similar disturbances have occurred frequently during the year, dislodging large quantities of coal from the face and sides of headings, giving off methane freely, but the flow of methane does not continue for any great length of time, the rush of methane being over generally in a few hours. There have been no injuries from that cause up to the present, every precaution being taken when an outbursts occurs, both in the Crowsnest Pass mines and the Island mine, to prevent accidents.

MINE FIRES.

There have been no serious outbreaks of fires in the mines during the year. Those which have been walled off were carefully guarded and kept under control.

EXPLOSIONS.

There have been no explosions during the year 1921.

MINE-AIR SAMPLES.

There have been a great many mine-air samples taken at the Crowsnest Pass coal-mines during the year and analysed at the Bureau of Mines at Ottawa. The results of many of these tests are published in this report. This important work done in this respect by the Bureau of Mines at Ottawa is much appreciated by the Department of Mines, especially as it is gratuitously performed.

CARBON-MONOXIDE DETECTORS.

During the year 1920 the carbon-monoxide detector was perfected by Mr. Burrell, of the United States, member of the Bureau of Mines. This will be an assistance in detecting a small percentage of the dangerous gas given off during mine fires or heavy exposions of powder underground.

As soon as the instrument was accepted by the Bureau of Mines of the United States, the Hon. William Sloan, Minister of Mines, ordered one for each rescue-station in the Province.

MINE-RESCUE WORK.

Instruction in mine-rescue work has been actively and effectively maintained at the different rescue-stations throughout the Province during the year.

There were quite a number of men who took the course and qualified for certificates of competency; also a number who had qualified in previous years kept up their training during the year. At the present time there are 499 men who have qualified and secured certificates issued by the Mines Department.

The training course necessary to qualify for a certificate of comptency consists of wearing the oxygen breathing apparatus for two hours a day for twelve days in an irrespirable atmosphere, performing considerable work while there, in addition to spending many hours familiarizing themselves with the many parts of the apparatus, testing of the apparatus for defects, and assembling it in the shortest time.

These volunteers deserve great credit for taking this course of training, as they do so without remuneration.

Cumberland Mine-rescue Squad.

Cumberland First-aid Squad.

LIST OF PERSONS WHO HAVE RECEIVED MINE-RESCUE CERTIFICATES DURING 1921.

FIRST-AID WORK.

The enthusiasm in this work is quite the reverse of that displayed in mine-rescue work; a growing interest is manifested in first-aid training in many branches of industry, and we have now, especially around the coal-mining centres, first-aid teams who have demonstrated they are equal to any teams on the continent, which means a great amount of good can be accomplished in and around the mining centres and other industrial plants.

MACHINE-MINED COAL.

During the year mining-machines produced 132,864 tons of coal, or 5.16 per cent. of the whole. This is a decrease compared with the amount of machine-mined coal in 1920, when the percentage of machine-mined coal was 5.51. Of the total machine-mined coal, the Canadian Western Fuel Company produced 42,720 tons, or 32.15 per cent.; the Canadian Collieries (D.), Limited, produced 77,184 tons of machine-mined coal, or 58.10 per cent.; the Crow's Nest Pass Coal Company produced 7,800 tons of machine-mined coal, or 5.90 per cent.

The Princeton Coal and Land Company did not produce any machine-mined coal during the year, while it produced 20,717 tons in 1920. In 1921 the output for the year, amounting to 13,966 tons, was principally taken from pillars where coal-cutting machines would be useless. The Nanoose Collieries produced 3,000 tons, or 2.30 per cent.; Chu Chua Collieries produced 2,160 tons, or 1.55 per cent.

The following table gives the district, number of machines, how driven, tons of coal produced, and type of machine:—

District.	Types of Machine in Use.		Tons of Coal produced.		Total Tons.
	Compressed Air.	Electricity.	Electricity.	Compressed Air.	
Vancouver Island	9	4	77,184	45,720	122,904
Nicola-Princeton	2	..	.....	2,160	2,160
Crowsnest Pass	3	..	.....	7,800	7,800
Totals	14	4	77,184	55,680	132,864

EXAMINATIONS FOR COAL-MINE OFFICIALS.

The "'Coal-mines Regulation Act," as now consolidated and amended, provides that all officers of a coal-mining company having any direct charge of work underground shall hold Government Certificates of Competency, which are to be obtained only after passing an examination before a duly qualified Board appointed for the purpose of holding such examinations, and known as the Board of Examiners.

The certificates granted on the recommendation of such Board and the requirements shall be as follows:—

"(*a.*) If a candidate for a manager, that he is a British subject and has had at least five years' experience in and about the practical working of a coal-mine, and is at least twenty-five years of age; or, if he has taken a degree in scientific and mining training, including a course in coal-mining at a university or mining school approved by the Minister of Mines, that he has had at least four years' experience in and about the practical working of a coal-mine:

"(*b.*) If a candidate for overman, that he has had at least five years' experience in and about the practical working of a coal-mine, and is at least twenty-three years of age:

"(*c.*) If a candidate for shiftboss, fireboss, or shotlighter, that he has had at least three years' experience in and about the practical working of a coal-mine, is the holder of a certificate of competency as a coal-miner, and is at least twenty years of age:

"(*d.*) A candidate for a certificate of competency as manager, overman, shiftboss, fireboss, or shotlighter shall produce a certificate from a duly qualified medical practitioner or St. John or other recognized ambulance society, showing that he has taken a course in ambulance-work fitting him, the said candidate, to give first aid to men injured in coal-mine operations:

"(*e.*) If a candidate for a certificate of competency as a mine surveyor, that he has had two years' practical experience in the surveying of mines, or is the holder of a diploma in scientific and mining training after a course of study of at least two years at an educational institute approved by the Minister of Mines, or has taken a degree in scientific mining subjects at a university so approved.

"'For the purposes of this section the experience demanded by such section shall be of such character as the Board shall consider of practical value in qualifying the candidate for the position to which such class of certificate applies.

"'Experience had in a mine outside of the Province may be accepted should the Board consider such of equal value."

Any certificate is considered as including that of any lower class.

EXAMINATION FOR MINERS.

In addition to the examinations and certificates already specified as coming under the Board of Examiners, the Act further provides that every coal-miner shall be the holder of a certificate of competency as such. By "miner" is meant "a person employed underground in any coal-mine to cut, shear, break, or loosen coal from the solid, whether by hand or machinery."

Examinations of applicants for certificates of competency as coal-miners shall be conducted and certificates of competency granted by a Board of Examiners, which shall consist of the Inspector of Mines for the district in which the examination is held, and two other members to be appointed by the Minister, one of whom shall be appointed to represent the mine-owners and one to represent the coal-miners. The two appointed members of the Board shall have jurisdiction in all districts throughout the Province. The Minister shall appoint one of the appointed members to be Chairman and the other to be Secretary of the Board, and they shall hold office during the pleasure of the Minister.

Where any member of the Board of Examiners is unable to act at any examination by reason of illness, absence, or other cause, the Minister may appoint a person to act in the stead of that member for that occasion, or until the termination of the disability, and any person so appointed may complete any unfinished business of the Board in which he has taken part, even if the member in whose stead he has acted has become able to act.

The proceedings of the Board of Examiners shall be in accordance with the rules in the Third Schedule to the Act.

Examinations of applicants for certificates of competency as coal-miners shall be held on at least one day in every period of sixty days at each colliery designated by the Minister as a place for the holding of examinations under this section.

The work of the Board of Examiners in examining candidates for coal-miners' certificates has been carried on in all mining districts at intervals of less than sixty days, as required by the amendment of the Act.

No certificates have been granted in any case where the candidate failed to satisfy the Board as to his general fitness, experience in a coal-mine, and a working knowledge of the English language.

During 1921 seventy-six examinations were held for candidates for certificates of competency as coal-miners in the various coal-mining districts of the Province and 456 certificates issued. In addition to above, a number of duplicate certificates were issued to coal-miners who had lost their original certificates of competency.

BOARD OF EXAMINERS FOR COAL-MINE OFFICIALS.

FIRST-, SECOND-, AND THIRD-CLASS CERTIFICATES.

Report of James Dickson, Secretary of Board.

I have the honour to submit herewith the annual report of the transactions of the above Board for the year ending December 31st, 1921.

The Board of Examiners, which was formed on July 1st, 1919, at present consists of James McGregor, Chief Inspector of Mines, as Chairman; Harry Ernest Miard, member; and James Dickson, member and Secretary of the Board.

The meetings of the Board are held in the office of the Board, Mines Department, Victoria. The first work was the drafting of the following rules for the conduct of examinations for certificates of competency as mine officials:—

RULES MADE BY THE PROVINCIAL BOARD OF EXAMINERS, JULY 16TH, 1919, AND APPROVED BY THE MINISTER OF MINES, JULY 16TH, 1919, UNDER SECTION 38 OF THE "COAL-MINES REGULATION ACT, 1911," AND AMENDMENT ACT, 1919, FOR THE CONDUCT OF EXAMINATIONS.

1. No application for examination will be considered from any candidate unless it is received by the Department of Mines at least fifteen days previous to the date on which the examination is to be held.

2. The examination sittings shall begin at 9 a.m. and continue until 12.30 p.m.; they shall resume at 2 p.m., and continue until 5.30 each day until the conclusion of the examination.

3. The examinations shall be conducted by the Presiding Examiners appointed by the Board.

4. The Presiding Examiners shall be present in the examination-room at least fifteen minutes prior to the time at which the examination commences.

5. Before each examination the question papers shall be prepared by the Examiners appointed by the Minister, and the necessary copies forwarded to the Presiding Examiners, each set of papers being in a separate sealed package.

6. At the time of the commencement of each session of the examination, when the candidates are in their respective places, the seal of the package shall be broken in the examination-room in the presence of the candidates and the papers distributed punctually in accordance with the time-table on the package.

7. Candidates must present themselves punctually at the hours appointed for the commencement of the examination, and no candidate will be allowed to enter the examination-room later than forty-five minutes after the time set for the commencement of the examination, nor will any candidate be allowed to leave the room during a sitting unless in case of extreme necessity.

8. When the time allotted to each paper has expired, the papers shall be collected by the Presiding Examiners and immediately placed in a package and sealed. At the completion of the examination these papers shall be forwarded to the office of the Board of Examiners for Coal-mine Officials, Victoria, B.C.

9. The examination shall be conducted strictly in accordance with these rules, and the papers of any candidate who does not comply with these rules may be cancelled at the discretion of the Board.

10. The Presiding Examiners shall see that the room is clear of all possible aid to the candidates, and that no persons other than the Honourable the Minister of Mines, the Deputy Minister of Mines, the Provincial Mineralogist, members of the Board, Inspectors of Mines, and Examiners be allowed in the examination-room during sessions.

11. All stationery required for the purpose of the examination shall be supplied by the Board. All surplus stationery shall be collected by the Presiding Examiners at the completion of the examination. Each candidate shall be supplied with pens, ink, pencils, and blotting-paper.

12. The papers shall be collected at the times indicated by the time-table. If from any cause a paper is not given out precisely at schedule time, the candidates must be informed of the fact and the exact time at which their work will be collected, and care must be taken that the exact time is allowed from the moment from which the paper was given out. The time consumed in collecting and giving out papers must not be included in the "full time" allowed for any paper. A candidate who attends late shall not be allowed any extension of time on that account.

13. Before proceeding to his seat in the examination-room a candidate shall lay aside his hat and overcoat, and any book, papers, or appliances the use of which is not expressly allowed to him. The candidate shall be allowed to bring with him a drawing-scale, slide-rule, protractor, a pair of compasses, and logarithmic and trigonometrical tables. Apart from such special articles, a candidate shall be at liberty to take to his place in the examination-room such ordinary appliances as pens, ink, penknife, chalks, and india-rubber; but the Presiding Examiners may, at their discretion, prohibit the use of any such articles.

14. If a candidate arrives late a note of the circumstances shall be made, and it shall always be stated whether any other candidate has already left the room.

15. The Presiding Examiners shall collect at the commencement of the examination the authorization obtained from the Department of Mines for appearing at the examination-room, and no candidate shall be allowed to enter the examination-room unless he presents such authorization.

16. Silence shall be observed in the examination-room while the examination is in progress.

17. The Presiding Examiners shall take every precaution to see that no candidate receives any improper assistance, either from books or papers or from any person. They shall check all disorderly or improper conduct in or about the room, enforce all rules for the conduct of the examination, and report to the Board any irregularity which may occur or any shortcoming in the arrangements for the examination.

18. Should it appear to the Presiding Examiners that a candidate has obtained improper assistance the papers of such candidate shall be cancelled. Any candidate giving assistance to another candidate shall be held to be equally guilty and shall be dealt with accordingly.

19. No candidate shall be allowed to leave the examination-room until the expiration of one hour after the time fixed for the commencement of the paper on which he is engaged.

A candidate obliged to leave the room through illness or other sufficient cause, and who wishes to return and continue work on the paper then in progress, shall leave the room in charge of a Presiding Examiner; a note as to the circumstances shall be made and the part of the paper at which the candidate was at work shall be endorsed by the Presiding Examiner, "The candidate left at this point."

Candidates shall not, without the express permission of the Presiding Examiners, remove from the examination-room any paper or other material supplied to them.

20. A candidate who asks a question as to any ambiguity in the papers shall be told to enter on his work any representation he may wish to make, but no further answer shall be given. The Presiding Examiners shall, themselves, forward a report to the Board stating the candidate's name and the general nature of the question.

A candidate making a complaint of any other nature shall be directed to make his statement in writing, which shall be sent to the Board.

21. Candidates shall be allowed, unless there is any special directions to the contrary, to keep their work in any subject until the expiration of the time allotted to that subject.

Every book, plan, form, or separate sheet of paper used by the candidate shall have inserted on it the name of the subject. The number of each question shall be inserted in the margin which shall be left along the left side of each sheet. In no case shall the name of the candidate be placed on any book, plan, form, or separate sheet of paper upon which the candidate has written or worked the answer to any question; but for the purpose of identification of papers the following system shall be used: At the commencement of the examination each candidate shall choose a number; he shall place this number on a slip furnished for this purpose, together with his name, and place the same in an envelope supplied for the purpose. These envelopes shall remain sealed until the paper has been examined. The candidate shall number all his examination papers with the number he has chosen and placed on the slip with his name.

22. Not more than one answer shall be written on the same sheet of paper. All answers shall be written in ink (except necessary diagrams, which may be in pencil) and on one side only of the paper, and each candidate shall enclose his question paper with his answers in the envelope supplied for the purpose.

23. After the Examiners have received the papers they will correct them and mark on them the marks obtained by each candidate for each paper.

24. After the examination the candidate will be furnished with a list of the marks obtained by him in the different subjects, but not the marks for the individual questions.

25. The apparent or presumed results of the examination shall not be communicated to any person until the same have been officially announced.

26. All correspondence intended for the Board must be addressed to the "Office of the Board of Examiners for Coal-mine Officials, Victoria, B.C."

27. The Presiding Examiners must see that the condidate obtains the right paper of questions.

28. All the work by which the results are obtained shall be clearly shown in immediate connection with the answer, so as to enable the Examiners to satisfy themselves that the candidate has understood the question and to see by what process the results were obtained. Anything which the candidate does not wish the Examiners to notice should be crossed out with pen or pencil, but not erased.

29. In the case of any applicant producing a certificate from a medical practitioner instead of from a recognized ambulance society, as provided for in section 41, subsection (*c*), such certificate shall be in the following form:—

"I hereby certify that I have examined , of , in ambulance work, and find him qualified to render first aid to persons injured in or about a mine.

"(Signed.).....
"*Medical Practitioner.*"

30. The nature of the practical experience shall be experience gained in one or other of the following capacities in a coal-mine, or in a capacity which may be considered by the Board to be equivalent to:—

(*a.*) An underground official of a coal-mine—
(1.) In actual practical work at the working-face and other parts of the underground workings of a coal-mine:
(2.) In direct supervision of such work; or
(3.) In both (1) and (2); or

(*b.*) As an underground workman of a coal-mine who has had direct practical experience in the work of getting minerals, and of stonework, timbering, and repairing:

(*c.*) As mine surveyor. In the case of a person employed as mine surveyor, the practical experience will be considered to be the time the applicant has been employed underground in a coal-mine.

31. Candidates for certificates must possess such knowledge as will enable them to answer promptly questions on the following subjects:—

For First-class Certificates—
(1.) Mining Act and Rules:
(2.) Mine Gases:
(3.) Ventilation:
(4.) General Work:
(5.) Mining Machinery:
(6.) Surveying and Levelling.

For Second-class Certificates—
(1.) Mining Act and Rules:
(2.) Mine Gases:
(3.) Mine Ventilation:
(4.) General Work, including questions on underground machinery and surveying.

For Third-class Certificates—
(1.) Mining Act and Rules and Mine Gases:
(2.) Mine Ventilation and General Work.

For Mine Surveyors' Certificates—
Surveying, levelling, and drawing; determination of magnetic declination; loose and fast needle surveying underground and on the surface; calculation of areas and volume; contour lines and levelling; connecting of surface and underground surveys; triangulation; plotting by protractor and latitudes and departures; mine plans and sections; the use, care, and testing of the instruments.

32. A candidate for First-class Certificate of Competency must obtain 70 per cent. of the maximum marks obtainable for the first three subjects, Mining Act and Rules, Mine Gases and Ventilation; and 60 per cent. of the marks obtainable on the fourth, fifth, and sixth subjects—namely, General Work, Mining Machinery, Surveying and Levelling; and 70 per cent. of the marks obtainable for the whole examination.

33. A candidate for a Second-class Certificate of Competency must obtain 70 per cent. of the marks obtainable for the first three papers, Mining Act and Rules, Mine Gases, and Mine Ventilation; and 60 per cent. for the fourth subject, General Work; and 70 per cent. of the marks obtainable for the whole examination.

34. A candidate for a Third-class Certificate of Competency must obtain not less than 65 per cent. of the marks obtainable on the first subject, Mining Act and Rules and Mine Gases; not less than 60 per cent. of the marks obtainable on the second paper, Ventilation and General Work; and not less than 65 per cent. of the marks obtainable for the whole examination.

35. A candidate for a Mine Surveyor's Certificate of Competency must obtain 70 per cent. of the marks obtainable for the whole examination.

In view of the following regulation made pursuant to the provisions of the "Coal-mines Regulation Act" by the Lieutenant-Governor in Council, examinations for mine surveyors' certificates of competency were also held:—

REGULATION.

1. After the 1st day of October, 1919, all plans required to be kept in accordance with the provisions of the "Coal-mines Regulation Act" shall be made of durable material, and the surveying of mines and the preparation of mine-plans shall be done by a person or persons holding a certificate granted under the provisions of the "Coal-mines Regulation Act" and Amendment Acts.

2. In no case shall a certificate be granted to any applicant until he has satisfied the Board of Examiners that:—

(1.) He has had two years' practical experience in the surveying of mines, or is the holder of a diploma in scientific and mining training after a course of study of at least two years at an educational institute approved by the Minister of Mines, or has taken a degree in scientific mining subjects at a university so approved:

(2.) He is competent:—

(*a.*) To make an accurate survey of the workings of a coal-mine and to connect such survey with a surface survey:

(*b.*) To make accurate survey and levellings:

(*c.*) To plot accurately surveys and levellings:

(3.) He has given satisfactory evidence of his sobriety and general good conduct.

3. Each plan required to be kept in accordance with the provisions of the "Coal-mines Regulation Act" shall have inserted on it the date on which the last survey was made and the signature of the person making such survey.

4. A certificate authorizing any person to act as mine surveyor may be granted to such person without written examination if the Board of Examiners reports that he has the necessary experience, and provided application is made for such certificate before the 1st day of December, 1919.

5. Every person who violates any rule or regulation under the "Coal-mines Regulation Act" or Amendment Acts shall be guilty of an offence against the "Coal-mines Regulation Act," and liable to the penalties and obligations imposed by the said Act.

Two examinations for candidates for certificates of competency were held during 1921; the first being held on May 18th, 19th, and 20th, and the second on November 22nd, 23rd, and 24th.

The total number of candidates at these examinations was as follows: For First-class Certificates, 8 (2 passed, 6 failed); for Second-class Certificates, 8 (4 passed, 4 failed); for Third-class Certificates, 23 (15 passed, 8 failed); for Mine Surveyor Certificates, 6 (2 passed, 4 failed).

The work of the candidates, especially for the higher certificates, leaves much to be desired.

It is the intention of the Board to maintain a high standard, so intending candidates, to gain a certificate of competency of any class, must give themselves thorough preparation.

The following is a list of the candidates who successfully passed the examination in the various classes:—

First-class Candidates.—George Murray and Thomas Wright Scott.

Second-class Candidates.—Robert Clark, Thomas Wright Scott, Fred Menzies, and Hugh G. MacKinnon.

Third-class Candidates.—C. S. Congalton, William C. Stone, Peter Caldwell, David Coupland, Robert Alstead, Richard Dunnigan, George Davey, William R. Nee, William Chapman, George F. Nash, Thomas J. Shea, William Adamson, Thomas Dobie, Robert McArthur, and Cornelius Morgan.

Mine Surveyor Candidates.—Luke Lindoe and Lucas Verkirk.

REGISTERED LIST OF HOLDERS OF CERTIFICATES OF COMPETENCY AS COAL-MINE OFFICIALS.

INSPECTION OF METALLIFEROUS MINES.

KOOTENAY AND BOUNDARY DISTRICTS.

REPORT BY ROBERT STRACHAN, SENIOR INSPECTOR.

I have the honour to submit my annual report as Inspector of Metalliferous Mines for the Kootenay and Boundary Districts for the year 1921.

For the purpose of inspection the district is divided into two, the East Kootenay portion being directly in charge of John MacDonald, Inspector of Mines, Fernie, while the West Kootenay and Boundary is in charge of H. H. Johnstone, Temporary Inspector of Mines, Rossland.

During the year mining operations have been very quiet, especially in the West Kootenay and Boundary District, many of the mines restricting their operations and some closed down temporarily.

The *Emma* mine at Coltern was shut down in June, the ore-body having become exhausted, and the plant was dismantled.

In the Nelson District the *Eureka*, *Mountain Chief*, and the *Yankee Girl*, all of which were working during 1920, remained idle during the year.

The *California* closed down early in the year, while the *Molly Gibson*, which had been closed down, was reopened in November under lease.

The *Granite-Poorman*, after being closed down for a long time, was also reopened in June and worked steadily until the end of the year.

In the Ymir District the *Nugget* mine worked during the entire year, while the *Queen* was operated for a brief period.

In the Trail District the *Le Roi* and *Centre Star* mines operated during the whole year, while the *Velvet-Portland* was in operation until November.

A force of men was employed around the *Le Roi No. 2*, engaged in reorganizing the mill, and some ore from the dump was treated.

In the Slocan District conditions were very quiet, the *Slocan Star* closing down in March, pending a reorganization of the *Ivanhoe* mill which they had acquired, and it was November before mining was resumed.

The *Rambler-Cariboo* worked intermittently during the year with a small force, while the *McAllister*, *Standard*, *Noble Five*, *Van Roi*, and the *Queen Bess* all worked during some portion of the year.

The *Bosun* operated during the entire year with an average force of twenty-one men, and no work was carried out at either the *Sovereign*, *Wonderful*, *Meteor*, *Ivanhoe*, *Hewitt*, or the *Ottawa*.

In the Ainsworth District the *Blue Bell*, *Silver Bell*, *Silver Bear*, *Carey*, *No. 1 Ainsworth*, *Highland*, and *Whitewater* operated during some portion of the year, while the *Beatrice* and *Index* did not do any mining.

The *Utica* at Kaslo was reopened in October with a force of sixteen men.

In the Boundary District the *Bell* and *Sally* mines at *Beaverdell* worked steadily during the year, and the *Providence* mine at Greenwood closed down in August, with a watchman in charge to attend to the pumps.

The *Rock Candy* mine at Grand Forks did not operate during the year, and, as I have already mentioned, the *Emma* mine was abandoned.

In the East Kootenay District the *Sullivan* mine worked very steadily during the year, both in the upper workings and in the lower. The development-work here is still being energetically pushed, and the indications are that the present output of 950 tons a day will be largely increased in the near future. At the end of the year the work of clearing the ground for a concentrator was commenced, and plans are ready for enlarging the first 400 feet of the tunnel to allow of the using larger mine-cars. In the mine some large stopes have been opened up, and owing to the flatness of the ore-body large scrapers are in use for mucking. These large scrapers are operated by compressed hoists, and electric search-lights of 500-candle power are fitted on stands with swivel joints for illuminating these large stopes.

A few men were employed during the year turning over the old dump at the *North Star* mine, and the *St. Eugene* was closed down early in the year.

The following table shows the number of men employed in the mines inspected during the year as compared with the previous year, according to district:—

	1920.	1921.
Nelson	141	43
Trail	325	224
Slocan	349	101
Ainsworth	119	54
Boundary	145	62
Revelstoke	20	...
East Kootenay	250	220
Totals	1,349	706

This shows a reduction of about 47.6 per cent. in the number of workmen engaged in and around the mines.

In addition to those inspected, there are a number where a few workmen have obtained a lease, and, as I have mentioned in previous reports, it is very difficult to keep trace of these owing in a great measure to no reports being sent to this office of either the temporary abandonment or reopening.

Owing to the above curtailing of operations only twenty-four mines were inspected, as compared with forty-two during the previous year. Of this number, only nine mines had a working staff of over twelve men and fifteen had less than twelve men employed.

One hundred and twenty-four visits of inspection were made during the year; in the case of the larger mines this was made almost monthly, and in the case of the others as occasion warranted.

The general conditions with respect to the enforcement of the "Metalliferous Mines Inspection Act" were fairly good in the case of the larger mines; in some of the smaller properties complaints have had to be made with respect to ladder-ways and explosives. In some of the latter class of mines the method of handling and storing the explosives taken in for the use of the working shift is far from satisfactory or safe. Proper receptacles or storage-places should be provided for the storage of explosives when taken underground and not immediately used, while the explosive should only be issued by or under the supervision of some competent person appointed for the purpose. In some of the smaller mines more attention should be paid to the installing of the ladder-ways, more especially in inclined shafts, that substantial platforms be provided at intervals of not more than 20 feet. These ladders are generally put in temporarily or as a matter of prospecting, and when the shaft later develops great reluctance is shown to have these ladders made to comply with section 31, Rule 21. Under the conditions, I feel it would be better to have them built in as provided by the Act in the first case.

Apart from the foregoing, the general conditions in and around the mines are very good, and especially in the larger mines the managers are to be complimented on their efforts to enforce the provisions of the Act.

The conditions around the cook and bunk houses are very good, and in this respect I should mention that the cook and bunk house at the *Sullivan* mine was destroyed by fire during the year, causing a great deal of inconvenience. The new arrangements provide for twelve bunk-houses, each to contain a limited number of men, two to each room, and a large cook-house. Three of these bunk-houses are already in use, with a temporary cook-house, and all the buildings are to be heated by a common steam plant.

ACCIDENTS.

Seven accidents have been reported during the year, six from the East Kootenay District and one from the West Kootenay. The seven accidents resulted in the death of one man and serious injury to six. Haulage caused four accidents, machinery one, cave of roof one (fatal), and miscellaneous one. According to occupation, three miners were injured (including the fatal accident), one mucker, one axeman, one machinist, and one motorman. Six of the accidents occurred inside the mine and one outside.

In the case of the fatal accident, which occurred at the *Rambler-Cariboo* mine, the workman had been sent into an old stope which, after the ore had been extracted, had been filled up with mill-feed ore. No inspection of the stope had been made from the previous day, and when the foreman visited the stope about noon he found the workman dead under a cave of roof-rock.

When I visited the place a few days after the accident I found about 150 square feet of the hanging-wall or roof without any support and full of breaks or fractures, due no doubt to settlement after the ore had been extracted. I feel that more care should be taken to see that the working-place is secure, and while a certain amount of this care may fall on the miner, twenty-four hours is too long a time to elapse between inspections; that is, if these inspections are to count for anything.

In stopes where the mineral has been extracted and are being used for storage or travelling, more and better inspections should be made, and, if possible, some method of systematic timbering either could or should be adopted. In this case the Coroner decided that no inquest was necessary.

The other accidents, all of which occurred in the *Sullivan* mine, four were due to haulage, and I am glad to report that greater care is being taken in this direction.

Twelve samples of mine-air were taken during the year and sent to the Department of Mines at Ottawa to be analysed, and the results showed the conditions to be fairly good. In those taken at the *Sullivan* mine, Kimberley, a very small percentage, not more than 0.04, of carbon monoxide was noted, and is probably due to the practice of bulldozing, breaking-up of large rocks by placing untamped charges of explosives on them.

It is very disappointing to note the lack of interest in the work of first aid to the injured and mine-rescue. In the case of the latter, mine-rescue apparatus have been installed at both the *Sullivan* and *Rossland* mines, but the condition in which they are kept, and the lack of properly trained men to use them, make them more dangerous than useful.

No classes in first aid to the injured have been held during the year at any of the mines, and I feel it would be profitable both to the workmen and the employers to make a greater effort to maintain interest in this humanitarian work.

We wish to thank the officials and workmen for their assistance in discharging our duties during the year.

There have been no prosecutions during the year, and following is a list of the accidents reported during the year:—

LIST OF ACCIDENTS IN METALLIFEROUS MINES, KOOTENAY-BOUNDARY DISTRICT, DURING 1921.

No.	Mines.	Date.	Name.	Occupation.	Details.
1	Sullivan (C.M. & S. Co. of C.)	Dec. 12	A. Bortolozzi	Miner	Passing loaded car, when it dumped over on top of him, breaking his arm (occurred in 1920, not reported till March, 1921).
2	Sullivan (C.M. & S. Co. of C.)	Jan. 4	Sid Mayne	Axeman	Power-driven saw struck knot, deflecting it so that it struck the hand, severing thumb.
3	Sullivan (C.M. & S. Co. of C.)	April 27	Von Battista	Miner	Passenger-locomotive bumped into stalled train, causing party to fall off, his foot getting caught under train, probably fracturing it.
4	Sullivan (C M. & S. Co. of C.)	June 13	Gus Nelson	Machinist	Fractured leg, caused by empty car of a trip jumping off track.
5	Sullivan (C.M. & S. Co. of C.)	" 25	Ar. Shuauh	Motorman	Severely injured, due to locomotive colliding with another locomotive.
6	Rambler-Cariboo (R.C. Mining Co.)	July 24	Geo. Heatherton	Miner	Cave of rock in stope; fatal.
7	Sullivan (C. M. & S. Co. of C.)	Oct. 18	Philip McNeill	Mucker	Piece of rock rolled down from top of muck-pile, fracturing thigh-bone.

NICOLA-PRINCETON INSPECTION DISTRICT.

REPORT BY JOHN G. BIGGS, INSPECTOR.

I have the honour to submit my annual report as Inspector of Metalliferous Mines for the Nicola-Princeton District for the year ending 1921.

Mining has not been at all active, with most of the larger mining companies suspending operations during the latter part of the year 1920 owing to the cost of production and the unsatisfactory conditions of the markets, and while it must be admitted that there has been a large decrease in the production costs during the year, the markets for the products have remained very sluggish, with the eventual result that the different mining companies have not felt justified in operating.

There was only one mine in this district operated during the whole of the year, which was the *Horn Silver* mine in the Osoyoos District, which employed an average of sixteen men.

The Hedley Gold Mining Company commenced operations at the *Nickel Plate* mine, situated at Hedley, in May, work being only of an exploratory nature; all ore produced was stored in bins, the mill not operating during the year.

The Kamloops Copper Company, while not operating the *Iron Mask* mine during the year, has employed a stall of men in the installation and equipment of machinery for reducing the cost of production, while the Canada Copper Company has not operated the *Copper Mountain* during the whole of the year.

Conditions prevailing at the mines inspected during the year I have found to be good and the provisions of the "Metalliferous Mines Inspection Act" well adhered to, and when advised of any omissions these are immediately attended to. I have always found the managers of the different mines showing a desire to conform with requirements of the Act. It is also very gratifying to report that there have been no accidents at the metalliferous mines in this district during the year, which is a good record and goes to show that care is being taken by both workmen and officials.

The following is a brief description of the various mines that have been operated and plants improved during the year:—

Horn Silver. P. W. Powell, superintendent; operated by Powell Bros. and Mrs. Powell, Similkameen and Victoria. This mine is situated about 15 miles below Keremeos and 6 miles below the Similkameen Station, and is reached by a fairly good wagon-road used for hauling the ore from the mine to the depot on the Great Northern Railway. The mine is situated on the east side of the mountain at an elevation of 2,400 feet and about 1,100 feet above the mine camp.

There has been very little development-work done at this mine during the year, the ore being extracted from both the upper and lower levels. The roof, being of a rather fragile nature, necessitates a careful system of timbering; in the upper level the method of work is at present a modified system of long-wall, all waste material being thrown into the gob and used for packing the roof at the face, being well supported by means of posts and stulls. The method of work in the lower level is stoping.

There has been no change made with this plant during the year, the ore being brought out of the mine by means of small cars and dumped over a bar-screen and sorted, where it is loaded into buckets attached to an aerial tramway 3,000 feet in length and conveyed to the foot of the mountain, where it is automatically dumped into an ore-bin and hauled by teams to the depot at Similkameen.

During my inspections I have always found this mine to be in good condition, well timbered, and the provisions of the "Metalliferous Mines Inspection Act" well adhered to. Fifty-per-cent. Polar Forsite is used for blasting, which is stored in a magazine and only sufficient taken out for a day's supply. The only power used is a 50-horse-power gas-engine for driving a compressor having a capacity of 102 feet a minute, which is used for driving power-drills.

Nickel Plate. G. P. Jones, general manager; Wallace Knowles, superintendent. This mine is situated in the Osoyoos Mining Division, on the Nickel Plate mountain at an altitude of 5,500 feet and 3,800 feet above the town of Hedley, where the mill for treatment of ore is situated. The mineral is found in lenticular bodies developed by tunnels driven through the country-rock until the ore-bodies are reached. All the ore is taken

out by a 16 by 8 well-timbered slope (of 20°) provided with double tracks and a travelling-way, from which levels are started approximately every 100 feet.

Skips having a capacity of 2 tons of ore are operated by separate compressed-air engines situated at the top of the incline, are loaded at the various chutes and dumped into a common ore-bin, where the ore is loaded into a train of cars hauled by an electric trolly-motor to the top of the surface incline, where it is dumped into a large bin, from which it is drawn into skips which operate on this gravity-plane to the mill.

The gravity-tram is operated in two stages. The skips have a capacity of 5 tons. In the first stage the skips are lowered a distance of 4,000 feet on the incline to the central station, where they are transferred to the lower portion of the tramway and continue a distance of 6,000 feet, descending a total vertical distance during the trip of 3,800 feet.

This mine ceased operations in November, 1920. When work recommenced in May, 1921, it was of an exploratory nature, with about thirty men employed.

During the year the Dixon slope has been extended from the 1,080- to the 1,260-foot level, a distance of 180 feet, while the 102 on the 1,000-foot level has been extended 500 feet with diamond-drilling to prove the ore-bodies, with a little stoping. About 2,000 tons of ore was sent over the incline to the ore-bins at the mill during the year, which was utilized for a balance for the tramway in order to maintain haulage facilities for the transportation of equipment and supplies for the employees residing at the mine. Operations were again suspended during the month of November.

There has been no change made at this plant during the year, which consists of a 2,000-horse-power hydro-electric plant situated near the Similkameen river, 1 mile below the town of Hedley, which is used for driving a 400-horse-power, belt-driven, 17 by 28 by 36, 2-stage compressor, and one 2-stage compressor, 15 by 25 by 24, direct-driven by a 440-horse-power synchronous motor. An auxiliary steam plant consists of a single Goldie-Corliss engine, 21 by 30, directly connected to a 375-kw. generator, with a Doble water-wheel and Lombard governor attached; one 8 by 14 vacuum O pump, motor-driven, for Oliver filter at the mill; and three return-tubular boilers having an aggregate horse-power of 315, all situated at the mill.

Sixty-per-cent. Polar Forsite is used for blasting, all shots being fired by fuse and caps. During my inspections I have found the provisions of the "Metalliferous Mines Inspection Act" well adhered to and every precaution being taken to protect the workmen.

Iron Mask.

A. Wallinder, superintendent. This property consists of the *Iron Mask* and *Erin* and is situated about 7 miles south-east of the city of Kamloops at an elevation of 3,600 feet. Two shafts, the *Iron Mask* and the *Erin*, have been connected for ventilation purposes. The mineral consists of copper in the form of sulphides and carbonates. The power being used is electric and is transmitted over high-voltage wires from the city of Kamloops at a voltage of 11,000, and is cut down to 440 volts for use in and around the mine.

The mine has not been operated during the year owing to the unsatisfactory state of the copper market. Several improvements have been done by way of repairs to the *Iron Mask* shaft and the installation of new machinery and equipment for the better treatment and handling of the ore.

Repairs have been continued at the shaft during the year which has been retimbered with 14-inch square sets from the 150- to the 750-foot level. Ore-pockets have been enlarged to 250 tons capacity, with a waste-pocket of 75 tons capacity, and the 750 station considerably enlarged.

The mill crushing plant was increased by the addition of 42-inch rolls in conjunction with the Gates gyratory crusher, enabling to crush from 2-inch to ¾-inch mesh, which should appreciably increase the capacity of the ball-mill; also the mill storage-bins were increased to 500 tons capacity. The tailings settling capacity was doubled by the installation of a new 12- by 50-foot concrete Dorr thickener.

The filtering of the flotation concentrates, as well as the hauling of the same to the Canadian Pacific Railway siding, has been eliminated by the installation of a pipe-line and a series of settling-tanks at the loading-track. The pumping plant at the Thompson river, 3½ miles distant and 1,750 feet lower elevation, was completed, which will assure an ample supply of good water for both milling and domestic purposes.

During my inspections of this mine I have found the provisions of the "Metalliferous Mines Inspection Act" well adhered to, with good accommodations provided for the workmen.

COAST INSPECTION DISTRICT.

REPORT BY JAMES DICKSON, INSPECTOR.

I have the honour to submit my annual report as Inspector of Mines for the above district during the year ending December 31st, 1921.

Britannia. E. J. Donohue, general manager; G. Nettleton, secretary-treasurer; C. P. Browning, superintendent. These mines, the property of the Britannia Mining and Smelting Company, are situated on Howe sound, about 28 miles from Vancouver, and are reached by a daily steamship service. Owing to the disturbed condition of the copper market at the end of 1920 this company was not operating on its usual large scale and none of the ore produced was milled. The ore was put into bunkers, where it is readily available when required, 47,380 tons being produced during the year and practically all in the first three months. The mill, which had been idle for several months, caught fire on March 19th, 1921, and was totally destroyed.

In the main operation a drift 186 feet long was driven on a 30° slope from the 1,800-foot to the 1,700-foot level, at which point a crusher-chamber was enlarged for the installation of the 24 by 36 jaw-crusher which previously operated on the 1,800-foot level, complementing the 7½-kw. gyratory crusher. With the above installation it is arranged to give a 2-stage preliminary crushing to the ore, reducing same to a 2½-inch ring before it leaves the mine.

Practically all the development-work has been done in the *Victoria* part of the property. The development footages were as follows: Drifts, 1,909 feet; crosscuts, 1,027 feet; raises, 3,194 feet; and winzes, 118 feet, giving a total footage of 6,248. There was no diamond-drilling during this period.

The hoisting equipment at the *Victoria* has been installed on the 1,900-foot level, and the ore below this will be hoisted to the 1,900-foot level and transported from the *Victoria* to the portal of the 1,600-foot level of the *Empress* by means of an aerial tramway. From this point the ore will be carried through the main operation to the 2,200-foot level, receiving, en route, the preliminary crushing referred to above.

Near the entrance to the *Victoria* mine a sawmill has been erected with a capacity of 30,000 feet a day, from which all the timber required is handled directly to the workings. A three-story 30- by 100-foot bunk-house and a 25- by 40-foot dry-house have been built to house and care for sixty-five men.

During the year the 1,400-foot raise from the 4,100-foot level (elevation of the top of the mill-bins) to the 2,700-foot level (elevation of head of the incline) was holed through and is now being put in order for the handling, between these points, the total production of the Britannia mines.

This raise, having a total height of 1,400 feet, was put through without an accident of any kind, although two men, engaged in drawing the muck from the raise after it had been holed, had a narrow escape owing to the midwall between the chute and the manway giving way and allowing the muck to fall down the manway, blocking and partly wrecking the same. Luckily the men were in a station (700 feet from the bottom) when this occurred and were not injured by the falling debris.

Rescue crews were immediately put to work to ascertain the fate of the two men and attempts were made to reach them from below, but after two days this was abandoned, as there appeared to be a greater likelihood of more men being lost than of reaching the missing men. An attempt to reach the men from the top was then made, and after five days' sinking and timbering through the loose debris the men were reached and found to be, apart from a little suffering from exposure, in fair condition. After being shut in for over seven days they were able, after receiving a little stimulant, to climb, unassisted, to the station above. Much credit is due to the management and men engaged in this difficult and dangerous rescue operation.

The company is now engaged in the preparation and construction of a new mill and concentrator embodying approved modern advances in the preparation of concentrates and having a capacity of 2,500 tons a day.

There was one fatal accident at this mine during 1921; this occurred near the portal of the *Victoria*, where a trammer was killed by a moving car.

The above mines were found to be well ventilated and the provisions of the "Metalliferous Mines Inspection Act" appear to be fully observed.

Bowena. This property is situated on the eastern shore of Bowen island, near Deep Cove, and is owned by the Bowena Copper Mines, Limited. The mine was operated for a few weeks by a small crew under H. Gerhardi and then closed down. The mine and mill (100 tons capacity daily) are very conveniently situated for shipping, as they are on the shore on the eastern coast of Bowen island about 12 miles by steamship from Vancouver.

Sunloch.—This property is situated near the mouth of Jordan river and is about 40 miles from Victoria. Apart from a little prospecting, nothing has been done at this property during 1921.

Clayburn. These mines are owned and operated by the Clayburn Brick Company and produce the different clays required in the manufacture of brick, firebrick, sewer-pipe, and other products of that nature. The seams of clay have a slight dip and are worked on the pillar-and-stall system, the places being driven 12 feet wide and 6 to 10 feet high. The roadways are well timbered and the ventilation, which is natural, is good. There was one fatal accident during 1921, a miner named De Lella being so severely injured by material from a shot that he died.

There are several openings in the different seams and the mines are worked intermittently, the same crew of men being moved from mine to mine according to the kind of clay required at that particular time. The mining operations are under the direction of Elijah Priest, mine manager.

NORTHERN INSPECTION DISTRICT.

REPORT BY T. J. SHENTON, INSPECTOR.

I have the honour to submit my annual report for the Northern Inspection District, consisting of the Portland Canal, Nass River, Skeena, Queen Charlotte, and Atlin Mining Divisions.

ATLIN MINING DIVISION.

This Division was not visited by me during the current year, as arranged by the Department; I therefore have no report for this section.

PORTLAND CANAL MINING DIVISION.

SALMON RIVER SECTION.

Premier. In this section is situated the *Premier* mine, operated by the Premier Gold Mining Company, Limited. D. L. Pitt, general manager; B. Smith, assistant manager; D. McDonald, mine superintendent. The mine is on the Salmon river, 14 miles from tide-water at the head of the Portland canal. The mine officials have been intensely active during the year in the erection of buildings, consisting of bunk-houses, dry and wash rooms; in the instalment of a steam-heating plant and a hospital, now completed, and in charge of Dr. G. E. Bayfield. In addition, the 150-ton mill has been completed and has been in operation for several months; the aerial tramway, 11½ miles long, has been completed and began operation about December 20th of this year. Two large compressors coupled to two Diesel units have been installed and are now in operation. A concrete foundation at Cascade creek has been put in ready for the machinery for the main power-house, which, it is expected, will be completed early in the spring of 1922. The mine has been in continuous operation during the year, excepting a two-week interval in May due to wage dispute.

The average number of men employed for the year was 382. Total length of tunnel and drifting, 4,027 feet; total of diamond-drilling accomplished for the same period, 6,821 feet. About 50 feet from entrance to No. 2 tunnel a small shaft, 5 by 6 feet, has been sunk during the year to a depth of 420 feet, connecting Nos. 3 and 4 workings; it is supplied with steel cage with guides and safety-catches, and is used for the purpose of hoisting and lowering men and material. Five persons are permitted to ride on each cage.

In the many visits of inspection made by me during the year I have found the management always ready to co-operate in the rigid operation of the law, and all matters within the mine and upon the surface to be proceeding in accordance with the "Metalliferous Mines Inspection Act."

BEAR RIVER SECTION.

Swamp Point. This mine is situated some 30 miles from Stewart, on the Portland canal, and is owned and operated by the Granby Consolidated Mining, Smelting, and Power Company. The mine was closed down for several months during the fall of 1920 and began operations again in the month of March of the present year. The material mined is limestone, which is shipped by scows to Anyox as flux for smelting purposes. The manager is Bert Wing, who was appointed when resumption of work took place. The average number of men employed was eight and the total output in limestone 15,734 tons. The entire operation I have found to be carried on in strict conformity to the stipulations of the "Metalliferous Mines Inspection Act."

NASS RIVER MINING DIVISION.

OBSERVATORY INLET.

At the head of this inlet is situated the mines of the Granby Consolidated Mining, Smelting, and Power Company, the *Hidden Creek* and *Rambler*, in the locality of Anyox.

Hidden Creek. The official staff of present management consists of H. S. Munro, general manager; J. A. Bancroft, assistant manager; J. Tuttle, Jr., mine superintendent; and J. Swanson, mine foreman. Operations have been continuous through the year. Early in the year there was a loss by fire of the main crusher No. 2 at the mine, and another new crusher, No. 3, being prepared for future operation had to be hurriedly pushed to completion. The rebuilding and installation of the new No. 2 crusher was not completed until the month of October; the structure is concrete and fire-proof. E. E. Campbell, previously assistant manager, left the company's service early in the year and his place was filled by Dr. Bancroft.

This year the output of the mine for a single day was broken, being an increase over that of any other day's output in the history of the operation. The average number of men employed was 212, as against 385 for the year 1920. During the year there were two accidents which, while rather serious, were not fatal. The small number of accidents in so large an employment is in a very considerable measure due to the strict co-operation of the management in the application of the "Metalliferous Mines Inspection Act" and the commendable system of operation. On all occasions of my visits of inspection I have found all conditions respecting the "Metalliferous Mines Inspection Act" being rigidly adhered to.

Rambler. This mine is situated about 1½ miles directly west of the smelter-site and the product is quartz used for fluxing. The operation of the mine is under the charge of T. Oxley, and during the present year has not suffered one accident. In this, as that of the *Swamp Point* mine, part of the operation is on the surface, and the quartz produced on the surface is put down through chutes into the cars in the tunnel driven beneath, and from thence is carried by tram to the bunkers near to the smelter. It is found necessary at times to break the large lumps of quartz with hand-hammer before transporting, and to prevent the eyes of the men being injured by pieces of rock the company very willingly agreed, at the suggestion of the Inspector, to the use of wire goggles, a perfect preventive of accident in the case. The average number of men employed for the year was twenty-three and the tonnage in output 22,773 tons. In all inspections made during the year I have found the conditions to agree with the "Metalliferous Mines Inspection Act."

Golskiesh. This mine is situated about 3 miles south of Granby harbour on Deep bay; it is operated by the Golskiesh Mines, Limited, and is managed by W. H. Heidman. The product is a flux, which is sold to the Granby Consolidated Mining, Smelting, and Power Company and is conveyed from the mine to the wharves in Granby bay by the company's scows. A small gas-driven compressor furnishes the power for drilling purposes. The average number of men employed for the year was ten and the output was shipped to the Granby smelter. In all of my inspections of this operation during the year I have found the same to be carried on in accordance with the "Metalliferous Mines Inspection Act."

ALICE ARM.

From the head of this arm a distance of 18 miles along the Kitsault river, in a north-easterly direction, is situated the mines of the Taylor Engineering Company. Connecting tide-water with the mines is a narrow-gauge railway, over which the ore from the mines is transported to the bunkers at the wharves situated at the head of the bay. The present management consists of C. B. North as general manager and J. Milligan as assistant manager.

Dolly Varden.—An unusually short period of operation took place this year; the mine was opened up in the early part of the month of August and closed down in the latter part of the month of September. For the time of operation there was employed on an average twenty-two men.

Wolf.—This property, operated by the same company, is 3 miles farther north from the *Dolly Varden* property, and during the present year, with the exception of the operation of the new power-house situated on this property, the mine has been idle. In my inspections of the operation I have found the prevailing conditions to be fairly in accord with the "Metalliferous Mines Inspection Act."

North Star.—This property joins that of the *Dolly Varden* mine and is owned by the McAleenan Bros., of Alice Arm, and is under the supervision of J. McAleenan. During the present year this property has been idle, and from the dump of the same about 85 tons of ore was shipped to the smelter by the *Dolly Varden* management.

OMINECA MINING DIVISION.

SKEENA SECTION.

Silver Standard.—This mine is situated on Glen mountain in the vicinity of Hazelton. Owing to high prices of material, a low market for silver, and other disadvantages, such as freight rates of railway, etc., the mine was closed in the fall of 1920, and during the present year has remained so. The metal market having improved during the latter part of the present year, it is understood that the company expects to resume operations early in the coming year.

Delta Copper Co.—This company's mine is situated on the Rocher Déboulé hill in close proximity to that of the *Rocher Déboulé* mine, in the district of Hazelton. Under the supervision of Mr. Norrie-Lowenthal some diamond-drilling was done during the months of July and August and four men were employed. The work terminated at the end of August.

HUDSON BAY MOUNTAIN.

Very little work has been done in this section this year. I made one visit to the properties owned by Mr. Aldridge, Donald Simpson, and Kelly, situated on this hill. These properties are situated about 13 miles from Smithers, and the *Premier* group, or *Kelly* claims, were in operation at the time of my visit, four men being employed. The *Victory* group and the *Aldridge* group were idle. The *Empire* group, owned by D. Simpson, was being developed at the time and the work was continued until the month of September, when Mr. Simpson ceased for the winter.

The Duthie Ship Company's representative, J. Turner, came in in the month of November and entered upon the further development of the properties owned by Mr. Aldridge, called the *Mamie* group of claims. At present two men are employed in development-work; also a cook.

Grouse Mountain.—This mine is situated on Grouse mountain, about twenty miles north-east of the town of Telkwa. It was under bond for the year 1920 to the Cassiar Crown Copper Company. The mine ceased operation in the fall of said year and has not resumed operation to present date.

QUEEN CHARLOTTE MINING DIVISION.

Moresby Island.—Within the harbour of Ikeda is situated the *Ikeda* mine, which ceased operation in July of year 1920. At the time the reason given by the secretary for the cessation of work was that the property had been taken over by a new Japanese mining company. The mine has remained closed since the fall of last year.

Collison Harbour.—Within this harbour is situated the *Thunder* group of claims, owned by Ike Thompson, of Jedway. During the present year these claims have been under option to a syndicate, I was informed, which intends to begin active operations in the spring of 1922.

Copper Island.—Work of development of this property by the owner, A. Heino, has proceeded during the year, but no shipments of ore have been made.

South Easter Mine, Graham Island.—This property has not done anything during the year.

Burnaby Island.—The *Mother Lode* and the *Bank of Commerce* claims of this island have been in operation on a small scale. Mr. Campbell and Wilds, the owners have done considerable development-work during the year.

Shuttle Island.—This group of claims, owned by a Vancouver party, has not done any development-work during the year.

Gold Harbour.—Two men have been employed on the claims of the *Early Bird* group, in the persons of T. S. Davey and Nels Pearson, during the year.

Blue Mule Group.—This group of claims within the Kootenay harbour is leased by J. H. Jones and Nels Larson, who have been developing the claims during the present year.

SKEENA MINING DIVISION.

COAST SECTION.

During the year the operation of the present holdings in the property of the *Drum Lummon* mine has been under the hands of a new ownership—Glenville A. Collins Engineering Company, Limited. Operations began in the middle of the summer and an average of four men was employed until nearly the end of the year. A small shipment of some 4 tons of ore was made in the month of October.

Belmont-Surf Inlet.

This mine is situated on Princess Royal island, about 100 miles south of Prince Rupert, and is owned by the Belmont-Surf Inlet Mines, Limited. The officers of the company in charge are: F. H. Penn, manager; P. W. Racey, engineer; and C. P. Seale, mine superintendent. The predecessor of Mr. Penn (F. W. Holler) left the service of the company in the month of April of the year, and Mr. Penn was promoted to take the position. The average number of men for the year will be 200. The number of accidents for the year was five, one of which was fatal. The internal workings of the mine from a safety standpoint are, if anything, in advance of similar conditions prevailing in many of the other mines of my district, but I regret that, notwithstanding, the percentage of accidents for the number of men employed has been considerably greater. For the violation of mine regulations, approved by the "Metalliferous Mines Inspection Act," Charles Palmergerg and Charles Graham were convicted during the present year and were each fined $10.

In the month of October of the year P. W. Racey, engineer of the company, with other officers of the company, including Dr. Allen Beach, has taken pains in raising a class of seventy students in the study of first-aid work, which is a very creditable beginning. The matter is of the most intense necessity and will be of the greatest possible help in rendering efficient aid to the injured, and an important aid to the prevention of accident in the possession of more knowledge among the employees.

Pugsley.

This property, also owned by the Belmont-Surf Inlet Mines, Limited, emerged into a full mine in the month of October of the present year; development on a small scale had been continued during the former part of the year. Only a few men, some four or six, had been previously employed up to the month of October, after which preparations were being made for the increase necessary for a larger production. A short distance from the mouth of the mine the company has built ore-bins in size 150 tons, into which the output of the *Pugsley* mine will be delivered. A connection by aerial tram from this point to the ore-bins at the head of the *Surf* mine; it is a 2-bucket, high-speed, reversible type; capacity of bucket, 1,500 lb.; span between terminals, 2,300 feet; operated by a 25-horse-power motor. Capacity of tram in eight hours is 100 tons and elevation between terminals is 390 feet. In my inspections of both these properties during the year I have found the conditions to agree fairly with the "Metalliferous Mines Inspection Act."

COAL-MINING IN BRITISH COLUMBIA.

By Wm. Fleet Robertson, Provincial Mineralogist.

During the year 1921 there was mined in the various collieries of the Province 2,569,639 tons (2,240 lb.) of coal, a decrease from the preceding year of 127,135 tons, equivalent to about 4.3 per cent.

The output of coke was 59,434 tons as compared with 67,792 tons in 1920, a decrease of 8,358 tons or 12.3 per cent.

The following table shows, for the past eleven years, the output and the *per capita* production of the various districts:—

Output and Per Capita Production of Various Districts.

Year.	District.	Gross Tons of Coal mined during Year.	Total No. of Employees at Producing Collieries.	Tons of Coal mined per Employee for Year.	Number of Men employed Underground in Producing Collieries.	Tons of Coal mined per Underground Employee for Year.
1911	East Kootenay District	442,057	2,197	201	1,585	272
	Coast District	1,855,661	4,676	397	3,627	511
	Whole Province	2,297,718	6,873	334	5,212	440
1912	East Kootenay District	1,261,212	2,410	523	1,780	708
	Coast District	1,764,497	4,720	374	3,495	504
	Whole Province	3,025,709	7,130	424	5,275	574
1913	East Kootenay District	1,331,725	2,666	500	1,965	678
	Coast District	1,239,035	3,777	328	2,865	433
	Whole Province	2,570,760	6,443	399	4,830	532
1914	East Kootenay District	955,183	2,397	399	1,749	547
	Coast District	1,211,245	3,335	363	2,518	481
	Whole Province	2,166,428	5,732	379	4,267	508
1915	East Kootenay District	852,572	1,748	488	1,183	721
	Coast District	1,120,008	3,230	347	2,512	446
	Whole Province	1,972,580	4,978	396	3,695	534
1916	East Kootenay District	882,270	1,674	527	1,125	784
	Coast District	1,603,310	3,386	474	2,569	624
	Whole Province	2,485,580	5,060	491	3,694	673
1917	East Kootenay District	551,751	1,481	372	944	584
	Coast District	1,846,964	3,689	501	2,816	656
	Whole Province	2,398,715	5,170	463	3,760	638
1918	East Kootenay District	732,864	1,327	552	814	900
	Coast District	1,845,860	4,100	450	2,844	645
	Whole Province	2,578,724	5,427	475	3,658	705
1919	East Kootenay District	558,806	1,369	409	1,000	559
	Coast District	1,850,142	4,597	402	3,145	588
	Whole Province	2,408,948	5,966	404	4,145	581
1920	East Kootenay District	847,389	1,582	536	1,062	798

	Coast District	1,809,884	5,111	354	3,515	515
	Whole Province	2,569,639	6,885	373	4,722	544

While no figures can be given as to the actual cost of mining in the different fields, the *per capita* production of these fields is of interest, as having a bearing upon the working costs and as indicating the mining facilities existing and the improvement made in these conditions from year to year.

The *per capita* production varies from year to year and this variation is very often caused by different conditions which last for a longer or shorter time. For example, explosions, new developments, and the opening-up of new mines or closing of old ones are variable factors which affect the *per capita* production from year to year.

It will be seen from the foregoing table that the production *per capita* was high in 1912, but that the years 1913, 1914, 1915, and 1919 show a decrease, especially in the Coast District. This decreased effectiveness, during the last few years, of the labour employed is largely due to the extension of the workings of the mines, causing a greater length of haulage and greater extent of old workings to be taken care of, but some of the increased labour is undoubtedly on account of the greater number of men employed in safeguarding the mine and workmen. In the year 1917 it will be observed that while the *per capita* output of the Coast collieries also shows an increase, the Crowsnest District shows a very considerable decrease, which is caused by the fact that a large amount of the underground labour in these collieries is engaged in non-productive work, such as repairing the damage from the former explosion and in opening up a new system of mining which it is expected will tend to greater safety of employees and also of the property.

The *per capita* production for 1920 shows a substantial increase over that of 1919, particularly in the East Kootenay District, but it is to be regretted that in 1921 the *per capita* production has fallen back again.

The market of the East Kootenay field is provided primarily by the railways of the south-eastern part of the Province and of the northern parts of the adjoining States of Montana and Washington, approximately three-quarters of the coal, sold as such, being exported to those States, while the remainder went to supply the demands of the south-eastern part of the Province —its domestic needs, its railways, steamboats, mines, and smelters. The competition of fuel-oil, frequently referred to in the past, has diminished to some extent owing to increased prices of fuel-oil.

Coke, a product of the coal-mines, is sold in the same markets, with the difference that the local consumption—chiefly by the smelter at Trail—took about 70 per cent. of the product, while 30 per cent. was exported to the States mentioned.

As regards the marketing conditions in this field, the East Kootenay collieries are, however, brought into direct competition with the collieries of Alberta, just over the Provincial boundary-line, all these collieries being in the same coalfield, with practically the same grade of coal and working under similar conditions.

The Coast District may be subdivided into two fields—the Nicola-Princeton field and the Vancouver Island field—in which the markets differ considerably.

The new coalfield on the Telkwa river, in Omineca Division, this year produced 800 tons of coal which was sold locally. The production of this field has been included in the Coast District.

In the Nicola-Princeton field the consumption is chiefly by the local railways, while a small amount finds its way to Vancouver, even under the handicap of what seems to be an excessively high freight charge.

The Vancouver Island coal market is provided by the domestic and manufacturing requirements of the Coast cities, and of the ocean-going steamers calling at these ports.

The larger coasting steamers and railways, which in later years have all been using California crude oil as fuel, are to some extent reverting to the use of coal, which will mean an increased production from Coast collieries.

As in former years, the greater proportion of the coal production was made by three larger companies—the Crow's Nest Pass Coal Company, with two collieries in East Kootenay; and by the Western Fuel Corporation (formerly Canadian Western Fuel Company), of Nanaimo, and the Canadian Collieries (Dunsmuir), Limited, these last two operating on Vancouver island.

In addition to these large collieries, shipments have been made by the Corbin Coal and Coke Company, in East Kootenay; by the Middlesboro Collieries, Fleming Coal Company (operating Coal Hill Colliery), Coalmont Collieries, Limited, in the Nicola Valley, and the Chu Chua

Colliery, on the North Thompson river; by the Princton Coal and Land Company, of Princeton; by the Pacific Coast Coal Mines, Limited, East Wellington Coal Company (formerly British Columbia Coal Mining Company, which was the Vancouver Nanaimo Coal Company), and Nanoose Collieries, Limited, all operating on Vancouver island, near Nanaimo; and by Granby Colliery No. 1 at Cassidy. Telkwa Collieries Company, of Telkwa, did not produce in 1921, but a new colliery—the Aveling Colliery—mined and sold locally 800 tons,

The details of the shipments made by each of these companies will be found in reports of the Inspectors of the various districts.

During the year 1921 about 60.9 per cent. of the coal, sold as such by the collieries of the Province, was consumed in British Columbia; and the remainder, 39.1 per cent., was exported to the United States, including Alaska. Of the coke sold, about 70 per cent. was consumed in British Columbia, and the remaining 30 per cent. was exported to the United States.

COLLIERIES OF THE COAST DISTRICT.

The gross output of the Coast District collieries, including the Nicola valley and Telkwa, for the year 1921 was 1,809,884 tons (2,240 lb.) of coal actually mined, while some 24,330 tons was taken from "stock," making the actual consumption of coal 1,834,214 tons.

Of this gross consumption, 1,485,415 tons was sold as coal, 152,898 tons was consumed by the producing companies as fuel, and 190,148 tons was lost in washing. No coke was made this year by the Coast collieries, but coal mined at some of the Vancouver Island collieries was sold to the Granby Company's Anyox smelter, where it was subsequently made into coke in by-product ovens by the Smelting Company for its own use.

Formerly, in 1902, the Coast collieries exported to the United States 75 per cent. of the coal they mined, but later these conditions changed very much, as is shown by the following table:—

TABLE SHOWING PERCENTAGE SALES DISTRIBUTION OF COAST DISTRICT COAL.

Year.	Used in Canada.	Exported to U.S.	Exported to other Countries.
1910	71.30	24.50	....
1911	76.10	21.60	2.30
1912	71.25	21.25	7.47
1913	89.80	10.20	....
1914	77.30	22.70	....

1919	72.00	28.00	....
1820	79.00	20.00	1.00
1921	78.47	21.53	....

COLLIERIES OF THE EAST KOOTENAY DISTRICT.

The gross output of the collieries of the East Kootenay District for the year 1921 was 759,755 tons (2,240 lb.) of coal actually mined, while 13,859 tons was added to stock, making the actual consumption of coal 745,896 tons. Of this gross consumption of coal, 599,592 tons was sold as coal, 60,660 tons was consumed as fuel by the producing companies, while 85,644 tons was converted into coke, producing 59,434 tons of coke; 536 tons of coke was taken from stock, making the coke sales for the year 59,970 tons.

The East Kootenay collieries exported to the United States about 70 per cent. of the coal sold and about 35 per cent. of the coke.

The following table gives complete details of the coal and coke production of the Province for 1921, with the output figures for each colliery and district totals:—

Collieries of British Columbia—Production, 1921.

Mine.	Sold.			Total Sales.	Lost in Washing.	Used in making Coke.	Used under Co.'s Boilers, etc.	Total for Colliery Use.	Stocks.		Difference.		Output for Year 1921.

NOTE.—U=underground; A=above ground; T=total.

INSPECTION OF COAL-MINES, 1921.

The coal-producing areas of the Province are divided into the Coast District, which includes the Vancouver Island, the Nicola-Princeton, and the Telkwa coalfields, and the East Kootenay District.

COAST DISTRICT.

This district, comprising, as it does, the coalfields of Vancouver island and the Coast, as well as those of the Nicola and Similkameen valleys, has been subdivided, for inspection purposes, into three Inspection Districts.

Two of these Inspection Districts are on Vancouver island, with headquarters for both at Nanaimo, which permits of one of the Inspectors being constantly at headquarters while the other is making inspections; it also permits of the interchanging of inspection duties, so that each Inspector knows both districts.

The third district is the Nicola-Princeton Inspection District, with headquarters at Merritt. In June, 1920, John G. Biggs was appointed to the inspectorate of this district.

NANAIMO INSPECTION DISTRICT.

HENRY DEVLIN, INSPECTOR (OFFICE, NANAIMO).

The Canadian Collieries (Dunsmuir), Limited—Nos. 1, 2, and 3 mines, all worked from what is known as the No. 1 tunnel, and No. 5 mine at South Wellington.

Granby Colliery No. 1 at Cassidy—3 slopes.

Pacific Coast Coal Mines, Limited—The Morden mine.

Nanoose Collieries, Limited—No. 1 mine.

Western Fuel Corporation of Canada (formerly Canadian Western Fuel Company)—Harewood, Reserve, and Wakesiah.

East Wellington Coal Company.

Adit mine, Old Wellington Colliery.

COMOX INSPECTION DISTRICT.

(INCLUDING No. 1 AND PROTECTION SHAFTS, NANAIMO.)

THOMAS R. JACKSON, INSPECTOR (OFFICE, NANAIMO).

Western Fuel Corporation of Canada (formerly Canadian Western Fuel Company)—Protection and No. 1 mines.

The Canadian Collieries (Dunsmuir), Limited—Nos. 4 and 7 slopes and No. 5 shaft.

Pacific Coast Coal Mines, Limited—Suquash Colliery.

NORTHERN INSPECTION DISTRICT.

T. J. SHENTON, INSPECTOR (OFFICE, PRINCE RUPERT).

The Telkwa Collieries—Mine at Telkwa; and the Aveling Colliery, also on Telkwa river.

NICOLA-PRINCETON INSPECTION DISTRICT.

JOHN G. BIGGS, INSPECTOR (OFFICE, MERRITT).

The collieries operating during the year in this Inspection District, including the new mines that have been started, were:—

The Middlesboro Colliery of the Middlesboro Collieries, Limited, Merritt—Nos. 2, 3, 4, 5, 6, and 7 mines.

Fleming Coal Company.

Princeton Coal and Land Company's Princeton Colliery—No. 1 slope.

Coalmont Collieries.

Chu Chua Colliery.

EAST KOOTENAY DISTRICT.

The East Kootenay District is subdivided into two Inspection Districts—i.e., Northern Inspection District and Southern Inspection District. Both these districts are inspected by Robert Strachan as Senior Inspector, and John McDonald, Inspector with headquarters at the Mine-rescue Station at Fernie.

The collieries operating during the year were Coal Creek Collieries, Michel Colliery, and Corbin Colliery.

NANAIMO INSPECTION DISTRICT.

REPORT BY HENRY DEVLIN, INSPECTOR.

I have the honour to submit my annual report for the year ending December 31st, 1921, on the various coal-mines in my inspectorate, consisting of the Reserve, Harewood, and Wakesiah mines of the Western Fuel Corporation of Canada, Limited, Nanaimo (formerly Canadian Western Fuel Company); Nos. 1, 2, and 3 mines. Extension, and No. 5 mine, South Wellington, Wellington-Extension Colliery of the Canadian Collieries (Dunsmuir), Limited; Granby No. 1 Colliery of the Granby Consolidated Mining, Smelting, and Power Company, operating at Cassidy; Lantzville mine of the Nanoose-Wellington Collieries, operating at Nanoose; and the Old Wellington Colliery, Wellington, operated by King & Foster.

Western Fuel Corporation of Canada, Ltd.

(UNTIL JUNE 1ST, 1921, KNOWN AS THE CANADIAN WESTERN FUEL COMPANY.)

Head Office—Nanaimo, B.C.

Capital, $1,500,000.

Officers.	*Address.*
C. P. Heaton, President,	San Francisco, Cal.
G. W. Bowen, Vice-Chairman,	Nanaimo, B.C.
Mark Bate, Jr., Secretary-Treasurer,	Nanaimo, B.C.
John Hunt, General Superintendent,	Nanaimo, B.C.
Robert Laird, Mine Manager, No. 1 Mine,	Nanaimo, B.C.
Robert Henderson, Mine Manager, Reserve Mine,	Nanaimo, B.C.
Arthur Newbury, Harewood Mine,	Nanaimo, B.C.
William H. Moore, Wakesiah Mine,	Nanaimo, B.C.

The above company has operated the following collieries at Nanaimo during the past year, namely: No. 1 or Esplanade shaft, Nanaimo; Protection Island mine, Harewood, and Reserve.

The following returns show the combined output of all the company's mines for the past year:—

AGGREGATE RETURNS FROM WESTERN FUEL CORPORATION'S MINES FOR YEAR 1921.

NANAIMO COLLIERY.

REPORT BY THOS. R. JACKSON, INSPECTOR.

Robert Laird, Manager.

No. 1 SHAFT, ESPLANADE.

Edward A. Courtenay, Overman; Robert Adams, William Johnson, William Halliday, John Hamilton, James McMeakin, James Dudley, Thomas Blenkhorne, George Gardine, Joseph Dykes, Joshua Norris, Thomas J. Woods, George Perry, John Shipley, Joe Dean, Andy Bennett, George Moore, Joe Dykes, and Neil McMillan, Firebosses.

This mine is situated at the south end of the Esplanade and adjacent to the bay shore-line. It is the oldest working-pit in Nanaimo district and has a large submarine area. The mine has three openings; two of them are in daily operation—namely, No. 1 and Protection shafts. The latter is situated on Protection island. The third opening is Newcastle shaft. A ladder extends from top to bottom of this shaft, so that one can enter or leave the mine. It is used only for inspection or necessity; it also forms the exit for the return air of Newcastle airway. The men working in Protection mine are conveyed by scow to and from there. No. 1 shaft provides passage-way for men employed in the South side of mine.

Electric lamps of the Edison type are now used. Douglas and Newcastle seams are worked. On the South side of mine the Douglas seam is worked exclusively; on the North side of mine coal is taken from both seams. In blasting nothing but permitted explosives are used and fired by cable and electric battery. Compressed air and electricity are used as motive power for haulage and drainage purposes. The three Prescott pumps are driven by steam; so are the endless haulage-rope and Diagonal slope engines; all of them situated at the shaft-bottom.

The North side haulage system consists of heavy steel rails and copper trolly-wire on the Main level, approximately 3 miles in length, extending from No. 1 shaft to the foot of Lamb's incline. Five motors are used; four constantly running; one acts as spare. Four of them are of the Edison type and one Westinghouse type—10-ton; all are spring-trolly connected. Horses and mules with drivers are used to take the cars to the faces and return with loaded cars to the main roads. Small and large winches are employed to attend to these cars and place them on the motor-road; the motors haul them to the shaft-bottom. A 12-ton Jeffrey motor has been added lately.

The South side haulage system consists of direct, endless rope, and main and tail rope. The workmen are supplied with cars in a similar manner to North side of mine, with this difference: instead of motors hauling the cars to the shaft-bottom, engines and ropes are used to do the work.

Development-work done in South Side, No. 1 Mine.

In the Main slope the two rock tunnels known as No. 8 South levels have been driven in a distance of 600 feet, but so far only small pockets of coal have been found. No. 5 North levels

off the Main slope have been driven in a distance of 700 feet, but only one small pocket of coal has been struck.

In No. 3 dips off No. 3 North level reopening-work has been carried on since May. Some good coal has been found in this section, but owing to heavy water and the difficult nature of the ground reopening-work has been slow. At a point 1,000 feet in No. 3 level active development-work has been carried on in a large area on the West side; the results have been very satisfactory in this section.

No. 4 South levels off the Diagonal slope have been continued to a point about 2,000 feet from the slope with good results. About the middle of the year the old workings known as Old Diagonal slope, which had been standing full of water since the explosion thirty-four years ago, was successfully tapped and all water drained off. Owing to the irregular nature of the ground six bore-holes from 75 to 100 feet deep were put in before water was struck. In No. 1 slope off the main and tail roadway a rock tunnel has been driven in a distance of 250 feet with good results.

Development-work done in North Side of No. 1 Mine.

During the year active operations have been carried out in the Douglas seam at Lamb's incline. At this point the coal is only 2 feet 9 inches thick, but is of good quality. The main air-line was extended along the Main level from No. 3 wall entrance to Lamb's incline and the Pick-quick machines introduced with good results. This section is worked in the long-wall system, mining being done in the bottom.

In the Diagonal slope, Protection, reopening-work has been carried on during the year. The water has been pumped out for a distance of 1,400 feet from the shaft. At a point down the slope (750 feet) a long-wall section has been opened up on the North side. This section had to be abandoned some time ago as the coal got too thin to work.

Reopening-work is also being carried on in Protection slope. The water has been pumped out to a point 1,300 feet from the shaft and some good coal is being recovered. No. 1 and No. 2 inclines have also been reopened. Pillar-work is carried on under restrictions.

North Side, No. 1 Shaft.

In the Douglas seam the work done is chiefly the extraction of pillars; the thickness of the seam varies from 3 to 7 feet. The Newcastle seam averages 3 feet in thickness and is worked by the long-wall system. Most of the output of coal is produced by mining-machines. The machines used are Pick-quick and Siskoll. Where the ground is faulty or the face is not extensive the mining is done by a Siskoll machine; where there is sufficient length of face to warrant it the Pick-quick machine is used. Both machines give good results. Compressed air is the motive power. Both machines undercut the coal to a depth of 6 feet, after which it is drilled and shot down. The brushing is taken out the floor to admit the car to the face; car carries about 16 cwt. of coal. Regulation size of place equals 12 yards, with roadway in centre. Loaders load out the coal into cars. Eight loaders are supervised by one shotlighter, or fireboss. Four loaders are supervised by one faceman, who is a certificated miner; a loader does not need a miner's certificate to load coal. Portions of the long-wall face are worked by diggers.

At present coal from the pillars in the Douglas seam is being taken from the following sections in the North side of mine: No. 1 wall, No. 2 wall, Protection slope, and Lamb's incline.

The ventilation of these districts is produced by a Guibal fan, 9 by 18 feet, rope-driven, at 70 revolutions a minute, against a 2-inch water-gauge. During my last inspection I measured 47,000 cubic feet of air a minute passing up Protection slope, divided into four splits.

Protection Level Section.—There was 8,000 cubic feet of air a minute passing for the use of thirty-six men and seven horses. Found no gas and section free from coal-dust. General conditions fairly good.

Lamb's Incline Section.—There was 6,000 cubic feet of air a minute passing for the use of twenty-seven men and seven mules. Found no gas and section free from coal-dust. General conditions good.

Nos. 3 and 4 Long-wall Sections.—There was 11,200 cubic feet of air a minute passing for the use of fifty-six men and eight mules. Found no gas and section free from coal-dust. General conditions good.

Nos. 1 and 2 Walls, Upper Seam Section.—No. 1 Upper: There was 6,000 cubic feet of air a minute passing for the use of thirty-five men and five mules. Found no gas and section fairly free from coal-dust. General conditions good. No. 2 Upper: There was 7,000 cubic feet of air a minute passing for the use of twenty-six men and four mules. Found no gas and section fairly free from coal-dust. General conditions good.

Measured 20,400 cubic feet of air a minute passing in Newcastle airway. Last test of Burrell gas-detector showed 0.2 per cent. methane. In 73,500 cubic feet of air a minute passing near upcast shaft, last test of Burrell gas-detector showed only 0.1 per cent. of methane.

South Side, No. 1 Mine.

Alex. Coombs, James S. Brown, William Neave, George B. Bradshaw, John Marrs, John Weeks, John Sutherland, Matthew Broderick, John Devlin, and John McArthur, Firebosses.

The workings are all in the Douglas seam and almost consist of extractions of pillars. The seam varies much in thickness and inclination; some of it 2 feet and other parts as high as 15 feet; inclination running from horizontal to 10°.

The ventilation is produced by a 72- by 90-inch double-inlet Sirocco fan, rope-driven, ratio 3½ to 1, capable of producing 195,000 cubic feet of air a minute at a 4-inch water-gauge, driven by an engine of 350 horse-power. Another fan capable of producing the necessary ventilation of the mine stands ready to substitute should necessity require.

During my last inspection I measured 43,200 cubic feet of air a minute passing, divided into two splits.

No. 4 South Level Section.—There was 11,160 cubic feet of air a minute passing for the use of thirty-five men and seven mules. Got a little gas in Lewis place. Found section fairly free from coal-dust and general conditions good.

Inside Section.—There was 15,000 cubic feet of air a minute passing for the use of forty-eight men and nine horses. Found no gas and section of mine fairly free from coal-dust. General conditions of mine fairly good.

No. 7 Section.—There was 11,200 cubic feet of air a minute passing for the use of seven men and one horse. Found no gas and section free from coal-dust. General conditions good.

Burrell gas-detector showed 0.1 per cent. of methane in 22,300 cubic feet of air a minute passing in South side return at No. 3 door. Got 69,000 cubic feet of air a minute passing into upcast shaft from South side main airway; last test showed no methane.

The following are the official returns for the Nanaimo Colliery for the year ending December 31st, 1921:—

REPORT BY HENRY DEVLIN, INSPECTOR.

RESERVE MINE.

Robert Henderson, Manager; Frances John, Overman; James McGrath, Shiftboss; Benjamin Cheetham, Albert Manifold, Joseph Thompson, James West, Fred. Bell, George Frater, James E. Knowles, Richard Rallison, Ernest Kelly, Fred. Hilley, Henry A. Meikle, John McCourt, and Jacob Stobbart, Firebosses.

This mine is situated in what is known as the Cranberry district, about 5 miles south of Nanaimo. The coal is reached by two shafts at a depth of 955 feet, from which a rock tunnel 8 by 10 feet in area is driven across the measures on a 1-per-cent. grade to the rise. The tunnel tapped the seam at a distance of 180 feet. The shaft-bottom is laid out in a most up-to-date method for handling a large output of coal. All the tracks are laid with 30-lb. rails and on a grade of 1 per cent. up from the shaft. All the main tunnels leading to this shaft are timbered with 12- by 12-inch timbers.

The seam worked in this mine is the Douglas, the thickness of which varies from 1 to 20 feet. The pitch varies from 10° to 50° and is generally dipping north or north-east. The coal is mostly of a soft nature, with a fairly strong roof.

The coal in No. 1 West heading varies in thickness from 3 to 20 feet, and is of a very good quality and fairly hard. There is a diamond-drill hole down about 1,000 feet in advance of the heading in about 10 feet of coal.

A rock tunnel 8 by 12 feet has been driven on a 1-per-cent. grade back to No. 1 hoisting-shaft and connects with the shaft 110 feet above the present shaft-bottom. This will simplify the haulage and practically make a new mine of it.

The output of this mine has been considerably increased during the year and is the second largest producer of the Western Fuel Corporation.

The ventilation of the mine is produced by a pair of 90-inch Sirocco fans, connected to a 20 by 30 engine, rope-driven. On the engine is a drive-wheel 17 feet in diameter and on the fan-shaft a drive-wheel 5 feet in diameter. These fans, running with an engine-speed of 16 revolutions, are capable of producing 140,000 cubic feet of air a minute, against a 3-inch water-gauge.

The air is carried along the Main levels on both sides of the mine and up the Main headings, and maintained by permanent stoppings of 12- by 12-inch timbers bedded in cement between the intake and return airways; these stoppings are being kept well up to the face of the workings. The Main haulage-roads and working-places are naturally damp and very little explosive gas is found in the workings.

The mechanical haulage is all carried on by means of compressed-air hoists, of which there are twelve in use. The pillars have all been extracted from the East and West levels, but

prospecting is being carried on by means of two pairs of headings about 2,500 feet apart. These headings are being driven up the full pitch of the seam and are in coal of good quality.

The Edison electric head-lamps have been installed in this mine during the year; they are finding much favour with the workmen and are proving very efficient.

The surface plant consists of four return-tubular boilers, 16 by 24 each, 208 horse-power, with a steam-pressure of 125 lb.; one hoisting-engine, 30 by 60 inches, built by Barclay & Sons, Kilmarnock, Scotland, drum 12 feet in diameter, with a 1½-inch galvanized steel-wire rope; one hoisting-engine, 24 by 48 inches, built by Barclay & Sons, Kilmarnock, drum 12 feet in diameter, with a 1½-inch galvanized steel-wire rope; each of the above engines is fitted with an automatic overwinding device. One cross-compound Canadian Rand compressor with a capacity of 25,000 cubic feet of air a minute at 90 revolutions. One Ingersoll-Rand compressor has been installed during the year with a capacity of 22,000 cubic feet of air a minute at 120 revolutions. One electric engine which supplies the light above and below ground, single engine, 14 by 14 inches, built by Robb-Armstrong, with 2 d.c. generators, 250 volts, 120 amperes.

Screens: One 3-car self-dumping tipple with shakers consisting of two screens, 1½ inches and ¾ inch respectively, picking-table, and nut and cross conveyors driven by a small compound engine.

On my last inspection of this mine I measured 50,000 cubic feet of air a minute passing into the mine, divided into two splits.

In the East side split there was 14,880 cubic feet of air a minute passing for the use of forty-eight men and six horses.

In the West side split there was 18,000 cubic feet of air a minute passing for the use of sixty-eight men and six horses.

No explosive gas found. Timbering and roadways were in good condition and the mine free from coal-dust.

Tests made with the Burrell gas-detector were as follows: East side split showing 0.3 per cent. methane in 16,000 cubic feet of air a minute; West side split showing 0.4 per cent. methane in 20,000 cubic feet of air a minute; Main return showing 0.5 per cent. methane in 56,000 cubic feet of air a minute.

The following are the official returns from the Reserve Colliery for the year ending December 31st, 1921:—

WAKESIAH MINE.

William H. Moore, Manager; Thomas Jordan, Overman; Charles F. Webber, Shiftboss; John A. Challinor, Alfred Odgers, Isaac Nash, George W. Nash, George Grey, and Samuel K. Mottishaw, Firebosses.

This mine is situated on the Western Fuel Corporation's farm, about 2 miles from Nanaimo, and is connected by railway with the Harewood branch line. Two shafts were sunk to a depth of 320 feet to the Wellington seam and a pair of levels driven in a south-westerly direction for about 1,400 feet, at which the coal-measures are tilted and thrown up at varying angles and finally cut off by what is known locally as the "Little mountain."

About 700 feet from No. 2 shaft a pair of slopes have been driven, which have cut the large fault to the south-east at about 1,400 feet. New slopes are being driven to further exploit the measures to the south and east.

The pair of headings driven towards the Old Jingle Pot mine, after encountering many disturbances, at last got into an area of good coal and is now being exploited. The coal varies a great deal in thickness—namely, from 2 to 20 feet. The floor is uniformly hard, but there is a very poor roof (except in a few small areas), which requires careful timbering. The coal itself is a very high quality, but is somewhat friable.

The contour of the field is very irregular, which makes haulage both difficult and costly. Haulage is carried on by means of five winches, driven by compressed air, supplemented by horses.

The output is now from 350 to 400 tons a day. A considerable amount of water has been encountered on the line of fault and is handled by seven pumps, six of which are run by compressed air, and the large Cameron pump at the shaft-bottom which is run by steam.

Ventilation is produced by means of a single-inlet Murphy fan, which is now driven direct, but can be changed to belt-driven in a few minutes, an auxiliary engine being kept ready for the purpose.

Ths mine is damp and free from coal-dust. Up to the present time safety-lamps of the Wolf type have been in use, but arrangements are now being made for the installation of the Edison electric head-lamps.

Another and larger compressor than the two in use has been secured, and will probably be installed early in the coming year, to provide power for further developments, larger pipe-lines being already installed for that purpose.

A new feed-water heater has been installed during the year. Coal is being hoisted from No. 2 shaft by a 14- by 16-inch first-motion engine supplied with steam at 120 lb. pressure from two boilers of 160 and 140 horse-power respectively, a $^{6}/_{19}$ 1⅛-inch plough-steel wire rope being used in hoisting. The switching-yards have been extended during the year and a new shaker-engine installed.

The general development of the mine has been retarded by the slackness of the coal trade, due largely to the increased use of fuel-oil.

As a result of the increased vigilance of the officials in the interests of "safety first," there has been no very serious accidents reported during the year, notwithstanding the frail roof and other adverse conditions.

On my last inspection of this mine I measured 26,000 cubic feet of air a minute passing into the mine, divided into two splits.

In the East side split there was 11,450 cubic feet of air a minute passing for the use of thirty-five men and three horses.

In the West side split there was 14,500 cubic feet of air a minute passing for the use of forty-eight men and seven horses.

I found a small quantity of explosive gas in face of the second place off Barton's dip, East side. Timbering and roadways were in good condition and the mine free from coal-dust.

Tests with the Burrell gas-detector were as follows: East side split showing 0.3 per cent. methane in 12,300 cubic feet of air a minute; West side split showing 0.4 per cent. methane in 16,000 cubic feet of air a minute; Main return showing 0.5 per cent. methane in 28,300 cubic feet of air a minute.

The following are the official returns from the Wakesiah Colliery for the year ending December 31st, 1921:—

HAREWOOD MINE.

Arthur Newbury, Manager; John White, Overman.

In this mine the most important development-work during the year was in the South-east levels, which were driven a distance of 1,000 feet, mostly in rock; also the south-west heading was completed for ventilation purposes, it being driven through to the surface. A new slope was driven down from the face of the level a distance of 100 feet, but was abandoned on account of water.

This mine was only operated about five months during the year owing to slackness in the coal trade, and most of the output came from pillar-extraction.

(For description of power-house equipment and plant at the Harewood mine, *see* Minister of Mines' Report for 1919.)

On my last inspection of this mine I measured 10,800 cubic feet of air a minute passing into the mine for the use of eight men and two horses.

No explosive gas found. Timbering and roadways were in good order and the mine entirely free from coal-dust.

Test made with the Burrell gas-detector showed no methane present in the mine-air.

This mine was partly closed down at the time of my visit, only two developing-places being worked, and on December 19th the mine was closed down indefinitely.

The following are the official returns from the Harewood Colliery for the year ending December 31st, 1921:—

The Nanoose-Wellington Collieries Co., Ltd.

Head Office—Wellington, B.C.

Officers.	*Address.*
Grant Waldref, President,	292 Walnut Street, St. Paul, Minn.
J. A. Coleman, Managing Director,	Seattle, Wash.
Russel H. Phinney, Secretary,	St. Paul, Minn.
M. N. Olsen, Treasurer,	Wellington, B.C.
James W. Jemson, Superintendent,	Wellington, B.C.

Value of plant, $200,000.

LANTZVILLE MINE.

James W. Jemson, Manager; Joseph Neen, Overman; John Michek, Charles Simister, Jonathan Pearson, Edward Bridge, James Handlen, Henry Carroll, George Oswald, and Hugh M. Davidson, Firebosses.

This mine is situated at Nanoose Bay, about 9½ miles north of Nanaimo, and is worked in what is known as the Old Wellington seam. The seam is reached by a shaft 8 by 16 at a depth of 133 feet. The seam varies in thickness, but is of excellent quality. There are several layers of rock between the benches of coal and overlaid by cap-rock, which also varies in thickness.

The roof is hard and dependable; therefore the prop and cap-piece system of timbering is generaly sufficient for all purposes. The pillar-and-stall system is general throughout the mine, though where the seam has become thin long-wall has been resorted to.

The larger portion of the output comes from No. 2 slope and is hauled by a compressed-air hoist, but preparations are being made to electrically operate this hoist to enable them to haul a larger trip, and thus be able to handle a larger output. A good deal of grading has been done on this slope during the last few months, which gives a more uniform grade and tends for safer haulage. Considerable improvements have been made at the top and bottom landings of No. 2 slope. At the bottom a very good track arrangement simplifies and expedites the handling of trips. At the top of the slope the track arrangement is very good and works well, which saves the services of two men and two horses in the handling of the trips.

Development-work in No. 3 slope is steadily progressing and will no doubt shortly be in the same field of coal now being mined in No. 2 slope. Therefore, having coal in two slopes, a larger increase in output is expected in the near future.

The Main level is being improved and relaid with 30-lb. steel rails. A series of brick stoppings has been built along the Main airway and partly down No. 2 slope, thereby saving considerable leakage of air. The present mine-fan is about at its limit, and steps are being taken to replace it by one of larger capacity, to be electrically driven and of the most improved type.

A small generator has been installed in the power-house to supply lights to the new houses. The houses received a coat of paint in the fall, which has greatly improved their appearance. They are exceptionally good and are equipped with every modern convenience—hot and cold water, bath, and electric light. The village overlooks the bay and a more pleasant location would be hard to find.

A "jitney" service enables the residents to go to Nanaimo at any time and the Esquimalt & Nanaimo Railway is only about a mile distant. A new school-house is to be built in the near future on a site donated by the company. The building now being used as a school-house will be used as a social hall and class-room.

During the winter months a very successful first-aid class was held and carried to a successful completion, as eighteen of the students succeeded in obtaining certificates and medallions.

This mine is fully equipped with the Wheat electric head-lamp, which is giving general satisfaction, only firebosses using the Wolf-type safety-lamp for testing purposes.

(For description of power-house equipment and plant at Lantzville mine *see* Minister of Mines' Report for 1920.)

On my last inspection of Lantzville mine in December I measured 27,000 cubic feet of air a minute passing into the mine, divided into two splits.

In No. 1 split there was 10,000 cubic feet of air a minute passing for the use of twenty-seven men and six horses.

In No. 2 split there was 14,000 cubic feet of air a minute passing for the use of fifty-five men and four horses.

I found a small quantity of explosive gas issuing from a feeder in the floor at the face of No. 2 slope. Timbering and roadways were in good condition and the mine free from coal-dust.

Tests made with the Burrell gas-detector showed no methane present in the mine-air.

The following are the official returns from the Lantzville Colliery for the year ending December 31st, 1921:—

Name of seams or pits—Old Wellington. Coal extracted from one seam only.

Description of seams, tunnels, levels, shafts, etc., and number of same—Coal is hoisted from shaft, which acts as intake airway. Tunnel acts as fan-drift and return airway, which is also exit for men and horses. Air-current is divided into two splits.

Description and length of tramway, plant, etc.—Practically 7,000 feet of tramways. Three boilers, total horse-power 360; two compressors, total capacity 950 cubic feet a minute.

First-motion hoisting-engine. Electric power is generated by 150-kw. generator, used for all surface work, washing, screening, and operating 75-horse-power electric winch in mine. One Sturtevant fan, electrically operated, capacity 30,000 cubic feet a minute.

Granby Consolidated Mining, Smelting, and Power Co. Colliery at Cassidy.

Officers.	*Address.*
W. L. Nichols, President,	52 Broadway, New York.
J. T. Crabbs, Vice-President,	52 Broadway, New York.
Edward Everett, Secretary,	52 Wall Street, New York.
Valentine Quinn, Treasurer,	813 Birks Blds., Vancouver.
H. S. Munroe, General Manager,	Anyox, B.C.
C. M. Campbell, Superintendent,	Cassidy, B.C.

GRANBY No. 1 COLLIERY.

Charles M. Campbell, Resident Manager; James Touhey, Mine Manager; William P. Touhey, Overman; Jonathan Henney, Shiftboss; John Wright, Ernest H. Devlin, Robert Houston, Thomas Bullen, Joseph Lavin, Alex. McLachlan, Henry Mitchell, John Newman, John Bennett, Matthew Meek, Albert Radford, and Owen Dabb, Firebosses.

This mine is situated at Cassidy and is opened up in the Douglas seam, which averages 10 feet in thickness. It was acquired mainly to secure a supply of coke for the company's smelter at Anyox.

Operations at this mine were continuous throughout the year. This was due largely to the fact that steady operation of the Anyox smelter called for a regular supply of slack coal.

Improvements underground were confined chiefly to the excavation of a large sump and the installation of a Gould's triplex pump with a capacity of 300 gallons a minute when working at a head of 700 feet a minute. Air-driven pumps on lower levels pump into this central sump.

On the surface the chief improvements were in the washery. A 75-foot Dorr thickener was added to the equipment and a Smith-Vaile triplex pump with a capacity of 450 gallons a minute was installed in order to pump the clarified water from the thickener to the washery. The power-plant capacity was increased by the addition of a 360-horse-power Babcock & Wilcox boiler. An electric locomotive and six automatic side-dumping cars of the Granby type have been added to the surface equipment. This installation will handle all waste rock from the mine.

(For description of townsite, rooming-house, change-house, mine buildings, tipple and washery, and power-house equipment *see* Minister of Mines' Report for 1919.)

Underground development has been pushed ahead during the year, slopes have been driven off Nos. 5 North and South levels a distance of 800 feet, making the distance from the surface some 4,000 feet; Nos. 6 North and South levels have been turned off these slopes and are in good coal, but very friable.

The seam continues irregular in thickness, subject to rolls in the roof and floor, and a number of silted areas have been encountered.

A large number of outbursts of gas and coal have occurred in this mine during the year. The first one occurred on January 14th, 1921.

The coal displaced sometimes reaches as high as from 150 to 400 tons. The displacement of coal is not violent as a rule, simply moving the face forward 10 or 15 feet. Timbers are sometimes displaced owing to the outbursts coming more from the rib than the face and pushing the legs from under the stringers.

These outbursts give quite a little warning in the shape of cracking and "bumping" at the face before an outburst takes place. By a system of signalling and telephones in each district, and the firebosses having a small compact district due to the panel system of working, all workmen on the return side of a blow-out are warned and retire to fresh air, which is made easy by the number of splits in the air-current.

Sometimes the coal is powdered from the outburst, and as it has not been violently displaced, it would seem that the coal is already powdered before the outburst occurs; i.e., that it is in a

finely powdered state in the pocket in which the gas has been occluded. An analysis of this dust collected after an outburst showed an ash content of 40 per cent. All these outbursts have occurred below the Nos. 4 North and South levels.

All blasting is prohibited below Nos. 4 North and South levels, except where brushing either in the roof or floor is to be done, and then only under certain conditions.

There is a great deal of credit due the mine manager and his official staff for the way they have handled the large number of outbursts in this mine during the year, without any accidents occurring.

In my last inspection of Granby No. 1 mine I measured 120,000 cubic feet of air a minute passing into the mine, divided into four splits.

In No. 1 North split there was 10,000 cubic feet of air a minute passing for the use of ten men.

In No. 2 North split there was 24,000 cubic feet of air a minute passing for the use of thirty men.

In No. 3 North split there was 26,000 cubic feet of air a minute passing for the use of thirty-seven men.

In the South side split there was 22,680 cubic feet of air a minute passing for the use of thirty men.

I found a small quantity of explosive gas in the following places: In No. 1 room off No. 2 incline, and in a crosscut off No. 3 incline, No. 4 North level, and a ⅛-inch gas-cap travelling in the air on the return side of No. 1 slope, No. 5 North level; this gas cap was due to a slight outburst of gas in this section on the day previous; also a little in Nos. 5 and 6 rooms off No. 1 slope, No. 5 South level.

Tests made with the Burrell gas-detector in this mine were as follows: Return from No. 1 North split showing 0.4 per cent. methane in 10,000 cubic feet of air a minute; return from No. 2 North split showing 0.6 per cent. methane in 26,000 cubic feet of air a minute; return from No. 3 North split showing 1 per cent. methane in 30,000 cubic feet of air a minute; South side split showing 0.7 per cent. methane in 30,000 cubic feet of air a minute; Main return showing 0.9 per cent. methane in 140,000 cubic feet of air a minute.

I regret to say that there were three fatal accidents in Granby No. 1 mine during the year—two due to falls of rock in the face and one on the haulage.

The following are the official returns for the Granby Colliery for the year ending December 31st, 1921:—

Name of seams of pits—Granby Colliery No. 1, Douglas seam.

Description of seams, tunnels, levels, shafts, etc., and number of same—Douglas seam. Average dip, 20°. Seam irregular in thickness, varying from 0 to 25 feet sometimes in remarkably short distances. Seam subject to rolls, pinched and silted areas. The mine is being operated with the idea of extracting largest possible percentage of coal at minimum cost. Large and substantial pillars have been left along all main haulage-roads and permanent airways. The Main slope has been driven approximately 4,500 feet from the surface, is exceptionally well timbered, and has been driven wide enough for two tracks. Six levels have been turned to north and south off Main slope. Practically all coal extracted to date has come from development places.

Description and length of tramway, plant, etc.—Plant modern in every way. Sirocco fan, capacity 150,000 cubic feet a minute; Vulcan hoist, 18 by 36 inches, double-drum second-motion. Tipple equipped with rotary dump, Marcus screen, loading-booms, railway-cars handled with Fairmont car-retarders; washery equipped with 2-compartment jigs, capacity 80 tons an hour, seven Deister-Overstrom tables, and 75-foot Dorr thickener. Edison storage-battery electric locomotives used for underground haulage in part of mine. Boiler plant equipped with two Badenhausen boilers fired by type E mechanical stokers and one B. & W. boiler fired with Sanford-Riley mechanical stokers. Ashes flumed to dump.

THE ADIT MINE (OLD WELLINGTON COLLIERY).

These mines are operated by King & Foster, No. 1 mine being the Old Adit mine formerly operated by R. Dunsmuir & Sons and is the original Wellington seam. During the past year the coal mined in this area was taken from the outcrop lying to the west and south-east of the old adit level, and also from a few pillars. About 600 feet to the north of the portal of the old level an open-cut in soft coal has been made, but up to the present time the coal has not been of sufficient hardness to ship.

No. 2 mine, the entrance of which lies about 2,000 feet to the north of the No. 1 mine, was opened up in the early part of the year; it is in the upper seam and lies approximately 40 feet

above the Wellington seam. This mine was first opened by the late R. Dunsmuir about the year 1868, but was not worked extensively as the coal is thin; the original slope and Main level were driven very narrow, being only about 5 feet wide; the old wooden rails were found in places. At the present time the mine is worked on the long-wall system; owing to the variable thickness of the seam and the amount of dirt that has to be handled, considerable difficulty is met with in working the seam.

During the year a pit-head has been built at No. 2 mine; also a spur track on the Esquimalt & Nanaimo Railway, 1 mile from No. 2 mine, has been constructed, with a pair of loading-chutes and the necessary approach.

I inspected all accessible parts of Nos. 1 and 2 mines of this colliery in December and found timbering and roadways in good condition. No explosive gas found in the mines, which were entirely free from coal-dust.

Henry Shepherd is fireboss in No. 1 mine, where there are four men employed, and Clifford Dickenson is overman in No. 2 mine, where there are eight men employed.

The following returns show the output of the firm's mine for the year 1921:—

Sales and Output for Year. (Tons of 2,240 lb.)	Coal. Tons.	Tons.
Sold for consumption in Canada	4,101

Dredging operation on reclamation of slack coal only.

Names of seams or pits—Douglas seam.

Description of seams, tunnels, levels, shafts, etc., and number of same—The seam is reached by means of shafts. No. 3 shaft, which is used for hoisting, is 655 feet in depth, 10 by 16 feet in the clear; No. 4 shaft, which is used for ventilation, is 630 feet in depth, 10 by 12 feet in the clear; this air-shaft is equipped with steam-hoist and cage as the emergency outlet. the mine is opened out by slopes and levels; a pair of slopes are driven from the shaft-bottom in a north-easterly direction for approximately 2,500 feet; they are 12 feet wide. Another pair of slopes are driven in a south-easterly direction for approximately 1,600 feet; they are also 12 feet wide. Levels are driven right and left from these levels.

Description and length of tramway, plant, etc.—At this mine the plant consists of three 150-horse-power and one 100-horse-power boilers, return-tubular type; one pair of 24- by 36-inch hoisting-engines with safety overwinding device, with steam-reverse and steam-brake; two 10-foot sheaves and self-dumping cages are installed at the hoisting-shaft, and one pair of 16- by 24-inch hoisting-engines, cages, and fixtures complete at the air-shaft. In the power-house there are: One Canadian Rand cross-compound air-compressor, capacity 2,100 feet of free air a minute; one Norwalk straight-line compound air-compressor, capacity 707 feet a minute; one single straight-line Canadian Rand air-compressor, capacity 505 feet a minute; two 150-kw. electrical generators connected with 13 by 20 by 9 high-speed engines; one Sheldon ventilating mine-fan, belt-driven by a 17-20 steam-engine; a 60-horse-power electric motor is installed alongside for an emergency drive. There is a thoroughly equipped machine-shop, blacksmith-shop, and carpenter-shop, also mine-rescue station containing two sets of Gibbs rescue apparatus complete and pulmotor. In the tipple building there are two sets of Marcus screens, picking tables, etc.; the machinery being all electrically driven. A standard-gauge railway 7½ miles long, equipped with locomotives and fifty coal-cars, is used for handling coal from mine to tide-water at Boat harbour, the shipping-point, which is equipped with wharves, bunkers, washery, etc., to take care of the largest ocean-going vessels.

Canadian Collieries (Dunsmuir), Ltd.

Head Office—Montreal, Que.

Capital, $15,000,000.

Officers.	*Address.*
F. Perry, President,	Montreal, Que.
H. B. Walker, Vice-President,	Montreal, Que.

WELLINGTON-EXTENSION COLLIERY.

Thomas A. Spruston, Superintendent; James Strang, Manager, Nos. 1, 2, and 3 Mines.

This colliery is operated by the Canadian Collieries (Dunsmuir), Limited, and is composed of Nos. 1, 2, and 3 mines at Extension and No. 5 mine at South Wellington, all situated in the Cranberry district, and is connected to Ladysmith, Oyster harbour, by a railway 11 miles in extent, over which the entire output from the mines are hauled and shipped.

All the mines have worked steadily throughout the year, the coal being a very high grade of domestic fuel, being in great demand in and around the Coast cities.

The Nos. 1, 2, and 3 mines are opened up in the Wellington seam, which varies in thickness from 2 to 6 feet.

Portions of the seam are very much broken up by "folds" and "overlaps." The three mines, which were originally opened up on the outcrop of the seam, are now connected by a tunnel driven 14 by 7 in the clear on a 1-per-cent. grade and a little over a mile in length. Electric-motor haulage is maintained along the tunnel and continued into No. 2 mine a distance of 1¼ miles and half a mile in No. 3 mine. The type of electric locomotive used is the 13-ton Baldwin-Westinghouse.

(For description of power-house equipment and surface plant, tipple arrangements, wash-house, and mine-rescue station *see* Minister of Mines' Report for 1920.)

LADYSMITH.

The shipping-point for the output of this colliery is at Ladysmith, where the coal is either shipped by vessel or railway-cars by means of a transfer-barge to Mainland points. The coal-washery is also situated at this point, and consists of three washers of the following dimensions: Nos. 1 and 2, diameter 8 feet 9 inches, depth 5 feet 6 inches; No. 3, diameter 8 feet 3 inches, depth 5 feet 9 inches; computed capacity of each washer, 300 tons for twelve hours. Six compartment jigs are situated on the lower floor. Three Masco tables, 14 by 7 feet, take care of the fine coal, which produces a high-grade coal for coking purposes and foundry use. Power for the washery is supplied by a Pelton wheel which is operated from the mountain source.

A 40-kw. 240-volt Allis-Chalmers-Bullock generator supplies power to operate the Masco tables, which are driven by a 25-horse-power General Electric type H motor, and also supplies light for all purposes on the shipping-wharf, transfer-wharf, and around the plant.

There has been considerable interest taken in first-aid work at this colliery during the year; thirty-seven men have passed an examination in first-aid training and a number of them have taken training in mine-rescue work.

NO. 1 OR TUNNEL MINE, EXTENSION.

James Strang, Manager, Nos. 1, 2, and 3. Mines; William Wilson, Overman; James Glen, John Greenhorn, Walter Joyce, Thomas Wilson, William Clifford, David J. Gordon, and John Mawson, Firebosses.

This mine is the first intersected on the Main tunnel and is operating in what is known as the "Underlap" portion of the Wellington seam, which continues irregular in thickness and is subject to "steps" and "rolls" in the roof and floor of the seam, meeting with silted areas in the development of the same.

The method of mining is the long-wall system; owing to the broken and dislocated condition of the field, hand-mining is employed. During the year operations have been carried on in the No. 3 slope, in the various levels to the east and west, while the slope and counter-slope have been driven to within a workable area of the Main overlapping fault.

The Old No. 6 East section off the Main slope, which was abandoned some years ago on account of meeting with barren ground, has been opened up and driven a distance of 700 feet, passing through the barren ground into a showing of good coal, although somewhat thin. An incline has been driven up a distance of 400 feet off this level in fairly good coal.

The old Tunnel siding incline has been cleaned up and retimbered and developments commenced on the pillar-and-stall system in an area of good hard coal, averaging about 5 feet thick.

The haulage equipment consists of a 100-horse-power Ottumwa electric hoist situated at the top of the Main slope. The lower development of the No. 3 slope haulage is maintained by a 50-horse-power Ottumwa hoist driven by a Westinghouse motor.

The Edison storage-battery electric safety-lamps are in use throughout the mine. Only the firebosses use safety-lamps of the Wolf type for testing purposes. All blasting is done with permitted explosives fired by electric battery.

This mine is ventilated by a Murphy-type exhaust-fan with a capacity of 40,000 cubic feet of air a minute, against a 1.9-inch water-gauge, driven by an Allis-Chalmers-Bullock motor.

When I made my last inspection of this mine I measured 22,200 cubic feet of air a minute passing into the mine for the use of fifty-six men and five mules.

I found a small quantity of explosive gas in face of the West level skip. Timbering and roadways were in good condition and the mine entirely free from coal-dust.

Test made with the Burrell gas-detector in the return-airway showed 0.4 per cent. methane in 28,450 cubic feet of air a minute.

No. 2 Mine, Extension.

Robert L. Spruston, Overman; Joseph Watson, Robert N. Hamilton, William Cosier, Edward Heyes, William Simpson, William Bauld, John Davidson, and William Gilchrist, Firebosses.

This mine is divided into two districts—namely, No. 4 East district and the West Incline district. No. 4 East district turns off the Main tunnel at a distance of 1 mile from the entrance to the mine and is in a distance of 1¼ miles. It has been in continuous operation during the year, with the exception of the usual holidays and the Saturday afternoon shift; the miners not turning out in sufficient numbers to warrant the operation on these occasions. The method of mining is part long-wall and part pillar and stall, as the conditions and thickness of the seam permit.

The whole of the operations on the East side is concentrated on the rise side of the level and is divided into four inclines, three of which are operated by gravity. The East incline and No. 1 are worked on the pillar-and-stall method, while a portion of No. 2 incline is worked pillar and stall and a portion worked long-wall. No. 17 incline is worked exclusively on the long-wall system, the seam being very thin and undulating. The coal is gathered from all these inclines by a Baldwin-Westinghouse locomotive.

The West incline begins at a point about 500 feet to the west of the Main tunnel and parallels the old outcrop slope a distance of 2,000 feet, where the ventilating-fan is located.

Pillar-and-stall work and pillar-extraction have been the principal operations in this part of the mine during the year.

This mine, like No. 1, is equipped with the Edison storage-battery electric safety-lamps, safety-lamps of the Wolf type being used only by the firebosses for testing purposes. All blasting is done with permitted explosives fired by electric battery.

The pumping equipment of this mine consists of a 5-stage Mather & Platt turbine-pump, 375-gallons-a-minute capacity at a 250-foot head, running 1,400 r.p.m., driven by a 75-horse-power D.S.C. General Electric motor, and a 3-stage Mather & Platt pump, 275-gallons-a-minute capacity at 225-foot head, running 1,400 r.p.m.

The mine is ventilated by a Murphy fan of 40,000 cubic feet capacity, against a 1.9-inch water-gauge, and is driven by a 25-horse-power type D.L.C. General Electric motor.

When I made my last inspection of No. 2 mine I measured 33,000 cubic feet of air a minute passing into the mine, divided into three splits.

In No. 1 East split there was 15,000 cubic feet of air a minute passing for the use of forty-six men and seven mules.

In No. 2 East split there was 8,000 cubic feet of air a minute passing for the use of twenty-two men and five mules.

In the West side split there was 10,000 cubic feet of air a minute passing for the use of twenty-two men and three mules.

No explosive gas found in this mine. Timbering and roadways were in good condition and the mine fairly free from coal-dust.

Tests made with the Burrell gas-detector in this mine were as follows: No. 1 East split showing 0.2 per cent. methane in 16,300 cubic feet of air a minute; No. 2 East split showing 0.1 per cent. methane in 8,850 cubic feet of air a minute; West side split showing 0.3 per cent. methane in 11,300 cubic feet of air a minute; Main return airway showing 0.3 per cent. methane in 39,400 cubic feet of air a minute.

No. 3 Mine, Extension.

Thomas Strang, Overman; James P. Nimmo, Jr., David Davidson, George Smith, Daniel Campbell, and Patrick Malone, Firebosses.

This mine is reached from the end of the Main tunnel, the main haulage-road following the strike of the seam for a distance of 2,000 feet, where the slope connects with Malone's Dip section, McCoy's incline, and the Heading district; and an incline connecting the No. 4 West level and inclines to the rise side of the same. The whole operation in No. 3 mine is pillar-extraction.

The haulage equipment consists of a 50-horse-power Ottumwa electric hoist, driven by a 50-horse-power General Electric motor. The Main level haulage is operated by a Baldwin-

Westinghouse locomotive. The mine is ventilated by a Guibal exhaust-fan with a capacity of 60,000 cubic feet of air a minute, against a 1.7-inch water-gauge. This mine is also equipped with the Edison storage-battery head-lamp, with the exception of the firebosses. All blasting is done with permitted explosives fired by electric battery.

On my last inspection of this mine I measured 22,000 cubic feet of air a minute passing into the mine, divided into two splits.

In No. 1 split there was 12,000 cubic feet of air a minute passing for the use of thirty men and seven mules.

In No. 2 split there was 9,000 cubic feet of air a minute passing for the use of twenty men and five mules.

No explosive gas found in this mine. Timbering and roadways were in good condition and the mine fairly free from coal-dust.

Tests made with the Burrell gas-detector were as follows: No. 1 split showing 0.3 per cent. methane in 13,500 cubic feet of air a minute; No. 2 split showing 0.2 per cent. methane in 10,000 cubic feet of air a minute; Main return showing 0.4 per cent. methane in 29,000 cubic feet of air a minute.

The following are the official returns from the Wellington-Extension Colliery for the year ending December 31st, 1921:—

Name of seams or pits—Wellington Extension.
Description of seams, tunnels, levels, shafts, etc., and number of same—Nos. 1, 2, and 3 mines connected by Main tunnel.

No. 5 MINE, SOUTH WELLINGTON.

Thomas A. Spruston, Manager; David Martin, Overman; Joseph Lane, James E. Parrott, James McLachlan, Adam Watson, Thomas Robson, Neil McIntyre, Robert Ewing, and William Brown, Firebosses.

This mine is situated at South Wellington, about 5 miles south of Nanaimo, alongside of the Esquimalt & Nanaimo Railway. It is operating in the Douglas seam, adjacent to the Old Alexandria mine. The coal is shipped to Ladysmith and Mainland points over the Esquimalt & Nanaimo Railway, a small spur connecting the mine operation with the main line. The mine is entered by means of a slope at the outcrop.

The Main slope is driven down a distance of 3,000 feet and is 14 by 8 in the clear, and timbered with square 12 by 12 sets, 2-foot centres, from the slope entrance for a distance of 200 feet, and from this point with round sets, 4-foot centres; the upper portion of the slope is whitewashed and electric lights strung practically all the way.

During the year no development was done on the Main slope, the last 500 feet of which was barren ground. It was found when driving the face of the slope that the roof and floor met, thereby cutting or pinching the coal out entirely. Boreholes were put in the roof and floor at various points with a small diamond-drill, without any success.

The present operations of this mine consist of No. 3 North levels which are driven to the boundary, where a Diagonal slope is turned off and driven down a distance of 2,000 feet, and, like the Main slope, this slope was driven through barren ground for a distance of 600 feet, when 7 feet of high-grade coal was struck. At the present time there are three levels in operation on the North side of the slope and four levels on the South side. The coal varies in thickness in these levels from 2 to 8 feet and is worked on the pillar-and-stall system.

The No. 6 South levels off the Main slope are in a distance of 2,803 feet in barren ground composed of blue shales. Boreholes have been put in the roof a distance of 82 feet and in the floor 100 feet, without any results.

A borehole from the surface down and a distance of 1,000 feet from the face of the levels records a showing of 11 feet of hard coal. A Diagonal slope is turned off this level at a point 700 feet from the Main slope and is down a distance of 2,000 feet in coal; levels are operating to the north and south off this slope in fluctuating ground, the coal varying in thickness from 2 to 6 feet.

The haulage equipment consists of a steam-driven hoist, 18 by 36, situated on the surface to operate the Main slope. A 100-horse-power Ottumwa electric hoist, driven by a M.S.D. General Electric motor, hauls the output from the North Diagonal slope. The South Diagonal slope is operated by a 50-horse-power compressed-air-driven hoist.

The ventilation is produced in this mine by an 8-foot Stine fan, belt-driven by a 50-horse-power type 3 Westinghouse motor, with a capacity of 80,000 cubic feet of air a minute, against a 1.5-inch water-gauge. This mine is equipped with the Edison storage-battery electric safety-lamp, the Wolf type being only used for testing purposes by the firebosses. All blasting is done with permitted explosives fired by electric battery.

(For description of power-house equipment, plant, and buildings *see* Minister of Mines' Report for 1920.)

On my last inspection of this mine I measured 40,000 cubic feet of air a minute passing into the mine, divided into two splits.

In the South side split there was 18,000 cubic feet of air a minute passing for the use of forty men.

In the North side split there was 20,000 cubic feet of air a minute passing for the use of sixty men and seven mules.

I found a small quantity of explosive gas in face of No. 1 Right counter-level off No. 6 South slope. Timbering and roadways were in good condition and the mine free from coal-dust.

Tests made with the Burrell gas-detector in this mine were as follows: North side split showing 0.4 per cent. methane in 22,000 cubic feet of air a minute; South side split showing 0.3 per cent. methane in 20,000 cubic feet of air a minute; Main return airway showing 0.4 per cent. methane in 45,000 cubic feet of air a minute.

The following are the official returns from the No. 5 South Wellington Colliery for the year ending December 31st, 1921:—

COMOX COLLIERIES.

Report by Thos. R. Jackson, Inspector.

Charles Graham, District Superintendent.

These mines are situated in the Comox district, about 17 miles from Union Bay. A railway about 20 miles in length connects the various mines to a shipping-point at Union Bay, over which the whole output of coal is conveyed. The mines in operation are Nos. 4 and 5, No. 7 mine being permanently abandoned in month of September. Nos. 6 and 8 are not operating. No. 4 mine is located at the east end of Comox lake and is about 3 miles distant from the city

of Cumberland. No. 5 is situated about a mile from the city. No. 7 is located at the town of Bevan, nearly 6 miles in a northerly direction from the city of Cumberland. No. 6 mine is close to the city. No. 8 mine is about 2 miles north of Bevan.

There was no special development of note in the underground operations during the year. On the surface extensive repairs were carried out on the flume of the hydro-electric plant. The large area covered by the underground operations at No. 4 mine, Comox, has for some time been taxing the ventilation facilities at that mine. In October of the present year operations were started to install a second fan; with the new installation completed, the Nos. 1 and 2 slopes of this mine will be ventilated, each by a separate unit.

The present unit consists of a Sullivan reversible double-inlet fan having a capacity of 180,000 cubic feet a minute, against a 6-inch water-gauge. The fan is electrically driven by a 350-horse-power induction-motor, 2,200 volts, speed 250 r.p.m., and is directly connected to the fan-shaft. This fan will in future ventilate the workings of No. 2 slope, whilst the new installation will take care of the workings of No. 1 slope. The new unit is situated just west of the travelling-way, and in order to make room for the installation extensive changes were made in the railway-yard, which not only increased the capacity, but added much to the efficiency and appearance of the whole plant.

The new plant consists of a 108-inch double-inlet reversible Sirocco fan on concrete base, with half-housing in steel. The fan will be connected to the mine by a reinforced-concrete tunnel fully equipped with explosion-doors. The fan will run at 250 r.p.m. and will deliver 200,000 cubic feet of air a minute, against a 6-inch water-gauge. The primary power unit will be a 500-horse-power synchronous motor, 2,200 volts, equipped with a self-starting unit. The motor will run at 500 r.p.m., connected to the main shaft of the fan through a jack-shaft with silent chain drive in two sections, each 15 inches wide; the ratio between the motor and fan-speed being 2 to 1; the distance between centres of drives will be 106 inches.

In addition to the primary drive there will be carried as an emergency unit a 350-horse-power induction-motor, speed 250 r.p.m., which can be connected by a coupling direct to the main fan-shaft. This induction-motor is a duplicate of the motor now in use on the present ventilation units at No. 4 mine and also at Nos. 5 and 6 mines, and can in emergencies be used on any one of the three units. The power unit will be housed in a fire-proof concrete building with asbestos roofing, and in all makes one of the most complete and efficient ventilating plants in the Province.

Diamond-drilling.

During the year diamond-drilling was continuously prosecuted in the Tsable and Cumberland fields; much of the time three drills were in operation; one was withdrawn in October and transferred to the Ladysmith district.

In the Tsable River district, to the 115,220 feet of roads made to facilitate movement of drills and 15,051 feet of holes drilled during 1919 and 1920, there was added in 1921 12,900 feet of roads and 6,991.6 feet of drilling; all of this drilling gave a 2-inch core. In the Cumberland district 12,300 feet of roads were made to facilitate movement of the drills and 3,370 feet of holes drilled. This makes a total for the year in the Comox field of 25,200 feet of roads made and 10,361 feet of holes drilled.

The hydro-electric plant has been in constant operation throughout the year. The power-house has been operated satisfactorily and no repairs or improvements were required. Sufficient electricity is generated at this plant to supply motive power to all the collieries; also the wharf at Union Bay, including the lighting of this town, Courtenay, and the city of Cumberland.

First-aid and Mine-rescue Work.

I have much pleasure in reporting that active interest in first-aid and mine-rescue work continues in the district of Cumberland, a few more men having acquired the St. John Ambulance certificate. In the first-aid competition held under the auspices of St. John Ambulance Association, and open to the whole of Canada, Cumberland Colliery employees entered two teams in the contest, the result of which will not be known until some time in the beginning of the new year.

The sixth annual field-day of Vancouver Island Mine Safety Association was held on Labour Day on the athletic grounds, Cumberland. In the first-aid events Cumberland won three firsts

and a second, securing both first and second prizes in the British Columbia Department of Mines cup; also winning first in the 3-man and first in the 2-man contests.

The first prize, Department of Mines cup and gold medals, was won by No. 4 underground team of Cumberland, comprised as follows: Wm. Beveridge (captain), Jonathan Taylor, Robert Reid, Louis Francescini, and John Williams.

In the mine-rescue competition, six teams competing—namely, Nanaimo (3), Cumberland, Granby, and Ladysmith—Cumberland team carried away first prize with a perfect score of 500 points, winning the V.I.M.S.A. Shield and six Elgin watches. The team comprised Wm. Gillis (captain), Louis Francescini, Jonathan Taylor, Wm. Evans, and Arthur Watson.

Cumberland Station now consists of ten sets of approved type of Paul apparatus, the Draeger apparatus being entirely discarded. John Thomson is the supervising officer in charge of the station and does all in his power to advance the work, in addition to instructing the men in the mechanism of the machine and also lecturing to them on the subject. The machines and accessory outfit are given the best of care by the instructor. The rescue-station has always been ready to meet emergency calls, but no demands were made during the year.

Ten lessons of two hours' duration each constitute a complete course, performed in a training-gallery filled with irrespirable fumes; other conditions are made much similar in character to that in which a mine would be after a fire or explosion. The training is hard work; therefore much credit is due the men who voluntarily carry on this work.

It is rather regrettable to think that no candidates entered for a course of above work at the station this year. Different reasons might be given to answer why this is so, but the main reason is, I think, due to the laborious nature of work the candidate has to perform, which makes the course anything but popular.

At Cumberland a mine-rescue team has been practising once a week during the year, for which the company remunerates them with $2.50 each per practice. They are expected to put in four practices a month.

Safety-first Work.

George O'Brien continues to act as safety-first engineer for the company, visiting once a month all the collieries, surface and underground, and the wharves connected with these collieries in Comox and Extension districts.

It is gratifying to know that through the forces at work in this direction the results obtained are very commendable and warrants a continuation of safety-first methods for the prevention of accidents around mines.

Coal-mine regulation notices are in evidence, and safety-first notices in large letters are posted up in conspicuous places at the different collieries, printed in four languages, warning the workmen to strictly observe the rules laid down for their guidance.

At the entrance to No. 4 mine an electric safety-bell is set and so arranged that the trip of cars coming out or going in the mine causes a bell to ring, thereby warning the passer-by of approaching danger.

Inspection on Behalf of Workmen.

According to section 91, Rule 37, of the "Coal-mines Regulation Act," the workmen are entitled to appoint one or two of their number to make an inspection of all the mine once a month. This has been done regularly and no adverse report was received at this office during the year.

The company introduced an "efficiency committee" to inspect the mines as well. It consists of two miners taken from the mine employees, their wages being paid by the company.

No. 4 Mine, Comox.

William Walker, Manager; John S. Williams, Overman, No. 1 Slope; Charles Parnham, Overman, No. 2 Slope; Charles O'Brien and Norman Huby, Shiftbosses; Sam Horwood, J. Bennie, Nathaniel Bevis, Richard Hodson, Alfred Jones, Peter Myers, William Beveridge, John C. Brown, A. W. Watson, R. Barker, William Herd, Watkin Williams, Robert Reid, Thomas Lewis, D. P. Marsh, F. Hutchison, W. Whitehouse, J. Dando, Thomas Cunliffe, J. Taylor, and H. King, Firebosses.

This mine consists of two slopes with but one main entrance. There is also a manway, No. 1 slope is 7,000 feet in length, running due north. No. 2 slope is 9,000 feet long and runs

N. 45° E. These slopes diverge at a point about 75 feet from the main portal. The electric haulage-engine is so connected that trips can be run simultaneously on both slopes to a point where they converge to the main opening.

The men are conveyed from the bottom of these slopes in a man-trip at the end of each working-shift. A safety-car is connected to the rear car of the empty trip, which ensures the workmen's safety while riding up the slope.

The ventilation of this mine is produced by a Sullivan reversible fan, motor-driven, 350 horse-power, direct-coupled, running at 245 r.p.m., and capable of delivering 196,000 cubic feet of air a minute, against a water-gauge of 6 inches.

This mine has been in continuous operation during the year. Safety-lamps of the Wolf type are used by the firebosses; electric lamps of the Edison storage-battery type are used by all other employees. Where blasting is done only permitted explosives are used and these are fired by electric battery.

No. 1 Slope.

Electricity is used as the motive power to operate all pumps, winches, and coal-cutting machines. West side of No. 4 slope has a long-wall system of mining coal. Undercutting is done by a Sullivan type of coal-cutting machine. Miners digging coal by the long-wall system also work in this section. Loaders are employed to load out the machine-mined coal. Certificated miners supervise the timbering and general safety of the loaders. Pillars are also extracted from the upper side of East side section of No. 4 slope. A Sullivan coal-cutter does the undermining in some of the stalls in East side section. Seam varies from 3 to 7 feet in thickness.

Haulage from the faces is done by drivers with mules to No. 4 slope. A winch situated at top of this slope, on No. 15 West level, attends to delivery of cars. A 5½-ton Ironton storage-battery locomotive is used for hauling on above level to the bottom of Main slope, the source of supply. A recharging apparatus has been installed in above level, so that when necessary the motor can be run into the station and recharged.

During my last inspection in December I measured 32,480 cubic feet of air a minute passing into this part of the mine, divided into two splits.

In No. 1 split there was 13,000 cubic feet of air a minute passing for the use of sixty-three men and seven mules. Got a ⅜-inch gas-cap in No. 1 left place, No. 4 slant, off No. 3 West level, and a ¼-inch gas-cap in long-wall places off No. 1 West level. Section fairly free from coal-dust and general conditions fair.

In No. 2 split there was 13,000 cubic feet of air a minute passing for the use of sixty-two men and seven mules. Got a trace of gas in air off No. 20 East level pillars and a ¼-inch gas-cap in pillars off No. 2 slant, No. 1 East level. Section fairly free from coal-dust and general conditions fairly good.

No. 2 Slope.

The long-wall system of mining coal is in practice in New slope off No. 20 East level. In part of the section miners dig the coal; in the other part it is machine-mined. Extraction of pillars is conducted in the remainder of the mine, with the exception of No. 15 East level slope, the workings of which are now fairly extensive in the pillar-and-stall system.

The haulage system is much similar to that which obtains in No. 1 slope, except the motor.

During my last visit of inspection of this mine I measured 25,200 cubic feet of air a minute passing down slope at a point near No. 18 East level.

In No. 1 split there was 8,820 cubic feet of air a minute passing for the use of twenty-five men and three mules.

In No. 2 split there was 18,000 cubic feet of air a minute passing for the use of sixty-three men and eight mules. I found the ventilation and timbering fair and sections of mine fairly free from coal-dust. Got a slight gas-cap in Evans and Main slope places off No. 15 East level slope. Gas-cap of varying size in air of Nos. 16, 17, and 18 level places. No. 20 East level fenced off at door; also No. 1 level off No. 20 East slope. Got a quantity of gas at heading-face off No. 20 West level.

Owing to roof-break of six places of long-wall section off No. 20 East slope, a considerable quantity of gas was liberated, requiring No. 1 level off the slope and No. 20 East level to be fenced off.

Burrell gas-detector tests made by me in the various return airways gave the following results:—No. 1 slope: Main return, volume of air 44,600 cubic feet, 0.6 per cent. methane; No. 1 split, volume of air 23,040 cubic feet, 0.7 per cent. methane; No. 2 split, volume of air 8,000 cubic feet, 1.5 per cent methane. No. 2 slope: Main return, volume of air 56,000 cubic feet, 0.8 per cent. methane; No. 1 split, volume of air 8,820 cubic feet, 0.4 per cent. methane; No. 2 split, volume of air 35,000 cubic feet, 1.5 per cent. methane.

No. 5 Mine, Comox.

John G. Quinn, Manager; Robert Brown, Overman; Frank Crawford and Sam Jones, Shift-bosses; Duncan Thomson, Thomas Eccleston, William Devoy, Thomas Shields, John E. Spicer, William Harmison, James Monks, William J. Keenan, James Brown, Jasper Rutherford, Thomas Wilson, and A. Darbyshire, Firebosses.

The workings of this mine are reached by a shaft 280 feet deep. Electricity is used for hoisting, winch-driving pumps, coal-cutting machines, and operating Main level 6-ton motor, trolly-connected. At the bottom of No. 2 Dip slope a 5½-ton motor (Ironton) attends to the haulage on level 1,600 feet in length; the motor consists of storage-battery equipment. A recharging-station has been fitted up on the level. All the workings at present are in the Upper seam. Long-wall and pillar-and-stall systems are employed. Sullivan type of coal-cutters are principally used in stalls. Depth of undercut, 6 feet; height of seam varies from 2 feet 6 inches to 7 feet. Inclination of seam varies from horizontal to 6°. Coal-loading from the machine-cut face is done by loaders supervised by certificated miners.

In the long-wall coal getting and loading is done by certificated miners and helpers. No blasting is done without the use of cable and electric battery. Only permitted explosives are used. Electric lamps of the Edison type are used by the workmen, excepting firebosses, who use the Wolf type of safety-lamp. Part of the output is produced by extraction of pillars.

During my inspection in the month of December I measured 35,000 cubic feet of air a minute passing through the tunnel, divided into two splits.

East Split.—There was 13,000 cubic feet of air a minute passing for the use of forty men and six mules.

West Split.—There was 13,500 cubic feet of air a minute passing for the use of forty-two men and seven mules.

No. 2 Dip Section.—There was 16,500 cubic feet of air a minute passing for the use of thirty-five men and four mules. General conditions of mine good. Got a little gas at face of No. 4 West counter-level. Mine free from coal-dust.

The following represents the quantities of air passing in the different airways of No. 5 mine, also the percentages of methane in air obtained with Burrell gas-detector: East split, in 13,250 cubic feet of air a minute passing there was 0.2 per cent. methane; West split, in 8,320 cubic feet of air a minute passing there was 0.3 per cent. methane. Main return at fan, quantity of air passing a minute was 156,000 cubic feet; no methane.

No. 6 Mine, Comox.

John G. Quinn, Manager; Thomas Mordy, Overman.

There has been no coal hoisted from this mine during the year. Practically all the water made in Nos. 5 and 6 mines is hoisted from No. 6 shaft by specially constructed tanks capable of delivering 1,200 gallons of water a minute.

During my inspection in December I measured: East split, 12,000 cubic feet of air a minute passing; West split, 10,500 cubic feet of air a minute passing. Found no gas and general conditions of mine fair.

The following are the official returns for the year ending December 31st, 1921, of the aggregate output of all the Comox Collieries:—

SALES AND OUTPUT FOR YEAR.	COAL.		COKE.	
Tons of 2,240 lb.	Tons.	Tons.	Tons.	Tons
Sold for consumption in Canada	338,798			
" export to United States	20,191

COMOX INSPECTION DISTRICT.

REPORT BY THOMAS R. JACKSON, INSPECTOR.

I have the honour to submit herewith my annual report of the various coal-mines in my inspectorate for the year ending December 31st, 1921. They consist of the Western Fuel Corporation of Canada's No. 1 and Protection shafts, Nanaimo; the Canadian Collieries (Dunsmuir), Limited, Cumberland, Comox mines Nos. 4, 5, 6, and 7; and the Pacific Coast Coal Mines, Limited, Victoria, Suquash Colliery, Suquash, near Alert Bay, Vancouver island. A short description is given of each colliery, with the names of the certificated officials.

FIRST-AID AND MINE-RESCUE WORK.

I have much pleasure in being able to report splendid progress in first-aid work. Results indicate a lessening of accidents, which must be attributed to the forces at work tending to eliminate carelessness, negligence, want of thought, and lack of appreciation of danger, due to acts and defaults of the individual. With proper instruction and education leading to observe proper precautions against accidents, a greater reduction can confidently be expected. The Western Fuel Corporation passed the year without having a fatal accident in its mines. This record was attained something like twenty years ago.

Its employees entered four teams in the All-Canada first-aid competition held under the auspices of the St. John Ambulance Association. Dr. Hodgetts, of Ottawa, was the examiner. They competed for the Montizambert, Coderre, and Wallace Nesbitt trophies. The senior results will not be known until about the end of January or during February. In the juvenile competition Nanaimo's junior team won second prize in the Wallace Nesbitt trophy. Team: Fred Gard (captain), Chas. Warton, Geo. Wallace, T. Rothery, and Dave Kenmuir.

The company sent the following first-aid team to the International first-aid competition held at St. Louis, Mo., U.S.A., where they were successful enough to tie for fourth place in the contest: Joseph Barton (captain), Charles Nicholas, James Brown, George Carson, and Joe Tyler. Sixty-four teams competed. In such a large contest, working under different conditions, Nanaimo's showing was splendid. The company paid the team's expenses in addition to reimbursing them for the loss of wages sustained by them while away.

On Labour Day, at Cumberland, in the field-meet first-aid and mine-rescue competition, conducted by the V.I.M.S.A., the following first-aid team from Nanaimo won the Coulson cup: D. Simpson (captain), Wm. Thorpe, Wm. Neave, L. Samaan, and Seth Norris. Nanaimo also secured second prize in the two-man event.

Nanaimo's first-aid ambulance class continues to be held once a week in the Odd Fellows' Hall. During 1921 it has experienced a very flourishing condition from the point of membership, having 219 seniors and 30 juniors, making a roll total of 249. The 1920–21 examinations brought forth the following results: Fifteen got first-year certificates; four got second-year vouchers; three got medallions for third year; five got labels for fourth year; and three juniors' certificates were granted for first year.

It is rather disappointing to note that no candidates appeared at the mine-rescue station to undergo a course of mine-rescue work this year. Perhaps this condition can be laid down to the fact that the work is both irksome and laborious and therefore does not induce men to undergo the test. In the mine-rescue competition held at Cumberland on Labour Day a Nanaimo team won second prize, six Elgin watches. Their score was 498 points. Team: R. Laird (captain), J. Sutherland, T. Parkinson, Francis John, A. W. Courtney, and J. Hodgson.

The mine-rescue station at Nanaimo is under the supervision of J. D. Stewart. He is assisted by George Yarrow, the Western Fuel Corporation's instructor of mine-rescue apparatus. The station is maintained in a high state of efficiency and contains the Gibbs and Paul approved type of breathing apparatus and outfit of accessories. No emergency calls were made at the rescue-station, although it is always ready to respond to such calls.

SAFETY-FIRST WORK.

The safety engineer of the Canadian Western Fuel Corporation mines is Arthur R. Wilson, who continues to make visits of inspection to all its collieries, surface and underground, including the wharf and machine-shops, with the object of preventing accidents.

Warning notices are placed in conspicuous places, both on the surface and underground, intended to attract the attention of the employee and warn him to beware while at work, to give the best of care and attention to his personal security from accidents.

INSPECTION OF MINE ON BEHALF OF WORKMEN.

According to section 91, rule 37, of the "Coal-mines Regulation Act," the workmen are entitled to appoint one or two of their number to make an inspection of all the mine once a month. This was done regularly and no adverse report was received at this office during the year.

Gob-fires, South Side.

The workings in No. 2 South level, which were abandoned and section sealed off last year, has now been reopened from No. 4 South level section, which lies to the dip of No. 2 South level workings. So far no evidence of heating-up has occurred and extraction of pillars continues without interruption.

In No. 2 East level section reopening was commenced a short time ago, but had to be abandoned on account of heating-up. It is proposed to re-enter the panel from another point, some time in the future, when other portions affecting the section are securely sealed off.

Pacific Coast Coal Mines, Ltd.

SUQUASH COLLIERY.

Samuel D. Wark, Manager; C. S. Congalton, Fireboss.

This colliery is situated about 12 miles north of Alert Bay, on Vancouver island. During the year the only work done underground has been repair-work, restoring ventilation, and keeping mine clear of water. On the surface considerable surveying and location-work has been done, with the object of building a railway for handling the coal from the mines to tide-water and find a suitable shipping-point for the large tonnage which will be handled at some future date from this property.

It is intended to drive another opening to tap the seam on a grade of 1 in 6 and wide enough for two tracks to accommodate an endless-rope system of haulage. Simultaneously with the driving of the slope a modern tipple and washery will be erected, also wharves, bunkers, and railway.

The development done at this mine to date is as follows: A shaft 6 by 10 feet in the clear is down 170 feet, with a midwall between. One compartment is used for hoisting and also serves as downcast; the other compartment is used for an upcast. Parallel levels are driven from the shaft-bottom—one pair N. 45° W. and the other pair S. 45° E. The North-west levels have been driven approximately 500 feet. The South-east levels have been driven a distance of 1,200 feet, and long-wall exclusively has been opened up in this level, there being twenty-six places ready for operating on this face. Two hundred feet from the shaft on the South-east levels a pair of slopes are driven N. 45° E. for a distance of 1,700 feet. On the same level, 800 feet from the shaft-bottom, another pair of slopes have been driven N. 45° E. for a distance of 750 feet.

The coal is of excellent quality; it is very hard and practically smokeless. The thickness of seam averages about 6 feet.

Permanent installations at this colliery are as follows: One Goldie-McCulloch high-pressure boiler, 100 horse-power; two Goldie-McCulloch high-pressure boilers, 150 horse-power each, have been installed and foundations are in place for two more; a pair of winding-engines, 24- by 36-inch cylinders and 9-foot drum; permanent buildings, covering all machinery installed, have been erected; also the superintendent's residence and a model bunk-house of thirty-six rooms. There are also ten four-roomed houses and ten two-roomed houses, also a large store building. Telephone communication is established with the wireless station at Alert Bay.

A generator and engine have been installed to furnish light for the buildings of the plant and dwellings. The ventilation of the mine is produced by a Sheldon fan, 4 by 2½ feet, making 125 revolutions a minute. The fan is steam-driven.

NORTHERN INSPECTION DISTRICT.

Report by Thos. J. Shenton, District Inspector.

TELKWA COLLIERY.

This mine was operated for a period of five months during the year 1920 and an output for the same period of 1,400 tons of coal was made.

Note by Provincial Mineralogist.—The Telkwa Colliery is not mentioned this year by the Inspector, but it has been learned from the Resident Mining Engineer, J. D. Galloway, that the property has not been operated.

AVELING COLLIERY.*

BETTY MINE.

This coal-mine is situated some 6 miles from the town of Telkwa up the Telkwa river, on the left bank of the river. At present the mine is under lease to J. Gillespie and J. Wilson and is managed by J. Gillespie. Before operation commenced this year at this property, which is owned by Major Aveling, of England, the Government had a bridge erected across the Telkwa river to facilitate the transportation of the coal; this was completed in the month of September, immediately after which operations began. A new camp has been built to accommodate the men engaged, and coal-bunkers to carry about 20 tons of coal have been erected at the end of the bridge and chutes arranged to permit the loading of the wagons, in which it is shipped to the railway siding at Telkwa.

Two main adits have been driven in opening up the vein, which is about 18 feet thick and fairly clear of dross. Some trouble had been encountered in opening up the seam as desired by a slope on the true dip of the vein as at first attempted, and it was thought wise to drive in the adits at right angle to dip or direction of intended slope, and after reaching the point directly in line with the slope as mentioned, to drive the slope adit outward from this point to the surface; but ere the point could be reached trouble in the vein occurred, which for the time has interfered with the plan. The low entrance at which the vein was opened in the adits mentioned was such as to be almost even with the bed of the river, and due to a recent ice-jam the ice was forced into the adit, and the track was so completely covered with ice that the haulage of the coal was interfered with, and the No. 2 adit had to be abandoned until conditions were more favourable.

The coal in quality is very good for steam purposes and fairly good for domestic purposes, and is now making a record for itself in the market at Rupert and the places along the railway. During the five months of operation the output was 800 tons and an average of six men employed. In all inspections of the operation by me I have found all conditions to favourably agree with the "Coal-mines Regulation Act."

Note by Provincial Mineralogist.—The usual and requisite official return of output for the year has not been received either through the Inspector or direct from the operators. On February 20th, in response to a telegraphic inquiry, a wire was received from J. Gillespie, the operating lessee, that he had shipped about 800 tons of coal, all of which was consumed in the Province, and such amount was entered in the statistical statement of output.

FRASER LAKE COLLIERIES, LTD.

I made a visit early in the year to the town of Endako with the intention of looking into the coal prospect of this company situated at Fort Fraser. Here I met the manager of the company, C. J. Kettyle; he advised me that at that time they had not decided to open up the property, as they were awaiting a decision of the Government *re* taking-up of coal land, and when this was decided favourably they would then be in a position to commence business, and that if this took place he would let me know, as I intended to visit them again. However, I have through reliable sources found out that during the current year nothing was done.

NICOLA-PRINCETON INSPECTION DISTRICT.

REPORT BY JOHN G. BIGGS, INSPECTOR.

I have the honour to submit my annual report as Inspector of Coal-mines for the Nicola-Princeton Inspection District during the year 1921.

The companies operating during the year are as follows: The Middlesboro Collieries, Limited; Coalmont Collieries, Limited; Fleming Coal Company; Princeton Coal and Land Company; and the Chu Chua Coal Company; there being no change in the mining companies operating during the year.

Forecasting in the 1920 annual report that the Coalmont Collieries would be developed to a large producing mine during the present year I feel was quite justified, as these mines may

* *See also* Report, Resident Engineer, page 103.

now be classed among the larger producing mines of the Province. This colliery, situated on the Kettle Valley Railway, is in easy access to the Great Northern Railway, where a large amount of the output is finding a ready market in the United States.

I expect to see a more vigorous policy adopted by the Chu Chua Coal Company during the year 1922, as indications go to show that this will be extensively developed, being very accessible to the Canadian National Railway. It is at present the only producing coal-mine served by this railway in the Province and in close proximity to the city of Kamloops.

It is very gratifying to report that we have had no fatal accidents in this district during the year; while two of a rather serious character have been reported to this office. One occurred at the No. 4 mine of the Middlesboro Colliery on July 19th, when a driver, trying to pass a trip in motion to reach a mule, stumbled, fell against the cars, was carried along, with the result that he was squeezed against a post, resulting in a fractured pelvis. It is most unfortunate that drivers who, as a general rule, are very competent and active will take unnecessary chances, and indeed are frequently reckless.

A miner who was in the act of pulling down some rock at the face of his stall on a 30° pitch at the Fleming Colliery on December 29th misjudged the quantity, with the result that it rolled with the pitch of the seam, caught his leg against a post, resulting in a comminuted fracture above the ankle.

The coal-mines in the Merritt district are capable of sustaining a much larger output, but have been subject to a large amount of idle time during the year. This may be attributed to the coal companies depending to a large extent upon the Canadian Pacific Railway Company, and any slight depression on the railways appears to reflect very seriously at the mines, while the importation of fuel-oil for locomotives has a very serious effect upon the market for steam-coal.

MINE-FIRES.

The mines in this district have been very free from this source of trouble during the year, with the exception of the No. 1 mine of the Princeton Coal and Land Company, where there were indications of heating in the gobs. Fortunately this trouble was found to be local and the areas affected limited; they were sealed off by stoppings, which were very effective in preventing further trouble.

The coal-seams in this district are very susceptible to spontaneous combustion, and any crushed pillars or coal left in the gobs are subject to heating and require very careful attention. Unfortunately it is impossible to extract all the coal in the larger seams, where the only feasible method of work to be adopted is the panel system, with all disused and abandoned portions of the mines well sealed off by means of carefully and well-built stoppings to exclude the air.

FIRST-AID AND MINE-RESCUE WORK.

I am pleased to report an active interest displayed in first-aid and mine-rescue work during the year. A large class has been conducted in Merritt during the year under the tuition of Dr. Tuttil, assisted by a number of the older students, all showing a great desire to acquire a knowledge of first-aid treatment to the injured; while a very successful class has been conducted at Coalmont under the able tuition of Dr. Sheffield.

This work cannot be too highly commended, and great credit is due to the members who devote their time in an earnest desire to acquire the principles of rendering first aid to the unfortunate ones who may, in following their daily avocation, require the immediate services of a trained first-aid man.

The standard of mine-rescue work has been well maintained at the Middlesboro Rescue-station during the year; while a number of the older employees have taken supplementary training, eleven employees have taken a full course in mine-rescue work and qualified for certificates of competency.

This station is maintained in a high state of efficiency, where the apparatus of the Department of Mines, together with the apparatus of the Middlesboro Collieries is under the care of Mr. Stone.

During the year the Department of Mines installed two of the latest type of Gibbs rescue apparatus, making a total of four Gibbs apparatus and six of the Draeger type, with the necessary resuscitating devices fully equipped and ready for immediate use. This is the only station in this district where the rescue apparatus is maintained in an efficient state for

immediate use, for while the different mining companies provide this apparatus, it does not receive the care and attention required and is not in a fit state for immediate use.

Edison electric safety-lamps are in use by all the workmen at the mines in this district, having been installed during the year by the Coalmont and the Chu Chua Collieries as required by 1921 amendment to section 91, Rule 8, of the "Coal-mines Regulation Act."

Samples of mine-air have been tested with the Burrell gas-detector at all the mines in operation during the year, which show the quantity of methane in the air-currents to be fairly low.

Inspection on behalf of workmen, as required by section 91, Rule 37, of the "Coal-mines Regulation Act," has been well adhered to at the larger mines of the district, the reports having always been satisfactory, while at the smaller mines no attempt has been made to comply with this rule.

MIDDLESBORO COLLIERY.

Robert Fairfoull, Manager.

This colliery is situated at the foot of the hill, about a mile west of the Merritt Railway Station, and is served by a branch line of the Kettle Valley Railway, this branch serving both the Middlesboro and the Fleming Colliery.

No. 4 Mine.

James Fairfoull, Overman; George Hudson, William Halliman, Thomas Archibald, Louis Clark, and Robert Drybough, Firebosses.

This mine is by far the largest and most extensive of the Middlesboro Collieries and is situated at the foot of the hill on the same elevation as the tipple; it is developed by means of a large and well-kept level passing through the Nos. 4, 5, 6, 8, and 9 seams. The portions of the Nos. 4 and 5 seams that can be reached from this level have been extracted and the seams at present in operation are the Nos. 6, 8, and 9. The measures have an inclination of 30° S.W., the seams averaging from 5 to 6 feet in thickness of fairly good bituminous coal overlaid with a shale roof.

The method of work is a modification of the pillar-and-stall system, with a pair of headings driven to the full pitch of the seam to the surface croppings, which are reached at a distance of 1,000 feet from No. 4 level, for facilitating the handling of the mine-timber and ventilation purposes. All the operations are to the raise of No. 4 level, and owing to the pitch of the seams the coal is conveyed from the workings by means of chutes, where it is loaded into the mine-cars by loaders, drawn by mules to landings, and hauled to the surface by main and tail rope haulage.

From the headings, levels are driven following the strike of the seams, with the necessary crosscuts to the required distance, when the coal in the pillars is extracted, all the coal being loaded into small dump-cars, trammed by hand to the Main heading and dumped, which convey the coal to the level. All the coal is taken out of the No. 4 level from this mine, with the exception of the upper part of No. 9 seam, which is hoisted out of a slope by means of a compressed-air hoist situated at the surface and lowered over a surface incline to the tipple.

During the year No. 4 level has been extended a distance of 150 feet, being driven in the hard sand rock a little below the foot-wall of the seam and broken through into the coal as required; this system prevents any heavy timbering being required in the level, also any squeezing taking place on the level when the pillars are being extracted above.

During the year mining has chiefly consisted in the drawing of pillars, the coal being mined by hand and blasted when required, permitted explosives being used and all shots being fired by electric detonators under the supervision of certified shotfirers.

Ventilation is produced by a rope-driven 8.5 double-inlet fan connected to a 14 by 18 Ideal steam-engine, which is greatly assisted by the natural ascensional ventilation of the mine. This fan is situated near the entrance to the tunnel and is so constructed as to be reversed when required, and upon my last inspection ventilation measured showed 41,000 cubic feet of air a minute passing into this mine, divided into three splits, each having separate openings through Nos. 6, 8, and 9 seams, passing 9,100, 17,400, and 14,500 cubic feet respectively for the use of seventy-two men and three mules. Speed of fan, 120 revolutions a minute; water-gauge, 0.6 inch; barometer, 27.2 inches; thermometer, 42° F.

The brattice doors and stoppings were in good order, with the air well conducted around the working-faces, and the ventilation very good. I have not at any time been able to find any trace of explosive gas with a safety-lamp, and have made several tests with the Burrell gas-detector with the same results. The working-places are well timbered and a sufficient supply of suitable timber provided for the use of the workmen. The roads and airways are in fairly good condition and free from dangerous accumulations of coal-dust.

No. 4 East Mine.

A. D. Allen, Overman; R. S. Brown, Fireboss.

This mine is situated a short distance to the east of the entrance to No. 4 mine and is operating No. 4 seam on the dip side of No. 4 mine, and consists of a pair of 15° slopes driven east a distance of 1,300 feet, which owing to the faulted nature of the ground have not been extended during the year. The seam in this mine is found at varying inclinations, with a large amount of overlapping, while during the year all the work has been in the lower level and mining has been to a large extent of an exploratory nature, these headings being driven to close proximity to No. 1 level, where a barrier of coal has been left and the coal on the sides of the headings extracted and the pillars drawn.

The method of haulage underground is by means of a small hoist and mules to a landing at the foot of the slope, and by a steam-driven hoist situated near the entrance to the slope for hoisting to the surface.

Ventilation is produced by a quick-running belt-driven fan driven by a small steam-engine capable of producing 40,000 cubic feet of air a minute, against a 1-inch water-gauge. During my last inspection ventilation measured showed 27,000 cubic feet of air a minute passing into this mine for the use of fourteen men and two mules. Water-gauge, 0.4 inch; barometer, 27.8 inch; thermometer, 32° F. The doors, stoppings, and brattice were in good order and the air well conducted around the face.

Only on one occasion during the year have I been able to detect explosive gas in this mine, owing to a leaking stopping which allowed the air to short-circuit, which was immediately remedied. I have made several tests with the Burrell gas-detector in this mine during the year and find the return air carrying 0.25 of 1 per cent. of methane. The working-places are well timbered and a sufficient supply of suitable timber provided for the use of the workmen. The roads are well timbered and in fairly good condition and free from dangerous accumulations of coal-dust.

No. 4 East Prospect.

This mine consists of a small area of the No. 4 seam which has been cut off the seam by faulting, and is developed by means of slopes driven from the croppings between the No. 4 and the No. 4 East mine. These slopes strike the coal at a distance of 80 feet where the mine has been opened upon the pillar-and-stall system, and owing to the limited area of the ground mining is very restricted.

During my inspections I have always found the ventilation of this mine to be good, the roads and working-places well timbered, and a good supply of suitable timber provided for the use of the workmen.

The coal is mined by hand and very little blasting is required, which is done under the supervision of certified officials. The roads, being naturally damp, are free from coal-dust.

The coal-seam in this mine is pitching 25°, the coal being loaded into dump-cars at the face and emptied into chutes, loaded into the mine-cars on the level, and taken by mule-haulage along the level to the foot of the slope and hoisted to the surface by means of a steam-hoist.

No. 7 MINE.

Andrew McKendrick, Overman; Thomas Rowbottom, David Crawford, and Mathew McKibben, Firebosses.

This mine is situated in the Coal Gully series at an elevation of 400 feet above the tipple and the entrance to No. 4 mine, operating the No. 4 seam, which is 15 feet in thickness, dipping 25° south and overlaid by a sand-rock roof, and working the upper 10 feet of the seam.

The mine is developed by means of slopes driven to the full pitch of the seam, levels being driven from each side of the slopes; all the work being driven to the rise of the levels and during the year has consisted of drawing pillars, which have been extracted to No. 7 level.

The ventilation is produced by a small quick-running belt-driven fan of the Guibal type, driven by a compressed-air engine situated near the entrance to the mine. During my last inspection ventilation measured showed 17,100 cubic feet of air a minute passing into this mine for the use of twenty-one men. Speed of fan, 150 revolutions a minute; water-gauge, 0.3 inch; barometer, 27.76 inches; thermometer, 34° F. The doors and stoppings were in good order and the air well conducted around the working-faces.

During the year I have not been able to find any trace of explosive gas with a safety-lamp, while testing with the Burrell gas-detector shows the ventilation current to contain 0.2 of 1 per cent. of methane. All the working-places were well timbered and a good supply of suitable timber provided for the use of the workmen, while the roads were well timbered and in fairly good condition and, being naturally damp, were free from coal-dust.

Work has been continued during the year at the seams of coal cropping in Coal gully below the No. 7 seam. On the East side the No. 5 seam is being developed by means of slopes driven a distance of 250 feet, showing 5 feet of fairly good coal; while on the West side of the gully the No. 1 seam is being developed by means of levels following the strike of the seam a distance of 300 feet, the measure being somewhat faulted; the seam is 7 feet in thickness and of a soft nature, and the work of a prospective character. The coal is hauled to a siding near the entrance to No. 7 mine by means of a small compressed-air hoist.

The coal at these mines is mined by hand and blasted, when required, by explosives of the permitted class, all shots being fired by electric detonators under the supervision of competent persons appointed for the purpose. Edison electric safety-lamps are used by the workmen and safety-lamps of the Wolf pattern by the officials for inspection purposes.

The coal from No. 7 and the upper part of No. 9 mine is collected by means of air-hoists at a siding situated at the top of a surface incline, and is lowered over this incline by 2-car trips to the tipple, the cars having a capacity of 1.5 tons, where they are unloaded by means of a Phillips crossover dump; a switchback and a chain creeper haul the cars back for distribution to the different mines. The coal passes from the dump to a rotary picking-table, to a shaking screen, where it is sized and stored in the bunkers and loaded into railway-cars as required.

During the year an horizontal tandem-compound Ideal engine, 10 by 18 by 12 inches, direct-connected to a 60-cycle alternating generator, 2,300 volts, 17 amperes, running at 275 revolutions a minute, with the necessary transformer bank and panel, has been installed in the compressor-house for operating a 2-stage centrifugal motor-driven pump at the river to replace the small steam plant which provides water for the power plant and domestic purposes.

Copies of the "Coal-mines Regulation Act," special rules, with plans, are posted near the entrance to the mines.

The mine-rescue station has been well maintained during the year, where, in addition to the equipment installed, two of the latest type of Gibbs rescue apparatus have been installed by the Department of Mines during the year.

The following are the official returns from the Middlesboro Colliery for the year ending December 31st, 1921:—

Name of seams or pits—No. 4, No. 4 East, No. 7, No. 5, East, and No. 5 West mines.

Description of seams, tunnels, levels, shafts, etc., and number of same—No. 4 mine, in which coal is mined from No. 6 and No. 8 seams; No. 4 East, from which No. 4 seam is mined; No. 7 mine, No. 4 seam is also mined from this mine; No. 5 East is in No. 5 seam; No. 5 West, No. 1 seam.

Description and length of tramway, plant, etc.—No. 4 seam: Access to the workings of this mine is gained by an entrance near the tipple; thence by a horizontal tunnel first driven in No. 5 seam; then by crosscutting the measures to No. 4, and again from No. 4 to No. 6 and No. 8 seams. The seams in this mine vary in thickness from 4 to 18 feet and pitch south, the angle of inclination being 30°. The coal is conveyed from the face to the mine-cars by chutes, and then hauled to the tipple by means of compressed-air hoists and ropes. Ventilation is produced by a Sheldon fan 8.5 feet in diameter, connected to an Ideal steam-engine, 14 by 18 inches, and is so arranged that the direction of the current can be changed. No. 4 East: This mine is operated by means of a slope driven east. The coal in this mine varies from 12 to 20 feet in thickness; pitches south-east, the angle of inclination being 15°. Haulage-rope is connected to steam-hoist. No. 7 mine: Operations in this mine are now

confined to the extraction of the pillars. No. 5 East: This mine is operating in No. 5 seam. A slope is now being driven east in the coal. No. 5 West: A horizontal tunnel has been driven in this mine a distance of 400 feet in the No. 1 seam, the direction being west. The coal in this mine pitches south, the angle of inclination being 15°. Haulage is by compressed-air hoist to the main landing; then by the same gravity-plane as the coal from No. 7 mine to the tipple. The main power plant is situated near the tipple, consisting of four return-tubular boilers, each 160 horse-power; Canadian Rand cross-compound compressor with a capacity of 2,000 cubic feet of free air a minute; Ideal compound engine direct-connected to a 75-kw. 2,300-volt General Electric generator; 25-kw. direct-current steam-engine set for lighting purposes.

COAL HILL COLLIERY.

A. E. Smith, Manager.

This colliery is situated south-west of the Middlesboro Collieries, on the west side of Coal gully and about 1½ miles from the city of Merritt, and has operated in the No. 2 seam of this property during the whole of the year.

No. 2 MINE.

John T. Brown, Overman; George Maxwell, John Watterson Smith, James Sim, and Richard Dunnigan, Firebosses.

This mine is situated about 400 feet west of the entrance to the old No. 3 mine and has been developed by means of a pair of slopes driven to the full pitch of the seam a distance of 800 feet, where the boundary of this property is reached at this point. This seam has an average thickness of 6 feet, intersected by bands of rock and bone of varying thickness, and is generally overlaid with a good shale roof. The seam pitches S.W. 30° and the mine is developed by the pillar-and-stall system, with 50-foot centres, with stalls 12 feet in width. All the coal has been extracted to the east side of the slopes and the present workings consist of four levels driven west, with 200-foot lifts, and owing to the pitch of the seam all the coal is brought from the face of the stalls by means of chutes and loaded into the mine-cars on the levels.

The No. 1 level is the most extensive and has reached a distance of 1,000 feet, with twenty-one stalls driven to the full pitch of the seam to the crop-line, the whole work being followed up by the extraction of the pillars, sufficient being left to support the levels.

The method of haulage on the levels is by horse and hand; the mine-cars, having a capacity of 1 ton, are loaded at the several chutes, drawn to the landings situated near the slope, and hoisted to the surface in 4-car trips by means of main-rope haulage.

This mine is ventilated by means of a single-inlet belt-driven Aelos fan 6 feet in diameter, capable of producing 50,000 cubic feet of air a minute, against a 1-inch water-gauge, driven by a 60-horse-power steam-engine, which I have always found to be very good.

Upon my last visit of inspection the ventilation measured showed 36,000 cubic feet of air a minute passing into this mine, divided into two splits. In the lower split I found 16,000 cubic feet of air a minute passing for the use of seventeen men, and 20,000 cubic feet of air a

minute passing into the top split for the use of twenty-seven men and one horse. Water-gauge, 0.4 inch; barometer, 27.2 inches; thermometer, —4° F.

The doors, brattice, and stoppings were in good order and the air well conducted around the faces. While taking tests with the Burrell gas-detector, I failed to show any trace of methane in the air-currents. The working-places were well timbered and a sufficient supply of suitable timber was provided for the use of the workmen, and the mine is very free from dangerous accumulations of coal-dust.

All the coal is mined by hand and blasted, when required, by explosives of the permitted class, all shots being fired with electric detonators under the supervision of certified shotlighters appointed for the purpose. Edison electric safety-lamps are used exclusively by the workmen and safety-lamps of the Wolf pattern by the officials for inspection purposes.

From a siding near the entrance to the mine the cars are lowered by tail-rope haulage a distance of 2,000 feet to a landing at the top of the gravity-plane, while the tail-rope hoist hauls the empties back to the mine. This gravity-plane is connected directly with the tipple, 2,000 feet in length, and is provided with a Stine wheel, 1-inch steel cable, and is operated with 6-car trips. The cars are dumped by an ordinary tip-dump, where the coal is cleaned before going into the bunkers, which have a capacity of 500 tons, the coal being drawn as required and loaded into railway-cars. This tipple is directly connected to the Kettle Valley Railway by means of a standard-gauge track 1 mile in length.

There have been no additions made at this plant during the year, with the exception that the 6-foot Aelos fan which was used for ventilating the No. 3 mine has been installed at the present mine during the early part of the year, replacing the small direct-driven Sheldon fan.

The plant consists of two Leonard-type return-boilers having a joint capacity of 80 horse-power, situated at the mine, and provides steam for the Main slope hoist at dump-heap, small tail-rope hoist, fan-engine, and lighting plant, also for heating the wash and change house. A 25-horse-power vertical boiler is situated at the tipple, which provides steam for small hoist for collecting the cars at the tipple, also pump for delivering the water from the storage-tank at the tipple to the mine; a small pumping plant is also situated at the river, which delivers the water to the storage-tank at the tipple. The surface equipment consists of machine, carpenter, car-repairing, and office buildings, with wash and change house at the mine.

Copies of the "Coal-mines Regulation Act" and special rules, with plans, are posted near the entrance to the mine, with systematic timbering rules.

The following are the official returns from the Fleming Collieries for the year ending December 31st, 1921:—

Totals	58		25		83	

Name of seams or pits—No. 2. The coal averages 5½ feet thick, with two ribs of rock, making the actual coal, which is bright and hard, 4½ feet thick. Owing to the bands of rock the coal is very tight in the seam, requiring much more than the usual amount of explosives. The levels have been advanced to the west from the boundary, some as much as 1,600 feet, exposing quite a large body of coal available in pillars. There is so far an entire absence of gas and very little water. The other seams, Nos. 3 and 5, were closed during the year.

Description and length of tramway, plant, etc.—The plant mainly consists of two 40-horse-power Leonard-type and two 16-horse-power Beatty boilers. The main hoist is a 60-horse-power Ottumwa hoist, and the fan is an Aelos type of 30,000 feet capacity, driven by a 60-horse-power Ideal engine. No new additions were made to the plant, but it has been maintained in a high state of repair. The bunkers are of 400-ton capacity and connected to the mine by a self-acting tramway 1,800 feet long.

CHU CHUA COLLIERY.

James Gray, Manager; William Holdsworth, Fireboss.

This property is situated 55 miles north of the city of Kamloops, on the east side of the Thompson river, the present openings being about 1 mile from the Canadian National Railway, and comprises part of the foot-hills and flats situated on each side of the Newhykulston creek on the Indian reservation and adjoining the holdings of the Wigan Collieries.

Several small seams of coal of a high-grade character are to be seen outcropping on the sides of the creek, lying very conformably and dipping into the foot-hills at an angle of about 20°; and while these seams are so well defined and of a good quality, it is somewhat doubtful if it will be possible to work them with any commercial success owing to their being somewhat small and intersected with rock-bands.

Until the latter part of the present year all the work has been concentrated in the top seam, which has been developed by means of a pair of adit levels driven from the croppings at the side of the creek and following the strike of the seam for 300 feet. The coal at the face of

these levels is about 3 feet in thickness, intersected by two rock-bands 100 feet from the entrance of the Main level. Slopes were driven to the full pitch of the seam a distance of 200 feet, being of a prospective nature; while it was found that there was no material difference in the thickness of the coal, there was a marked increase in the thickness of the rock, with the result that at the latter part of the present year it was decided to take out the track, withdraw all equipment, and suspend operations.

This mine has been developed by the long-wall system, the main gates being well brushed and packed. Chutes are used for carrying the coal from the faces to the mine-cars and all waste material is used for packing the gobs. The roof overlying the coal-seam, being composed of sand rock, made conditions very favourable for this method of work. All the coal is mined with coal-cutting machines of the post-puncher type and blasted, when required, by means of permitted explosives under the supervision of certified officials appointed for the purpose.

Gray Seam.

Some 600 feet below the No. 1 mine a seam of coal has been exposed in the Newhykulston creek, which was again proved by a Calyx drill 200 feet north of the creek, when a 30° haulage-slope was driven, cutting the seam at a distance of 80 feet, where there was found to be a good seam of coal 5 feet 4 inches thick, intersected by 6 inches to 1 foot of bone coal. The slope was driven down 160 feet at the end of the year and all work concentrated at this seam. The mine-run is hauled out of the slope by means of a small compressed-air hoist, dumped into a small bunker, and hauled by teams to the railway siding, a distance of 1 mile.

The power plant consists of one 44-horse-power locomotive-type boiler; one single-stage compressor, capacity 270 cubic feet of free air a minute; one small steam electric plant for lighting purposes and battery-charging.

I have always found the general conditions of these mines to be good, well ventilated, and free from explosive gas. The roads are in good condition and the working-places well timbered, and a sufficient supply of suitable timber is provided for the use of the workmen. The mines, being naturally damp, are free from coal-dust.

As required by 1921 amendment to section 91, Rule 8, twenty-five Edison electric safety-lamps have been installed at this mine for the use of the workmen, and safety-lamps of the Wolf type are used by the officials for inspection purposes.

Copies of the "Coal-mines Regulation Act" and special rules are kept posted near the entrance to the mines, also a good supply of first-aid appliances are provided.

The following are the official returns from the Chu Chua Colliery for the year ending December 31st, 1921:—

Sales and Output for Year.	Coal.		Coke.

Name of seams or pits—No. 1 seam, now called the Thomas seam; No. 3 seam, now called the Gray seam.

Description of seams, tunnels, levels, shafts, etc., and number of same—Thomas seam: An adit level which starts from outcrop near creek, and is in a distance of 380 feet, was stopped owing to being too near the surface outcrop. Counter-level is in same distance; crosscuts 60-foot centres; seam pitches 20° to 23°. At 90 feet from surface on level a slope was started to the dip and was down a distance of 220 feet and opened out at long-wall. Coal-seam, 36 inches thick, with three bands of rock in same; sand-rock roof. Good domestic and steam coal. Gray seam: A slope was started from surface and cut into seam, which was struck in a bore-hole 40 feet from surface. Slope is now down 146 feet, from which levels are being driven right and left, and a raise is being put back to surface for ventilation. Crosscuts between levels, 60-foot centres; seam pitching 20° to 22°. Coal-seam is 60 inches thick, with three small bands of rock, and has a good roof. Good domestic and steam coal.

Description and length of tramway, plant, etc.—Coal is dumped into bunkers at No. 3 Gray seam, of 140 tons capacity, near entrance to slope; thence hauled by team a distance of half a mile to siding on Canadian National Railway for shipment. A tramway will be built during 1922; also two or three more drill-holes put down to further prove the property. The plant consists of one 44-horse-power boiler, locomotive type; one compressor, capacity 270 cubic feet of free air a minute; one steam electric plant for lighting, charging lamps, and for driving fan, with a total capacity of 75 kw. This plant will also be further increased during the year.

Coalmont Collieries, Ltd.

Head Office—Coalmont, B.C.
Capital, $3,000,000.

Officers.	*Address.*
W. J. Blake-Wilson, President,	Vancouver, B.C.
Gen. J. W. Stewart, Vice-President,	Winnipeg, Man.
A. H. Douglas, Secretary-Treasurer,	Vancouver, B.C.
Donald McLean, Manager,	Coalmont, B.C.

COALMONT COLLIERY.

Donald McLean, Manager; Alex. Bryden, Overman; John McMurtrie, Thomas Bysouth, Thomas Leeman, Robert Gourley, and John W. Sanders, Firebosses.

The Coalmont Collieries, Limited, is operating in the Coalmont field on the north-west side of the mountain, north of Granite creek, the openings of the present mines being at an elevation of 3,600 feet above sea-level and 1,600 feet above the town of Coalmont, where the tipple is situated. Until the latter part of the year 1920 the coal was hauled from the mine to the tipple over a wagon-road by 5-ton auto-trucks, by overhead tramway, constructed over the mountain, connecting the mine to the tipple.

These mines are developed by levels following the strike of the seam and are known as the Nos. 2 and 3 mines in the No. 4 seam of the series, which has an average thickness of 10 feet of clean coal immediately underlaid by a series of coal-seams of varying quality having an aggregate thickness of 80 feet.

The No. 2 levels are by far the most extensive and from which the larger portion of the present output is being extracted. Following the coal a distance of 3,250 feet from the entrance, they have not been extended during the year, standing at what is anticipated to be a 40-foot dip-fault, 200 feet from the face; a level is being driven cutting the measures to the raise, which is expected to prove this fault.

The measures are lying conformably and have an average of 29° W. All the work on No. 2 mine is driven to the rise and developed by the panel system, each panel being provided with a separate intake and return. Headings are driven to the full pitch of the seam and reach the croppings in the first panel at a distance of 600 feet from No. 2 level, with the crop-line of the seams heading away, and as a result a pair of levels known as the No. 1 levels have been driven to reach the coal to the rise, also to facilitate the handling of the timber for the use of the workmen. All the working-places are driven 12 feet wide, with the stalls following the strike of the seam, where the coal is loaded into dump-cars, trammed by hand, dumped into chutes, and conveyed by this method to No. 2 level, loaded into mine-cars, taken in trips by horse-haulage to the surface, lowered over a small gravity-plane to a landing on the same elevation and near the entrance to No. 3 mine, where all cars are collected and hauled by means of a 3-ton Jeffrey trolly-motor to the top terminal of the overhead tramway.

The No. 3 mine is situated 400 feet east of No. 2 and is developed by means of a fine 8 by 12 well-timbered tunnel known as the Wilson level, with the necessary counter, following the strike of the same coal-seam as No. 2; it has been operated during the whole of the year and extends a distance of 1,800 feet on the same elevation as the top terminal of the overhead tramway, and will eventually be the main level for developing this property.

The method of work adopted in this mine is very similar to No. 2, with the exception that the mine-track is laid in the headings, with back switches into the stalls, the mine-cars being hoisted by a small compressed-air hoist situated near the top of the heading.

All the coal is mined by hand and blasted, when required, by permitted explosives, all shots being fired by electric detonators under the supervision of certified officials appointed for the purpose.

Ventilation is produced by a 5-foot "booster" fan manufactured by the American Blower Company and is situated at entrance to fan-drift, 200 feet east of No. 2 level; it is built for producing 38,000 cubic feet of air a minute, against a 1-inch water-gauge, belt-driven by a 30-horse-power induction-motor.

During my last inspection ventilation measured showed 29,680 cubic feet of air a minute passing into this mine, divided into two splits. No. 2 mine showed 24,680 cubic feet a minute passing for the use of fifty men and seven horses, and No. 3 mine showed 5,000 cubic feet for the use of twenty-one men and one horse. Speed of fan, 1,000 revolutions a minute; water-gauge, 0.4 inch; barometer, 26 inches; thermometer, 24° F. The air was well conducted around the working-faces and the doors, stoppings, and brattice were in good order. The working-places are well timbered as required by the special rules and a good supply of suitable timber provided for the use of the workmen.

During my inspections I have not been able to find any trace of explosive with a safety-lamp, and upon examining the official report-books I fail to see where there has been any trace of explosive gas found in these mines. I have made several tests with the Burrell gas-detector during the year and have failed to find any trace of methane in the return air-currents of these mines.

The roads are naturally damp and due to the nature of the coal these mines are free from dangerous coal-dust.

PLANT AND EQUIPMENT.

During the year there has been a large amount of work done at these mines by way of the installation of electric equipment, which is the only power in use. The main power plant is situated at the town of Coalmont, a distance of 3 miles from the mines, and consists of two 250-horse-power water-tube boilers, with cross-drum and horizontally inclined tubes fitted with forced draught, duplicate pumps and feed-water heater attached, generating power by driving a

600-horse-power Corliss compound condensing-engine coupled direct to a G.G.E. 3-phase, 60-cycle, 480-ampere, 550-volt generator running at 150 revolutions a minute.

Transformers are situated near the power plant, where the voltage is increased to 10,000, taken over high-tension cables to transformers at the mine, where it is again reduced to 550 volts for power and 110 volts for lighting purposes.

The power plant at the mine installed during the year is as follows: 50-horse-power a.c. motor situated at the top terminal of the tramway, connected by belt and spur-gearing to a 10-foot return Fowler grip-pulley for controlling the tramway; 75-horse-power a.c. motor generating-set situated in the lamp-house and used for generating power for a 3-ton Jeffrey trolly-motor used for collecting and hauling mine-cars from the foot of the gravity-plane and No. 3 mine, and hauling the same to and from the top terminal of the tramway; 60-horse-power a.c. motor for driving belt-driven air-compressor, having a capacity of 830 cubic feet of free air a minute, running at a speed of 130 revolutions a minute, this power being used for driving the air-lifts at the tramway air-hoists and auxiliary ventilation purposes in the mine; small motor generating-set for charging 200 Edison electric-lamp batteries; 30-horse-power a.c. motor for driving the mine ventilating-fan; 30-horse-power motor at the tipple and small motor in the machine-shops. The No. 2 and No. 3 tunnels, machine-shops, mine-yard, houses, tipple, etc., have been provided with electric lights during the year.

OVERHEAD TRAMWAY.

During the year 1920 there was a large staff of men employed in the erection of the surface plant, overhead tramway, and the installation of machinery and equipment for producing coal on a large scale. This tramway, which was started in November, 1920, is about 2½ miles in length and is used for conveying the coal from the mine over the mountain to the tipple, the difference in elevation between the terminals being 1,600 feet. While this method of haulage has been successfully adopted at several of the metalliferous mines in the Province for the conveyance of limited quantities of high-grade ore, it was an entirely new departure around coal-mines, from which it was expected to produce coal on a large scale. At the commencement of operations it was a complete failure and incapable of sustaining the load it was required to carry owing to the wires of the carrying cables breaking, which caused the mines to work very intermittently during the early part of the year. However, by doing the necessary repairs and reducing the load in the buckets, the management was able to get along until the spring of the present year, when all work was suspended at the mine and the tramway overhauled and remodelled.

During the year the ¾-inch locked-coil stationary or carrying cable on the empty side of the tramway has been discarded and replaced by the 1⅛-inch locked-coil cable from the full side, this being again replaced by a new 1⅝-inch track-strand, reverse-lay, smooth-coil crucible-steel cable, and the ¾-inch endless or travelling cable has been replaced by a new ⅞-inch "Lang" lay steel cable. The return grip-pulley at the top terminal was fractured and was replaced by a Fowler grip-pulley. The top terminal has been remodelled by the installation of compressed-air lifts, which are used for lifting the box of the mine-car from the frame by means of carrier-arms to an overhead single rail connected to the tramway, also for lowering the empty car-box from the tramway to the car-frame. Control-house built at the top terminal, containing the necessary brake-levers, electric switches, and telephones; several of the towers adjusted and relined; large rocking-saddles at the towers installed to replace those of a fixed type.

Tensions connected to the carrying cables replaced by large blocks and anchors; the overhead rail connected with the tramway at "anchor hill" largely extended, with the bottom terminal at the tipple strengthened by means of reinforced concrete. Perhaps the most interesting feature of the tramway is the control, for while it is equipped with friction-brakes, they are very seldom required, being controlled by means of a 50-horse-power a.c. constant-speed motor situated at the top terminal of the tramway, running at 640 revolutions a minute, connected by belt and spur-gearing to the return grip-pulley, keeping the tramway running at a constant speed, generating power when required, and acting as a brake when the tramway is generating power by destroying the synchronity of the electric field and forcing a current against the voltage of the system.

The buckets have a capacity of 1 ton and are attached to the travelling rope by means of grips. The lower terminal at the tipple is provided with automatic detachers and attachers, the buckets running by gravity to the dump and emptied into a chute connected to a Marcus shaking

screen, and is at present provided for making three classes of coal; each bucket makes a return journey in 1¼ hours, with a total of eighty buckets on the tramway, and delivering at the tipple approximately 1 ton a minute. Since the repairs and changes have been made it is very pleasing to report that the tramway is giving every satisfaction and is very free from trouble.

This tramway is only operated on the one shift, and while there appears to be an almost unlimited demand for this coal, there is at present a limited accommodation for employees.

ACCOMMODATION FOR EMPLOYEES.

The accommodation for employees at the town of Coalmont is the same as reported during the year 1920, which consists of about twenty cottages, the property of the Coal Company, with a number of private cottages and a good hotel situated on the townsite.

The large and commodious rooming-house at the mine was completed during the beginning of the year and furnished to accommodate seventy-two men; this building is steam-heated, electric-lighted, and all bedding and furnishings are provided by the company to ensure cleanliness and comfort for the employees. This rooming-house is connected by a covered passage-way to a large combined change and wash house, steam-heated, provided with shower-baths, wash-basins, lockers, and large lavatory, which includes every convenience.

A large dining-room, well provided, comfortably furnished, well equipped, electric-lighted, steam-heated, with the necessary stores, is situated near the rooming-house, with accommodation for about 100 men.

During the year three officials' houses, doctor's office, and a number of small houses have been erected at the mine. The doctor's office is supplied with hot and cold water and well provided, with the doctor being in daily attendance at the mine.

The rooming-house, dining-room, and the wash-room are heated by a 42-horse-power Jencks tubular boiler situated at the mine, providing all the hot water necessary, while a water system with the necessary hydrants and hoses have been installed during the year for domestic and fire-protection.

As required by 1921 amendment to section 91, Rule 8, of the "Coal-mines Regulation Act," a modern lamp-house has been erected near the entrance to No. 3 mine, with the necessary repair-benches, charging-racks, small motor generating-set, with the installation of 200 Edison electric safety-lamps for the use of the workmen; while copies of the "Coal-mines Regulation Act," special rules, with systematic timbering rules and plans of mines, are kept posted near the entrance to the mines.

The following are the official returns from the Coalmont Colliery for the year ending December 31st, 1921:—

SALES AND OUTPUT FOR YEAR.	COAL.		COKE.	
(Tons of 2,240 lb.)	Tons.	Tons.	Tons.	Tons.

PRINCETON COLLIERY.

Francis Glover, Manager.

This colliery is situated near the town of Princeton, on the right bank of the Similkameen river near its junction with the Tulameen, and is situated in the Similkameen Mining Division.

PRINCETON No. 1 MINE.

William James, Overman; John Liddle, and George Walker, Firebosses.

This mine is developed by means of a pair of 12-per-cent. slopes driven to the full pitch of the seam and reaching the coal at a distance of 200 feet from the portal of the slopes. The

coal-seam averages 20 feet in thickness, the lower portion being somewhat dirty; the work is generally confined to the upper 10 feet of the seam, all work at present being confined to the extraction of pillars.

As stated in the 1920 Report, diagonal slopes had been started from the Main slope 750 feet from the portal, driven 15° west of the Main slopes, driven in a solid section of the coal which had been cut off the workings of the mine by faulting, when it was intended to extend these slopes below the present workings of the mine and again open up the mine in the lower measures by the panel system of working.

However, after being driven a distance of 500 feet there were indications of heating in the old gobs near the entrance to these slopes, and after spending some time trying to locate the source of trouble it was found to be very local, when this area was sealed off with stoppings well covered with gunite, which proved to be very effective in preventing further trouble; it being decided to extract all the coal that could be recovered on the sides of these slopes and abandon the same, and develop this seam from a new opening at some future time.

This coal is mined by coal-cutting machines of the post-puncher type, with very little blasting required, it being of a lignitic character and generally used for domestic purposes, the object being to recover it in as large a size as possible.

The coal-seam in No. 1 mine is very susceptible to spontaneous combustion and any crushed coal or small pillars left in the gob will very quickly spring into activity, providing it is allowed the necessary air to support combustion, and one has only to note the refuse and dump heaps situated at the surface to acquire a knowledge of the care and attention needed in the mine to guard against this source of danger. The chief object in view should be to obtain a system of ventilation and a mode of working that would tend to eliminate this source of trouble by adopting the panel system of working the coal, and all disused or abandoned portions of the mine sealed off with good substantial stoppings, so as to prevent any air circulating through any inaccessible roads.

Ventilation is produced by means of a small fan of the Guibal type, belt-driven by a small steam-engine, and upon my last inspection was producing 5,000 cubic feet of air a minute for the use of sixteen men. Water-gauge, 0.1 inch; barometer, 27.9 inches; thermometer, —0° F.

The method of haulage adopted at this mine is very simple, all the cars being brought by hand to the Main slope, all switching, collecting, and hoisting to the surface by means of a steam-hoist situated at the tipple.

During my inspections I have generally found this mine to be very free from explosive gas, and only on one occasion have I been able to find a gas-cap, and making a test with the Burrell gas-detector showed the return air to contain 0.15 of 1 per cent. of CH_4.

The roads were in fairly good condition and, being naturally wet, were free from coal-dust. The working-places were well timbered as required by the special rules, and a sufficient supply of suitable timber provided for the use of the workmen. Blasting, when required, is carried out at this mine under the supervision of certified officials as provided for by the "Coal-mines Regulation Act." Edison electric lamps are used exclusively by the workmen, while safety-lamps of the Wolf pattern are used by the officials for inspection purposes.

GEM SEAM.

Hugh Gillespie, Fireboss.

During the year preparation is being made to open the Gem seam, which is lying above the No. 1 seam and is being opened up from the cropping by means of a 6 by 8 well-timbered slope which has been extended for a distance of 100 feet, showing 4 feet of clean coal overlaid by a sand-rock roof, with 4 inches of mining-dirt in the floor.

This mine is situated 4,300 feet south of the No. 1 mine and about 2,000 feet south-east of the Princeton Station, and is served by the branch line of the Kettle Valley Railway which was extended to Copper mountain, which runs through the property.

The surface equipment consists of a tipple provided with a rotary tipple-dump, where the coal is dumped upon a stationary 2-inch bar-screen, where the large coal is cleaned and loaded into the cars. The coal falls through the bars to a hanging shaking screen, 12 feet in length and 6 feet in width, with ¾-inch mesh, and is collected by means of belt-conveyors, taken to the various chutes, and loaded into the cars.

The power plant consists of three return-tubular boilers with an aggregate capacity of 200 horse-power; Canadian Rand compressor having a capacity of 750 cubic feet of free air a minute, which is used for driving the power mining-machines, pumps, and small hoists in the mine; 25-horse-power mine steam-hoist situated at the tipple.

Well-equipped machine-shop, car-repairing and carpenter shop, wash-house, and lamp-house are well maintained, while a 30,000-gallon water-tank is provided for storage and fire-protection purposes.

Copies of the "Coal-mines Regulation Act," special rules, systematic timbering orders, and plans of the mine are kept posted near the entrance to the mine.

The following are the official returns from the Princeton Colliery for the year ending December 31st, 1921:—

Name of seams or pits—Same as last year, with the addition of prospecting-work on the Gem Bed seam.

Description of seams, tunnels, levels, shafts, etc., and number of same—Same as last year, with the addition of shaker screens and picking-belt conveyor. The new slopes have been stopped and the coal is being pillared.

Description and length of tramway, plant, etc. The Gem Bed seam is opening up very promisingly so far and appears to average about 4 feet from roof to floor of clean coal, with a sandstone roof approximately 70 feet thick. The coal is of very high-grade quality, sub-bituminous.

EAST KOOTENAY INSPECTION DISTRICT.

REPORT OF ROBERT STRACHAN, SENIOR INSPECTOR.

I have the honour to submit the annual report covering the coal-mines in operation during the year 1921 in the East Kootenay Inspection District.

This district is directly in charge of John McDonald, with office in Fernie, and attached to this report is his description of the various mines in operation and the conditions which prevail in and around them.

The collieries in operation were the same as in the previous year—namely, Coal Creek, Michel, and Corbin; the first two owned by the Crow's Nest Pass Coal Company, Limited, of Fernie; the latter by the Corbin Coal and Coke Company, of Spokane, U.S.A.

No attempt was made to reopen either the Hosmer Colliery at Hosmer, owned by the Canadian Pacific Railway Company's Natural Resources Department, closed down in 1914, or the Morrissey Colliery, owned by the Crow's Nest Pass Coal Company, closed down in 1909.

Seven mines were in operation at Coal Creek, three at Michel, and two at Corbin during the entire year. At the latter colliery no coal was produced from the No. 3 mine or open-cut during the year, but development was pushed on the No. 6 mine, which proved the existence of a seam of coal 420 feet in thickness.

Relations between employees and employers have been very good during the year under the agreement entered into March 31st, 1920, which expires March 31st, 1922. Provision is made in the agreement that the parties will meet in conference thirty days prior to the expiration of the agreement to discuss a renewal thereof.

While there has been no loss of work due to labour troubles, lack of demand for coal has caused a great deal of loss of work throughout the year, amounting to: Coal Creek, 96 days; Michel, 83 days; Corbin, 124 days; or a total of 303 days for the district during the year.

ACCIDENTS.

Nine accidents were reported to this office, as provided for by the "Coal-mines Regulation Act," involving death or serious disability to the same number of workmen.

Many slight accidents occurred, but were not reported to this office, owing to the Act requiring only serious or fatal accidents to be reported, except in the event of an explosion of either powder, boiler, or mine, and it is very pleasing to be able to report that no accident of this kind occurred during the year.

The accidents according to the collieries were: Coal Creek, 6, including 2 fatal; Michel, 3; and Corbin, 2. Six of these occurred on or connected with haulage, two were due to falls of coal at the working-face, and one to fall of rock on the haulage-road.

In the case of Coal Creek the two fatal accidents occurred at the same mine, No. 2, the first being to a rope-rider while riding on the rear end of a loaded trip on its way towards the outside of the mine. The overhead timbers must have been settling down and grazed the top of the loaded trip; one of the timbers or a piece of lagging must have got between the last two cars, which pulled it out, allowing the roof to cave, sweeping the rope-rider off the end of the trip, burying him, while the trip continued to the foot of the incline. Following this accident an investigation was held by W. H. Wall, at which evidence was given and a special report made to the Hon. the Minister of Mines.

The second fatal accident occurred to a miner while on his way from his working-place to the lamp-room. He had reached the mine portal, when seven cars which had become detached from a trip, which was being pushed out by a compressed-air locomotive, overcame him, knocking him down, with fatal results.

Adequate manholes are provided on this haulage-road, which has a very easy grade, but sometimes workmen, in their anxiety to get outside, take unnecessary chances in trying to keep ahead of a trip of cars, and I consider provision should be made either to provide a travelling-way entirely apart from the haulage-roads, or have some means of preventing workmen travelling while the haulage is in motion.

The other two non-fatal accidents at Coal Creek were the case of a timberman's helper, while riding a rope during repair-work, jumping off a trip while in motion, being flung against the side of the roadway, and a driver being caught between a car and the sides. In the latter

case there was plenty of room between the side of the car and the roadway, but the empty car had got off the track, and while the driver was lifting it the horse started up, jamming him between the car and the side.

No accidents were reported from Coal Creek as occurring at the coal-face, which, I feel, reflects the vigilance of both the workmen and the officials.

At Michel two accidents occurred at the working-face, due to falls of coal, and should emphasize the necessity of greater care, both by the workmen and the officials. The other accident occurred to the driver of the locomotive outside the mine, who fell off while it was in motion.

At Corbin the two accidents reported both occurred outside the mine; one to a workman while trying to tip a dump-car with a lever, the car after being almost dumped swinging back, striking the lever and in this way dislocating his collar-bone; the second was to the driver on the tipple, whose foot got entangled with the horse's reins, pulling him off the front of the car, allowing it to run partially over him.

The causes of the accidents were as follows:—

Colliery.	Haulage.	Fall of Coal at Working-face.	Fall of Rock.
Coal Creek	3	..	1
Michel	1	2	..
Corbin	2	..	..

Four of the accidents, including one of the fatal, occurred outside the mine, and five, including one fatal, inside the mine. The accidents according to occupation are: Miners, 3; timberman, 1; drivers, 2; rope-rider, 1; motorman, 1; and trackman, 1.

The rate per thousand workmen employed is 1.13, and as compared with the previous year shows a decrease of 0.76.

The amount of coal produced for each man killed is 379.877 long tons, as compared with 282.463 for the previous year.

Coroners' inquests were held in the case of both fatal accidents, at which the Department of Mines was represented by the Inspector, and we wish to extend our thanks to the Coroner for allowing us every facility to clear up the cause of the accident.

Ventilation.

The general condition of the mines with respect to ventilation is dealt with in the report attached by John McDonald and reflects much better conditions than have prevailed heretofore. As in previous years, advantage was taken of the kind offer of the Dominion Department of Mines to analyse samples of the air from the various mines, and 247 samples were taken, of which 41, or 16.6 per cent., were lost, due either to leakage or breakage.

A new ventilating-fan is being installed at the No. 1 East mine, Coal Creek, with a capacity of about 300,000 cubic feet of air a minute; the work is completed with the exception of the driving machinery. Whether it will be driven by electric power or steam has not yet been determined, for with the introduction of hydro-electric power from the works of the Alberta and British Columbia Company at Bull river the tendency will be to use electric power instead of steam.

Coal-dust.

During the year the mines have been kept fairly good with respect to the treatment of coal-dust, water being used to a great extent for this purpose. As I mentioned in my last year's report, some method of sampling the dust at regular intervals and different portions of the mine, with the resultant analysis posted at the entrance to the mine, would assist in keeping the dangers from this source well to the front.

Bumps and Blow-outs.

No fatal or serious accidents have been reported from either of these sources during the year. Small bumps have been reported occasionally, but apart from destroying or wrecking a few hundred feet of roadway, nothing more serious has been reported.

These have been reported generally from the Main Tunnel district of No. 1 East and may have been due to a fault which has been encountered there; this fault has a displacement of about 40 feet and the sides are very well defined. Work is now proceeding to penetrate through the fault and probably some change in the conditions may be encountered.

The blow-outs have mostly been found in the working-faces of the No. 14 East slope of this mine (No. 1 East, Coal Creek) and have neither been so violent nor extensive as experienced in previous years. The work of drilling the working-faces to reduce the effect of these blow-outs still continues, and to show the perversity of human nature, the workmen sometimes complain of this work owing to the tendency to make the coal harder to mine, even although, as in one case lately, a blow-out occurred, displacing between 10 and 20 tons of coal, besides giving off a very large volume of methane.

INSPECTION ON BEHALF OF THE WORKMEN.

This inspection, as provided for by section 91, Rule 37, of the "Coal-mines Regulation Act," has been carried out regularly at all the collieries, and no occasion has arisen when the inspecting committee has deemed it necessary to make any complaints as to the conditions existing to this office as required by the same section and rule.

This work of inspection has been of great assistance to us in maintaining the conditions in the mines fairly good, and we are very much indebted to the workmen for the interest taken and the regularity of the inspection.

Searches of the workmen for matches, pipes, etc., contrary to the Act, have been carried out regularly at all the mines, and it is very pleasing to report that only in one case were matches found.

A list of the prosecutions is attached, and shows one case under the "Coal-mines Regulation Act" for having matches in possession contrary to section 91, Rule 9; one case for riding on a trip contrary to Special Rule No. 63; and five cases for failing to use sprags for the undermined coal, making a total of seven cases.

I have again to mention the inadequate penalties inflicted, especially in cases such as having matches in the mine, and when we consider the amount of damage and danger to life involved in mines with such possibilities of gas-outflow, a penalty of $5 would almost seem an encouragement than a detriment. It may be charitable to think that such penalties are due to the ignorance of the dangers of mining, but we cannot overlook the fact that hundreds of men's lives may hinge on a single match in the hands of an ignorant or careless workman.

Crow's Nest Pass Coal Company, Ltd.

Capital, $3,500,000.

Officers.	*Address.*
W. R. Wilson, President,	Fernie, B.C.
E. C. Whitney, Vice-President,	Ottawa, Ont.
R. M. Young, Secretary,	Fernie, B.C.
A. Klaner, Treasurer,	Fernie, B.C.
W. R. Wilson, General Manager,	Fernie, B.C.
Bernard Caulfield, Colliery Manager, Coal Creek Collieries,	Fernie, B.C.
Thomas H. Williams, Colliery Manager, Michel Collieries,	Michel, B.C.

The above company is now operating the following extensive collieries on the western slope of the Rocky mountains in the East Kootenay District, namely:—

Coal Creek Colliery, situated on Coal creek, about 5 miles from the town of Fernie, on a branch railway to the mines, connected at Fernie with the tracks of the Canadian Pacific Railway and also those of the Great Northern Railway.

Michel Colliery, situated on both sides of Michel creek, on the line of the Canadian Pacific Railway, being 23 miles in a north-easterly direction from Fernie.

The amount and disposition of this combined output of the company's collieries is fully shown in the following table:—

COMBINED RETURNS FROM CROW'S NEST PASS COAL CO.'S MINES FOR YEAR 1921.

SALES AND OUTPUT FOR YEAR.	COAL.		COKE.

COAL CREEK COLLIERY.

Bernard Caufield, Manager; Jas. Taylor, Assistant Manager.

This colliery is situated about 5 miles from Fernie, seven mines being operated, three on the north side and four on the south side of the Coal Creek. Connection is made at the town of Fernie with the Canadian Pacific and Great Northern Railways by the Morrissey, Fernie & Michel Railway. In addition to the coal-train, a regular passenger service is maintained for the convenience of the workmen, the majority of whom live in Fernie, while a large number of dwellings are provided at Coal Creek for those who prefer living near the works.

Nos. 1 East, 1 South, and 1 North mines are mining the No. 1 seam at different points, 10 feet of the upper portion being extracted in the first operation; Nos. 2, 3, and 9 mines are mining the No. 2 seam, which has an average thickness of 6 feet; B North is operating the

B seam, which has an average thickness of 5 feet, with 4 feet of inferior coal for a floor, part of this being taken up to allow of sufficient height for haulage. The inclination of the seams average about 12°, dipping to the east.

The tipple at this colliery is of steel construction, has a total length of 840 feet, extending right across the valley, and receives coal on both sides; it is equipped with two independent electrically driven circular dumps, which deliver the coal to feed-conveyors that supply the shaking screens. These separate the slack from the lump coal, the latter being delivered to the picking-tables, where all foreign material is picked out before it is finally loaded into the railway-cars; provision is made for loading into either open or box cars, two Smith hydraulic box-car loaders being provided for dealing with the latter.

The main power plant is situated on the north side of the valley and consists of fourteen boilers, with an auxiliary plant of five boilers on the south side; the total capacity of the whole plant is approximately 3,250 horse-power. Power to drive the compressed-air hoists and pumps underground is supplied by three compressors having a total capacity of 6,000 cubic feet of free air a minute, compressing it to 80 lb. to the square inch. There is also a Canadian Rand (high-pressure) compressor having a total capacity of 1,346 cubic feet of free air a minute, compressing it to 900 lb. to the square inch, which provides the power to drive the air-locomotives.

The electric plant consists of three generators with a capacity of 680 amperes at 250 volts, driven by two Robb-Armstrong engines, and provides the power to drive the fans at Nos. 1 South, 1 North, and B North mines, the motors on the tipple, as well as the electric light for the mine buildings, yards, and houses at Coal Creek.

A well-equipped lamp-room is located in a central position at the mines, where all safety-lamps are cleaned and repaired; this building is fully provided with all necessary appliances for keeping the lamps in a good state of repair. A large wash and change room is situated convenient to the mines, where the workmen can have a locker for a small monthly payment; these lockers are of steel construction, and the wash-house is under the charge of a workman whose duty it is to keep it in a clean and sanitary condition, the workmen providing their own soap and towel.

Copies of the "Coal-mines Regulation Act" and special rules are posted up at the colliery.

Following is a brief description of the mines and the conditions prevailing therein throughout the year:—

No. 1 East Mine.

J. Caufield, Overman; H. Dunlap, J. Duncan, J. Maltman, and T. Reid, Firebosses.

This mine is situated to the east of the tipple, the seam being reached by a drift at a distance of 215 feet from the entrance. The method of work is a modification of pillar and stall, levels being driven in pairs, each pair being separated by 150-foot pillars; after the first three sets of levels are set away the size of pillar is increased to 200 feet.

Ventilation is produced by a fan of the Wilson type, running at a speed of 148 revolutions a minute, which produces an average quantity of 120,000 cubic feet of air a minute, under a water-gauge of 3.5 inches.

A new fan has been installed during the year; the work of clearing the ground was commenced during the latter part of May, and, with the exception of the installation of the driving-motor, was completed at the end of November. The fan is an 11-foot-diameter Sirocco, calculated to deliver 300,000 cubic feet of air a minute; the fan-house and engine-room is a fire-proof building, built entirely of concrete, and measures 66 feet 9 inches in length to the centre of the shaft, is 43 feet 6 inches in width, being connected to the return airways by a shaft 60 feet deep and 16 feet in diameter.

This mine is ventilated by four splits; the quantities passing in each at the last inspection measured as follows:—North split, 180 by 80: 14,400 cubic feet of air a minute for the use of sixteen men and two horses. Second South, 370 by 70: 25,900 cubic feet of air a minute for the use of seventeen men and three horses; Burrell gas-detector, 1.1 per cent. methane. First South, 190 by 80: 15,200 cubic feet of air a minute for the use of twenty men and three horses; B.G.D., 0.7 per cent. methane. West split, 420 by 60: 25,200 cubic feet of air a minute for the use of thirty-three men and five horses; B.G.D. (not acting). Main return, 1,160 by 104: 120,640 cubic feet of air a minute for the use of eighty-six men and thirteen horses.

Throughout the year explosive gas has been found fifteen times in the course of inspection, mostly in cavities in the roof above the timbers, the soft nature of the roof making it a hard task to prevent entirely the formation of such. The percentage of methane present in the return air, as determined by the Burrell gas-detector, varied from 0.8 per cent. in the North split to 1.9 per cent. in the West split.

Conditions generally have been good all over the mine, roadways maintained in a good state of repair, and a good supply of timber kept in places convenient for the use of the workmen, while the "systematic timbering" order has been fairly well attended to at the working-faces. The mine has been kept fairly free from dust by the use of the spraying systems, and all main roads are treated with a combination of second-burnt ashes and water.

No. 3 Mine.

J. Biggs, Overman; R. Phillips, W. Brown, and E. Caufield, Firebosses.

This mine operates the eastern portion of the No. 2 seam. It is ventilated by 16- by 8-foot Wilson fan, running at a speed of 142 revolutions a minute, which produces an average quantity of 51,100 cubic feet of air a minute, under a water-gauge of 3.5 inches.

At the last inspection the ventilation was good and measured as follows: South split, 380 by 64: 24,320 cubic feet of air a minute for the use of thirty-three men and three horses; B.G.D., 1.7 per cent. methane. Incline split, 320 by 55: 17,600 cubic feet of air a minute for the use of twenty-two men and four horses; B.G.D., 0.8 per cent. methane. Main return, 890 by 60: 53,400 cubic feet of air a minute for the use of fifty-five men and seven horses.

No explosive gas has been found in this mine during the year in the course of inspection, and the percentage of methane in the return air, as determined by the Burrell gas-detector, varied from 0.7 per cent. in the Incline split to 1.8 per cent. in the South split.

A good supply of timber has been on hand at all times for the use of the workmen and the requirements of the "systematic timbering" order very well attended to at the working-faces. Roads have been maintained in good shape and the mine kept fairly free of coal-dust by the spraying systems, the main roads being treated regularly with second-burnt ashes. We have generally found conditions to be very good in this mine throughout the year.

No. 2 Mine.

C. McNay, Overman; J. Bushell, E. Ward, and W. Clarkstone, Firebosses.

This mine is on the south side of the valley and mines the south and west portion of No. 2 seam. It is ventilated by a 16- by 8-foot Wilson fan, which, running at a speed of 132 revolutions a minute, produces an average quantity of 38,750 cubic feet of air a minute, under a water-gauge of 3 inches.

The quantities passing in the various splits at the last inspection measured as follows:—Rock tunnel, 240 by 90: 21,600 cubic feet of air a minute for the use of fifty-seven men and six horses; B.G.D., 1 per cent. methane. High-line, 1,740 by 2: 3,480 cubic feet of air a minute for the use of eight men and two horses. Main return, 460 by 85: 34,850 cubic feet of air a minute for the use of sixty-five men and eight horses.

Explosive gas has been found once during the year in the course of inspection; on this occasion above the timbers at the face of the High-line level; while the percentage of methane present in the return air in the Rock Tunnel split, as determined by the Burrell gas-detector, has varied from 0.5 to 1 per cent.

Conditions generally have been good during the year; spraying systems have been maintained; these, with regular applications of second-burnt ashes on the main roads, have kept the mine fairly free from coal-dust.

We have generally found a good supply of timber kept in places convenient for the use of the workmen, while the "systematic timbering" order has been fairly well attended to at the working-faces. Roadways have been maintained in good shape and the work of repairing the main return airway still continues.

No. 1 SOUTH MINE.

F. Landers, Overman; W. Hynds, W. Stockwell, W. Morgan, and M. Hilton, Firebosses.

This mine is situated half a mile to the west of the tipple and mines the western portion of the No. 1 seam, the workings all being to the rise of the main haulage-road. It is ventilated by an electrically driven 8- by 4-foot Keith fan, running at a speed of 260 revolutions a minute, which produces an average quantity of 25,940 cubic feet of air a minute, under a water-gauge of 2.5 inches.

At the last inspection the quantity passing in the main return measured as follows: 260 by 100: 26,000 cubic feet of air a minute for the use of sixty-eight men and fourteen horses; B.G.D., 1.2 per cent. methane.

In the course of inspection explosive gas has been found eighteen times during the year, while the methane content present in the return air, as determined by the Burrell gas-detector, has varied from 1 to 1.6 per cent. Roadways have been maintained in fairly good shape, a good supply of timber has generally been provided for the use of the workmen, and the "systematic timbering" order fairly well attended to at the working-faces. Considering the amount of repair-work that is continually being done, general conditions have been fairly good during the year.

No. 1 NORTH MINE.

J. Worthington, Overman; E. Rutledge, J. Charnock, and H. Parsons, Firebosses.

This mine operates the western portion of the No. 1 seam on the north side; having a fairly good roof, and being close to the outcrop, no trouble has been experienced with gas to any great extent, and we have generally found conditions very good.

This mine is all on one split and is ventilated by an electrically driven 7- by 4-foot Keith fan, running at a speed of 210 revolutions a minute, which produces an average quantity of 21,000 cubic feet of air a minute, under a water-gauge of 1.8 inches.

The ventilation was good at the last inspection and measured as follows: Main return, 430 by 50: 21,500 cubic feet of air a minute for the use of sixty-men and nine horses. No explosive gas was found during the year in the course of inspection, roadways and working-faces have been kept in good condition, a good supply of timber generally provided for the use of the workmen, and the "systematic timbering" order well attended to at the working-faces.

The methane content in the return air has always been under 0.5 per cent., and the mine kept fairly free from dust. A considerable amount of cleaning-up and repairing has been done in the No. 9 district, with a view to making a connection with the inclines now driving up from the No. 9 mine.

No. 9 MINE.

Robert Fowler, Fireboss.

This mine is on the north side of the valley and mines the No. 2 seam. During the year the principal work has been driving the main and counter levels and repairing the return airway. It is ventilated by a Wilson fan, which, running at a speed of 50 revolutions a minute, produces an average quantity of 9,500 cubic feet of air a minute, under a water-gauge of 2.3 inches.

At the last inspection the quantity passing in the main return measured as follows: 160 by 50, 8,000 cubic feet of air a minute for the use of sixteen men and three horses.

A good supply of timber has been provided for the use of the workmen and the requirements of the "systematic timbering" order fairly well attended to at the working-faces. Roadways and working-faces are in good shape and the mine is fairly free of coal-dust, second-burnt ashes being spread regularly on the main roads.

No. B NORTH MINE.

W. Commons, Overman; Jas. Whyte and E. Jones, Firebosses.

This mine operates the B seam and is situated east of the tipple at an elevation of 200 feet above it. It is ventilated by an electrically driven 10- by 3-foot Brazil fan, which, running at a speed of 150 revolutions a minute, produces an average quantity of 42,560 cubic feet of air a minute, under a water-gauge of 1.5 inches.

Explosive gas has been found three times during the year in the course of inspection, while the methane content in the return air, as determined by the Burrell gas-detector, has varied from 1.2 to 1.8 per cent. in the No. 2 split.

Conditions have been fairly good throughout the year, roadways kept in good shape, a good supply of timber always provided for the use of the workmen, and the "systematic timbering" order fairly well attended to at the working-faces. Spraying systems have been maintained and the mine kept fairly free of coal-dust.

The ventilation was good at the last inspection and measured as follows:—No. 2 split, 240 by 70: 16,800 cubic feet of air a minute for the use of thirty-five men and three horses; B.G.D., 1.5 per cent. methane. No. 1 split, 230 by 65: 13,950 cubic feet of air a minute for the use of twenty-five men and three horses. Main return, 750 by 65: 48,750 cubic feet of air a minute for the use of sixty men and six horses.

The following are the official returns from the Coal Creek Colliery for the year ending December 31st, 1921:—

Sales and Output for Year.	Coal.		Coke.	
(Tons of 2,240 lb.)	Tons.	Tons.	Tons.	Tons.
Sold for consumption in Canada	49,535			
" export to United States	320,410			
" " other countries

* Does not include Fernie coke-ovens; not operated since April 4th, 1919.

The following shows the number of days Coal Creek Colliery worked each month during 1921:—

January	15	August	21
February	16	September	18
March	19	October	17
April	16	November	22
May	14	December	17
June	15		
July	17	Total	207

No. 1 mine worked only 10 days in December.

Name of seams or pits—No. 1 North, No. 1 South, and No. 1 East, same seam; No. B, Nos. 2, 3, and 9, same seam.

MICHEL COLLIERY.

Robert Bonar, Manager; Archibald Howden, Assistant Manager.

This colliery is situated on both sides of Michel creek, 24 miles north of Fernie, and has connection with both the Canadian Pacific and Great Northern Railways. Three mines have been operated during the year—Nos. 3 and 3 East on the south side of Michel creek, mining the upper No. 3 seam, while the No. 8 mine on the north side is operating the seam of the same name.

The general method of work is pillar and stall, rooms being turned off from the levels every 60 feet; crosscuts between rooms set off at the same distance, leaving pillars measuring 60 by 60 feet. The work of extracting pillars is being carried out to some extent in Nos. 8 and 3 East mines.

No. 8 mine being situated at an elevation of 500 feet above the tipple, the coal from this mine is weighed at the tipple at the top of the incline; then dumped into storage, from which it is loaded into skips and lowered by gravity to loading-chutes at the foot of the incline, from which it is drawn into the mine-cars and hauled to the tipple by endless-rope haulage.

The main tipple is of steel construction throughout, is 640 feet in length, and receives coal on both sides; the loaded cars from the South side being weighed at the foot of the tipple incline, up which they are taken by an endless chain-haul which travels on car wheels, the latter acting as pushers or retarders on the incline; these move in behind the rear wheels of the car, thereby conveying it up to the dump on the tipple.

This dump is simply a continuation of the track, with a pitch increasing from 20° to 60°; as the car reaches this point the door is opened and the coal discharged into the dump, the chain-haul continuing to travel around a large sprocket-wheel conveying the empty to the overhead track and back down the incline.

On the No. 8 side an automatic dump is in use, the cars being returned by a transfer underneath the track to the endless-rope haulage, which delivers them back at the foot of the incline. The tipple is equipped with shaking screens and picking-tables for separating the slack from the lump coal, the former being conveyed to storage-bins, from which it is drawn as required for the purpose of making coke, and provision is made for loading both open and box cars, two Smith gravity box-car loaders being used for loading the latter. No additions were made to the boiler plant and surface equipment during the year, a description of which was given in the 1920 Report of the Minister of Mines.

The safety-lamp in general use is the Edison electric mine-safety cap-lamp, while the Wolf is used by the bratticemen and officials for testing purposes, Burrell gas-detectors being provided to determine lower percentages of methane in the air-current than can ordinarily be detected by the Wolf safety-lamp.

Copies of the "Coal-mines Regulation Act" and special rules are posted up at the colliery.

Following is a brief description of the mines and the conditions prevailing therein:—

No. 3 MINE.

M. Littler, Overman; A. Frew, A. Davis, T. Owen, and T. James, Firebosses.

This mine is working the upper No. 3 seam, this being reached by a crosscut tunnel from the surface which intersects Nos. 5, 4, 3, and 3 East seams, the latter seam only being mined. It is ventilated by a 12- by 6-foot Sullivan fan, running at a speed of 130 revolutions a minute, which produces an average quantity of 65,670 cubic feet of air a minute, under a water-gauge of 2.2 inches.

At the last inspection the ventilation was good and measured as follows:—Main return, 1,100 by 100: 110,000 cubic feet of air a minute for the use of eighty-four men and eight horses. West side, 180 by 175: 31,500 cubic feet of air a minute for the use of forty-four men and four horses. East side, 580 by 90: 52,200 cubic feet of air a minute for the use of forty men and four horses.

Explosive gas has been found four times in the course of inspection, the quantities being small in each case and found close to the roof at the face. The percentage of methane in the return air, as determined by the Burrell gas-detector, has varied from 0.3 per cent. in the West side to 1.6 per cent. in the East side.

General conditions have been fairly good, roadways maintained in good shape, a good supply of timber being generally provided for the use of the workmen, and the "systematic timbering" order fairly well attended to at the working-faces.

Spraying systems are in operation on all roads that are inclined to be dry and dusty, and the mine has been maintained fairly free from dust at all inspections.

No. 3 EAST MINE.

M. D. McLean, Overman; A. Ball, W. Picton, R. Clarkstone, and R. McFegan, Firebosses.

This mine is also mining the upper No. 3 seam and is situated about half a mile east of the tipple. It is ventilated by a 16- by 8-foot Wilson fan, which, running at a speed of 124 revolutions a minute, produces an average quantity of 107,480 cubic feet of air a minute, under a water-gauge of 2.3 inches.

During the year explosive gas has been found ten times in the course of inspection, generally in cavities in the roof, while the methane content in the return air, as determined by the Burrell gas-detector, has varied from 1 per cent. in the No. 6 East split to 1.8 per cent. in the West split.

Working-faces and roadways have been kept in good shape, with the exception of the No. 6 East return airway, which is in need of repairs in several places. We have generally found a good supply of timber on hand for the use of the workmen and the "systematic timbering" order well attended to at the working-faces. The mine has been kept fairly free from dust by the use of water-spraying systems, second-burnt ashes being spread frequently on the main roads.

At the last inspection the ventilation was good and the quantities passing in the various splits measured as follows:—Main return, 1,760 by 63: 110,880 cubic feet of air a minute for the use of eighty-eight men and ten horses. West split, 1,060 by 50: 53,000 cubic feet of air a minute for the use of forty-eight men and five horses; B.G.D. (not acting). No. 6 East, 250 by 96: 24,000 cubic feet of air a minute for the use of forty men and five horses; B.G.D., 1.1 per cent. methane. East of slope: 520 by 40: 20,800 cubic feet of air a minute for the use of ten men. No. 6 East slant, 180 by 28: 5,040 cubic feet of air a minute; this district has been stopped for some time.

No. 8 MINE.

Thos. Baybutt, Overman; A. Almond, E. Ainsworth, J. Marsh, and R. Taylor, Firebosses.

This mine is situated at an elevation of 500 feet above the tipple on the north side of the valley and mines the No. 8 seam. It is ventilated by a compressed-air-driven 8- by 4-foot Murphy fan, running at a speed of 150 revolutions a minute, which produces an average quantity of 34,960 cubic feet of air a minute, under a water-gauge of 0.5 inch.

The quantities passing in the various splits at the last inspection measured as follows:—West side, 600 by 30: 18,000 cubic feet of air a minute for the use of fifty-two men and six horses. No. 6 incline, 450 by 40: 18,000 cubic feet of air a minute for the use of fifty-six men and six horses. Main return, 600 by 70: 42,000 cubic feet of air a minute for the use of 108 men and twelve horses.

We have not found any explosive gas during the year in the course of inspection, and the percentage of methane in the return air has been kept under one-half of 1 per cent. Roadways and working-faces have been maintained in good shape, a good supply of timber generally provided for the use of the workmen, and the "systematic timbering" order fairly well attended to at the working-faces. While the mine has been kept fairly free of dust, some method of dealing with this should be considered for the No. 6 Incline district, where some of the roadways are inclined to be dry.

The grade has been completed for a new gravity-plane to be operated from one of the upper levels which has been driven through to the surface.

The following are the official returns of the Michel Colliery for the year ending December 31st, 1921:—

SALES AND OUTPUT FOR YEAR.	COAL.		COKE.	
(Tons of 2,240 lb.)	Tons.	Tons.	Tons.	Tons.

March	23	October	16
April	18	November	22
May	14	December	21
June	14		
July	16	Total	222½

No. 3 side worked only 10 days during December.

Name of seams or pits—New No. 3 (top section of No. 3 seam); Old No. 3 (lower section of No. 3 seam); New No. 8 (Old No. 8 seam continued).

Corbin Coal and Coke Co., Ltd.

Head Office—Spokane, Wash.

Capital, $7,000,000.

Officers.	*Address.*
Rush Taggert, President,	New York, N.Y.
J. K. O. Sherwood, Vice-President,	New York, N.Y.
Wm. Weaver Heaton, Secretary-Treasurer,	New York, N.Y.
A. M. Allen, Assistant Treasurer,	Spokane, Wash.
R. S. Ord, General Manager,	Spokane, Wash.
E. L. Warburton, Mine Manager,	Corbin, B.C.

Value of plant, $400,000.

CORBIN COLLIERY.

E. L. Warburton, Manager.

This colliery is situated 14 miles from McGillivray Junction on the Crowsnest branch of the Canadian Pacific Railway, is reached by means of the British Columbia Eastern Railway, and consists of the following mines: Nos. 4, 5, and 6. No coal has been produced during the year from the No. 3 mine or "Open-cut"; the latter has been dismantled and the equipment brought down to the central yards at the colliery.

The boiler plant, consisting of two Jencks return-tubular boilers and one of the locomotive type, has a total capacity of 275 horse-power. The electric plant consists of one 70-horse-power generator, alternating type, 2,300 volts, driven by one 100-horse-power steam-engine, and provides the power to drive the motors at the machine-shops, the fan at No. 6 mine, and for lighting purposes around the town of Corbin.

The tipple, constructed of wood, has a bunker capacity of 1,200 tons and is equipped with a Marcus screen and conveyor-belt, driven by a 60-horse-power steam-engine. A lamp-room is located in a central position at the mines, where all safety-lamps are cleaned and repaired.

The lamps in use are chiefly the Edison electric type, the remainder being the Wolf-safety, the latter being used by the officials for testing purposes, while a Burrell gas-detector is provided for the detection of lower percentages of methane in the mine-air than can ordinarily be detected by the Wolf safety-lamp.

Copies of the "Coal-mines Regulation Act" and special rules are posted up at the colliery.

Following is a brief descrpition of the mines and the conditions prevailing therein throughout the year:—

Nos. 4, 5, and 6 Mines.

W. Almond, Overman; H. Osborne, Shiftboss; J. Virgo, G. Luck, G. Elmes, H. Ferryman, and E. Hardie, Firebosses.

The No. 4 mine is operating the No. 4 seam, which is vertical and varies from 50 to 200 feet in thickness. During the year the most of the coal has been taken from the 400 and 500 levels,

where the method of extracting the pillars is by the caving system on the retreat, and a fairly large area in these levels can now be mined by this method.

The only development-work done during the year was in the 300 Right level, but a considerable amount of repair-work has been done cleaning up old roadways in preparation for extracting the pillars, and at present a new road is driving through the old workings to provide better haulage facilities in the 300 level. No further trouble has been experienced with fires during the year and careful watch is maintained at the sealed-off area in No. 4 level.

At the last inspection the ventilation was good and measured as follows: Intake airway, 720 by 35: 25,200 cubic feet of air a minute for the use of twenty-eight men and two horses.

No explosive gas was found by us during the year, roadways and timbering in good shape, plenty of timber being provided for the use of the workmen, and the "systematic timbering" order well attended to at the working-faces.

This mine, being naturally damp, is free from coal-dust and conditions generally have been very good throughout the year.

No. 5 MINE.

Very little work has been done during the year. The main and counter levels have now been driven a total distance of 500 feet from the point of entry, but work was suspended in November.

No. 6 MINE.

A considerable amount of work has been done at this mine during the year, a tipple being completed, to which the coal is lowered by chutes from the various levels; a tramway has also been constructed from the railway to the upper workings, by which the material is conveyed to the mine.

An outlet has been put through to the surface from the 5,315 level, and a small Sirocco fan, estimated to deliver 10,000 cubic feet of air a minute, is now being installed at this place.

No gas has been found in this mine and conditions have been very good at all inspections; a good supply of timber being provided at all times for the use of the workmen and the "systematic timbering" order well attended to at the working-faces.

Crosscutting has proved this seam to be about 400 feet thick, and it is being blocked out double-stall method, pillars between levels measuring 70 by 120 feet.

The following are the official returns from the Corbin Colliery for the year ending December 31st, 1921:—

Name of seams or pits—No. 3 mine or "Big Showing," open-work; Nos. 4, 5, and 6 mines, underground.

Description of seams, tunnels, levels, shafts, etc., and number of same—No. 3 mine: During the year no stripping or coal operations have been attempted at this mine, same being idle all year. Shay locomotives, shovels, air dump-cars, contractor's outfit, etc., have been moved down to Corbin. No. 4 mine: During the year bulk of coal from this mine has been won from pillar-work on 400 and 500 levels by the caving-retreating system. A comparatively large area of this ground in both levels is now available for retreating; 300 Right workings have been advanced 500 feet, the coal at this point being about 150 feet between containing walls. It is not being operated just now owing to poor business conditions, which also applies to A tunnel. No. 5 mine: Level and counter have been advanced to a point 500 feet from entry, the coal being about 18 feet wide between walls. It also has been abandoned until business conditions improve. Coal at face of this level when stopped showed analysis of 0.75 moisture; 22.75 V.C.; fixed carbon, 69; ash, 7.50 per cent. No. 6 mine: At the elevation 5,315 section the rock tunnel struck coal at 150 feet, where a 12-foot seam of hard coal was found and a level driven north on same for 60 feet; the main tunnel advanced about 25 feet in shales from this point, where coal was again struck; tunnel is now advanced 200 feet in coal. A level to the south has been driven 275 feet and levels now being put off to the north. It is expected the width of seam at this point will be at least 400 feet, and running north about 2 miles with depth unknown. At the elevation 5,390 a road was driven across the seam in coal for 375 feet, the containing walls being well defined. Work to the north has been advanced 500 feet, the bed of coal being blocked out double-stall method and pillars of 210 by 250 feet, pillars between levels and counters being 70 by 120 feet. At the elevation 5,456 section roadway is now being driven across the seam and has advanced 150 feet, when hanging-wall has been reached. It is proposed to block out this upper section for retreating which will be worked on the "top-slicing method" to prevent surface material from mixing with coal. This mine can now quickly be producing 500 tons a day if necessary.

Description and length of tramway, plant, etc.—Nos. 3 and 4 mines as per previous report. No. 5 mine: Tipple shedding has been completed. No. 6 mine: Small boiler and hoist to handle timbers to different levels. Timber tramway from railway to top level, 700 feet, laid with 40-lb. steel. Wash-house temporary; three sprays and hand-basins, with change and drying room to take care of fifty men; boiler erected, 600 feet 2-inch line to water-supply, radiators, etc. Small Sirocco fan for development purposes, capacity 10,000 cubic feet a minute, against a 4-inch water-gauge. Loading-chutes from elevation 5,240 to 5,456 to lower coal to railway-track, to be replaced later by retarding conveyor. Tipple and shedding to handle run of mine from loading-chutes to railway-cars. At the main tipple, Corbin, Marcus screen and apron-conveyor have been adjusted to more adequately handle rock and clean coal.

PROSECUTIONS UNDER "COAL-MINES REGULATION ACT."

Date.	Name.	Mine.	Occupation.	Offence charged.	Judgment.
Jan. 18....	Casiso Angelo.....	No. 1, Granby	Miner	For having pipe in his possession in violation of General Rule 91	Fined $5.
Jan. 18....	B. Martinella.....	No. 4, Cumberland	Miner	For refusing to sprag coal.....	Fined $10.
Feby. 1....	John Liddle.....	No. 4, No. 1 slope, Cumberland	Fireboss.....	For not guarding place when blasting	Fined $10.
Feby. 7....	Adam Watson....	No. 5, Wellington Extension	Fireboss.....	For infraction of Special Rule 44	Fined $10 and costs.
April 30....	F. A. Gibbons	No. 3, Extension	Driver.....	For allowing a miner to ill-treat his mule	Fined $10.
April 30....	George Copp	No. 3, Extension	Miner	For ill-treating a mule	Fined $25 and costs.
June 7....	John Donnachie..	No. 1, Granby (Cassidy's)	Fireboss.....	For infringement of Rule 12, C.M.R. Act	Fined $10 and costs.
June 14....	Telephore Janard.	Extension	Labourer.....	For forging a coal miner's certificate of competency	Fined $50.
Oct. 3....	J. Tabacak	No. 2, Coal Creek.	Miner	Failing to sprag undermined coal, contrary to Special Rule 115	Fined $5 and costs.
Oct. 5....	J. Bisoni	No. 1, East, Coal Creek	Miner	Failing to use sprag for undermined coal, contrary to Special Rule 115	Fined $5 and costs.
Oct. 5....	T. Chubra.....	No. 1, East, Coal Creek	Miner	Failing to use sprags for undermined coal, contrary to Special Rule 115	Fined $5 and costs.
Oct. 18....	Harry McGuire...	No. 1, North, Coal Creek	Miner	For having matches in his possession	Fined $5 and costs.
Nov. 21....	Jew Yoy	No. 4, Comox.....	Chinese labourer	For infringement of Rule 9, C.M.R. Act	Fined $10.
Nov. 21....	Andrew J. Alber..	Granby (Cassidy's)	Miner	For infringement of Rule 9, C.M.R. Act	Fined $5.
Nov. 24....	R. Miza.....	No. 5, Comox....	Miner	Having matches and cigarette-papers	Fined $10 and costs.
Nov. 25....	John Farrow	No. 3, East, Michel	Miner	For riding on trip contrary to Special Rule 63	Fined $10 and costs or 30 days.
Nov. 25....	M. Rubos	No. 3, Michel.....	Miner	Failing to sprag undermined coal, contrary to Special Rule 115	Fined $10 and costs or 30 days.
Nov. 25....	T. Tonkin.....	No. 3, Michel.....	Miner	Failing to sprag undermined coal, contrary to Special Rule 115	Fined $10 and costs or 30 days.
Dec. 5...	John Jonas, Jr....	No. 1, Granby	Rope-rider	Having matches in his possession in violation of General Rule 9.....	Fined $10 and costs.
